Business people were usually viewed as lower than agricultural and/or manufacturing classes although they were much richer than the others. Commercial activities were usually regulated by the government, meaning the government granted privileges to certain people to maintain commercial activities in specific fields and/or areas. In particular, government procurement needs and official trades with foreign countries could be met only by those who were granted the privileges by public officials. Public officials might use discretionary power in designating particular businesses as suppliers to the government. In return for the privilege, businessmen had to pay the political fund which was needed by the aristocracy. This kind of exchange relationship was both formal and informal, and thus it might be a major source of corruption. The growing competition among business groups to acquire the privileges made the bribery to public officials a common phenomenon, which is typically seen in the predatory state as pointed out by Evans.^[2] A close tie between political elites and businesses were maintained for long period of time, sometimes over many generations, and became institutionalized with varying degrees from countries to countries and from time to time. Thus government–business relations in East Asia during the preindustrial era can be characterized by a long-term enduring cooperative relationship based upon the exchange of political protection for business privileges and the ruling fund to the aristocracy.

Industrialization and Government–Business Relations

Ever since the introduction of the capitalist market economy, governments in East Asian countries played leading roles in the economy mainly to catch up the advanced industrial countries. Although there has been much debate about the role of the state in East Asian countries, scholars generally agreed to the argument that the state was critical in achieving the rapid industrialization.

Japan, for instance, industrialized itself after the Meiji Restoration in 1867, and became a colonial power in East Asia. The ruling elites in the early constitutional monarchy needed cooperation from the business to implement their expansionist policies toward Korea and Manchuria. Later it was changed into the military-based totalitarian regime, and maintained very close ties with big businesses called the *zaibatsu*. The government provided them with ample opportunities to maintain lucrative businesses in the colonial Korea and Manchuria. In return, those businesses served as material bases for the war economy since the 1930s. After the World War II, the Japanese government repeated its prewar legacies to revitalize

its devastated economy. The Ministry of International Trade and Industry (MITI), was at the center of the mixed market economy as Johnson argued.^[3] The collaboration between the MITI and the businesses was essential in bringing about the Japanese resurgence as an economic powerhouse in East Asia in the postwar period. Industrial policy and administrative guidance were both formal and informal instruments that enabled the government to exercise power and influence over the business and industry associations. Stable political regime under the ruling Liberal Democratic Party (LDP) also contributed to the continuation of close government–business ties.

Korea resembled the Japanese type of government–business relations partly due to the colonial legacies. Japanese corporate management style and *zaibatsu* type of business structure were introduced in Korea throughout the colonial period (1910–1945), and the founders of virtually all Korean big businesses were former workers of the Japanese firms operating in Korea. Japanese colonial rule and later the Korean War deprived the landed upper class and the ruling class of the opportunity of exercising power and influence over the formation of the capitalist market economy after 1945. In addition, the American Military Government and the subsequent Rhee government privatized most of the assets formerly owned by Japanese government and corporations during the colonial period. Because there were not many people who could run modern businesses, the privatization simply meant a creation of the new capitalist class in the Korean society (for the legacies of Japanese colonial rules, see Ref.^[4]).

The following Park Chung Hee government (1961–1979) was a military authoritarian regime, and undertook aggressive export-oriented policies toward rapid economic development. Every year, export targets for various industries and even those of big firms were set, and individual firms were forced to meet the targets. The heavy and chemical industrialization adopted in the 1970s was the apex of state dominance over the business, which resulted in a rapid concentration of capital. During this period, the government selected six strategic industries (steel, chemical, non-ferrous metal, machine building, shipbuilding, and electronics), and firms in those industries were financed by huge sum of policy loans.

Taiwan shows similar government–business relations although its economy has been more market oriented than that of Korea. Like Korea, Taiwan was a former colony of Japan (1895–1945). Before 1945, Japan promoted agriculture and small businesses, which made Taiwan “the most agriculturally, commercially, and industrially advanced of all provinces of China.”^[5]

When the Kuomintang (the Nationalist Party) entered into Taiwan in 1949, it decided to acquire all

Japanese-owned industrial assets, and made them the material bases for the Party's ruling. The Kuomintang regime emphasized the separation between political and economic spheres to prevent corruption. As a result, major big businesses were directly owned by the state, while small- and medium-sized enterprises were free to compete with each other.

Taiwan's industrialization efforts were similar to those of Korea with much emphasis on agriculture and small businesses. And Taiwan was far more active to invite foreign direct investments than Korea in order to create the vested foreign interests on the island of Taiwan. This was the case because the Taiwanese viewed the security danger was more serious than Korea, where the American troops were stationed.

Taiwanese government adopted a series of 4-year economic plans, which emphasized different aspects such as economic rehabilitation (1953–1956), growth of national income and investment (1958–1961), heavy industry development (1961–1964), and electric appliances and electronics (1965–1968). These plans served as ultimate guidelines of the pathways of the Taiwanese economy for the businesses. Especially, Taiwanese government put much emphasis on developing high-tech industries since the 1970s. Creating the Hsinchu Science-based Industrial Park, the Electronics Research Service Organization, and the Industrial Technology Research Institute were direct government initiatives to invite private investments in high-tech industries. In short, the Taiwanese government was also a typical developmental state, and the government–business relations were cooperative in nature with clear upper hand on the part of the former.

China is the most recent late developmental state, and thus state dominance over the business is still preeminent. China has maintained annual average economic growth rates of 9% since the economic liberation and reform in 1978. In the past, the communist China maintained a planned economy with state-owned enterprises. Since the adoption of the commercial economy with planning (1978–1991) and the socialist market economy (1992–present), many state-owned enterprises were privatized. But key big enterprises are still under the firm control of the state because the government owns significant portion of stocks. Deregulation was the most important cause of rapid economic growth by stimulating free business activities on the part of the private enterprises. China became a member of the WTO in December 2001, which made its economic system more close to global standards. Foreign direct investments to China increased dramatically since then. Since 2006, Chinese foreign direct investment also increased rapidly through M&A in order to acquire advanced technologies and export market at the same time.

Government–business relations in China after the reform and liberalization can be divided into two different periods. The early stage of reform (1979–1990) emphasized the transfer of management under the condition that collective ownership maintained. Enterprises were free to manage themselves to create more profits, and certain portion of the profits could be withheld within the company. This might serve as an incentive for higher productivity. In the 1990s, China adopted the principle of building the socialist market economy. In order to accomplish this, collective ownership of enterprises should be amended (1992–present). Since then, the Chinese government adopted the modern corporate system, meaning that the stock system was introduced to reform the state-owned enterprises. But this does not mean that the ownership of the state-owned enterprises is privatized completely. Rather, the government maintains control over the former state-owned enterprises by holding significant portion of stocks. However, the management is completely separated from the government, and the enterprises can mobilize huge sum of investment funds through the stock market. Recently, M&A is also actively promoted to make globally competitive big businesses. In short, big state-owned enterprises are being transformed into stock-based corporations, while small- and medium-sized enterprises are privatized to allow M&A and other business activities. At the center of these reforms is the strong government which leads the reform toward the socialist market economy.

Sources of Government Dominance Over Business

Government dominance over business has been formed through the historical conditions and circumstances, and strengthened by institutional arrangements that allow the government to perform the roles of the developmental state.

First and foremost, all East Asian governments are strong authoritarian regimes during most of industrialization periods, and maintained stable political regimes. In Japan, the government was not so authoritarian, but the semitenured dominance of the LDP was essential in the collaboration between government and business. This was possible partly due to the strong and long-lasting ruling coalition among the LDP, the agriculture, the business, and financial capital. The Cold War politics and outstanding economic performance of the ruling party also contributed to the political stability of the LDP regime.

Korea and Taiwan shared geopolitical characteristics, which contributed to the formation of the military authoritarian regimes. China also had the Communist Party-dominated strong government. This certainly

contributed to the government dominance over the business.

Second, at the early stage of industrialization, the government was the only organization to push industrialization ahead with necessary knowledge and information. Private businesses were usually small and underdeveloped, and they did not have appropriate information and knowledge for systematic industrialization. Even relatively big businesses could not mobilize necessary funds for investment without the government's repayment guarantee. Thus, the government played the role of patron for the infant stage of industries and businesses.

Third, in all the East Asian countries, the best elites in society filled the government, economic institutions, and other related organizations. Strong economic bureaucracy that was filled with the best elites in society made long-term economic plans and implemented them throughout developmental periods. The government also controlled the banking sector that was critical for credit allocation. The best talented bureaucrats with the power of credit allocation to the private sector could dominate over the business with a series of developmental plans to achieve unprecedented economic and industrial growth.

But it is basically cooperative relationship rather than unilateral coercion. Close social networks among elites were also critical in understanding the government–business relations. In fact, most of leaders' positions in society including the government, business, industry associations, financial institutions, political parties, and the Parliament, were filled with the graduates of a handful of best universities. They usually had intimate interactions, and often helped with each other to accomplish developmental goals.

Economic bureaucrats in Japan, and to a less extent in other East Asian countries as well, also enjoyed the benefits of *amakudari*, meaning that former economic bureaucrats could be appointed in high positions of the private business and/or industry associations. *Amakudari* certainly provided additional communication channel between government and business and making the relationship much smoother.

Fourth, East Asian governments possess effective policy tools to check the business and to force them when it is necessary. Usually, the government exercises its influence based upon mutual understanding and collaboration. But when the businesses do not voluntarily follow government policies, the government has effective policy tools to enforce them. The most powerful one would be the prosecutor's authority. Because the owners and managers of big businesses need to maintain close ties with political communities, most of them are not free from political corruption. Another very effective policy tool is the control of the central bank. In the developmental state, the government

effectively controls the banking sector, and bank credits might be distributed based upon policy purposes. For example, the Korean government controlled the domestic and to a lesser extent, foreign loans, and allocated the available credits based upon the developmental needs. China, on the other hand, possesses another powerful policy tool based upon the large state ownership as described above.

Fifth, in all East Asian countries, industrialization began with the import substitution of the formerly imported products. Export-led industrialization of labor intensive items such as textile, apparel, and footwear, and the deepening of import substitution called the heavy and chemical industrialization began at different times and with varying degrees. Japan in the 1930s and again in the 1950s, and Korea in the 1970s were comparable in this regard, while Taiwan did not take full initiative in promoting the heavy and chemical industries. Foreign direct investments were invited as much as possible, while Korea had to build up a huge foreign debt as well in order to make up the needed investment funds. The industrial policies of this magnitude could not be lasted long had it not been for the autonomy and capacity of the government. A very cooperative government–business relationship with the dominance of the government was a prerequisite for late industrialization.

Sixth, international contexts were also favorable to the government–business relations of this type. Korea and Taiwan after the World War II were in a constant security danger. The security alliance with the United States provided diverse geopolitical advantages such as huge military and economic aids as well as privileged access to the American market. When the security commitments by the United States had weakened in the 1970s, Korea and Taiwan had to find out their own ways to maintain the credibility from outside. Korea went into the heavy and chemical industrialization along with the *Yushin* system, a dictatorship by President Park Chung Hee, while Taiwan tried to invite foreign investments as much as possible in order to increase the vested interests of the foreign capitals on the island of Taiwan. Under this situation, the government must be very strong and autonomous, and perhaps dominant over society and business.

China is an exception in this regard. It has been one of the superpowers in the region and never been in the security danger. Major Chinese reforms occurred after the demise of the Cold War politics. Thus, the Chinese economic and industrial policies could be concentrated on the economy.

In short, government–business relations in East Asian countries can be characterized by the strong dominance on the part of the government over the business. Yet, the government dominance should be supplemented by the close cooperation with the business.

BEYOND THE DEVELOPMENTAL STATE

Sources of Changing Government–Business Relations

The very economic success of East Asian countries became a source of decreasing government's power and influence over the business. As the economy grew, the government tried to build up big businesses considering the economy of scale. Big businesses could develop a worldwide production networks and marketing channels, and they no longer follow the government leadership in business decisions. At the same time, the government began to lose its competitive edge in setting specific targets for industries and even individual firms, simply because the market changes so fast and public officials could not get the necessary data and information to make appropriate decisions as fast as the business does.

As economic affluence was in common, people with higher education increased over time. This stimulated the rise of the middle class who were more liberal and active in social issues. Labor unions, which had been exploited and sacrificed for the fast economic development, no longer sit down without resistance. It was around the mid-1980s when full-scale democratization occurred both in Taiwan and in South Korea. Democratization was a fundamental source of changing the role of government and the government–business relations in East Asia. Providing ruling funds in return for favorable economic policies was increasingly difficult due to the growing demand for more transparent political processes. Political stability, which contributed to capital investments by reducing the uncertainty of the future, was disappeared. The honeymoon period between political elites and business leaders gradually came to an end.

In addition, demand for the redistribution of the accumulated wealth grew rapidly throughout society. Various non-governmental organizations began to criticize the concentration of capital by a few big business groups (e.g., *chaebols* in Korea). The close ties between government and business, which once served as an institutional condition for rapid economic growth, were blamed as a source of corruption.

While the power and influence of the government decreased significantly, the business was relatively free to engage in active rent seeking. They no longer follow what the government wanted them to do unconditionally. In some cases, business interests might not be the same as national interests as Vernon once points out in the case of multinational corporations.^[6]

The demise of the Cold War politics in 1989, and the increasing globalization thereafter also contributed to the diminishing role of the government in the economy and society. The geopolitical advantages that East

Asian countries had enjoyed such as the infant industry protection, the strategic industrial targeting, the most favored nation principle, and so on, were no longer available to them. In fact, industrial targeting, once common in East Asian countries to promote specific industries, was largely prohibited by the WTO as unfair trade practices. They were asked to play the role of the advanced countries, and Korea joined to Organization for Economic Cooperation and Development (OECD) in 1995, officially graduated from the status of the newly industrializing country.

In late 1997, East Asian countries, especially Korea, were severely hit by a financial crisis. The government once again played a dominant role during this period although it had to strictly follow the IMF's guidelines. Many local firms with high debt–equity ratio had to be sold out to appropriate buyers, and structural adjustment in the banking sector was followed. As shown in the process of overcoming the crisis, the developmental state in Korea did not retreat but revived. A full-scale economic liberalization was followed thereafter, due to which the government–business relations increasingly became pluralistic comparable to those in the western societies.

Globalization, Information Technology Revolution, and Government–Business Relations

Information technology (IT) development also stimulates the changing roles of government and government–business relations. As IT develops, the role of the state in the information era is being discussed. Because the IT revolution comes with globalization and neo-liberalism, many advanced countries began to adopt IT as a key tool to reform and downsize the government and public sectors. As a result, small but efficient governments with active citizen participation through the cyberspace become popular phenomena. E-government and e-democracy are now changing the mechanism of governing from government to governance. As a reflection of this trend, a special issue of *Daedalus* in 1995 published a series of articles with the titles such as “diminished nation-state,” “defective state,” and “decline of the nation-state.” Articles appeared in *Daedalus* commonly argue that information society and globalization would substantially reduce the role of the government, while those of the private sector such as private firms, financial capital, non-governmental organizations, and individual citizens are relatively increased.^[6]

The formation of WTO was a signal for the world market with free trade principle. Numerous bilateral free trade agreements are being actively negotiated. Due to the IT revolution, economic transaction can

be taken place anytime and anywhere at light speed. Under this changing business environment, the role of government and government–business relations had to be changed dramatically.

Protection of domestic businesses is neither possible nor desirable. In fact, the separation between domestic and international markets (or firms) is no longer meaningful. Government's policy tends to invite more competition, and should guarantee fair competition among businesses regardless of their national origins. Job creation is the number one concern for most countries, according to which governments try to provide as much incentive as possible to invite more foreign direct investments. Even domestic firms will go out to look for better places for investment, which may result in further loss of valuable jobs. In short, the government would not be a dominant player in the economy any more. More diversified roles of government are expected in the future, and so does the government–business relations. Huge multinational corporations can enjoy relative independence from government, while small and medium enterprises need more assistance and perhaps guidance from the government.

CONCLUSION

East Asian countries are typical late developers and share important commonalities in their government–business relations. At the early stage of development, a politically stable authoritarian government dominated the business to achieve developmental goals. Although there were close ties between government

and business, the government exercised a clear upper hand in their relationship. As development proceeds, however, government–business relationship changed gradually from dominance to partnership, due to the growing middle class and democratization that weakened the autonomy and capacity of the developmental state. But the government in East Asian countries may play more direct and aggressive roles whenever it is necessary as shown in the process of overcoming the financial crisis. Overall, roles of government in the economy and the government–business relations seem to be diversified due to the changing business environment such as globalization and IT revolution.

Government-Sponsored Enterprises (GSEs)

Stuart C. Strother

Steven G. Koven

School of Urban and Public Affairs, University of Louisville, Louisville, Kentucky, U.S.A.

INTRODUCTION

Government-sponsored enterprises (GSEs) are large financial institutions that function in secondary finance markets for the purpose of making credit more available to borrowers for home mortgages, agricultural loans, and student loans. Originally established by the federal government, most GSEs are now privately owned, although they still retain many characteristics of a public agency. Most GSEs are restricted by law to function only in the secondary market—they purchase or guarantee loans originated by primary lenders such as banks, thrifts, and mortgage banks. Because they have little direct interaction with the general public, GSEs function under the radar screen, but they are some of the world's largest financial institutions. Three of the major GSEs—the Federal National Mortgage Association (Fannie Mae), the Federal Home Loan Mortgage Corporation (Freddie Mac), and the Student Loan Marketing Association (Sallie Mae)—consistently appear in *Fortune's* list of the 500 largest companies. In this article, we describe the creation of the GSEs, explain how GSEs function, explore the public and private characteristics of GSEs, and note some current issues facing GSEs.

THE BEGINNING OF GSEs

The first GSEs, collectively called the Farm Credit System, were created by the federal government in 1916 to help stabilize financial fluctuations in the farm sector of the economy. The individual enterprises that comprise the Farm Credit System as well as other enterprises are shown in Table 1. The Farm Credit System was designed to “encourage the flow of credit for farm mortgage loans . . . make farm operating loans . . . and lend to agricultural producer cooperatives.”^[1] Farm Credit System institutions functioned as “cooperatives owned and controlled by the borrowers.”^[1] Wild fluctuations in agricultural operations were smoothed out primarily through the organizational structure of the Farm Credit System, rather than through outright government subsidies of farmers.

Housing-related GSEs have their origin in the federal government's post-Depression efforts to rebuild

the national economy. After the collapse of the national housing market, which was characterized by numerous mortgage defaults by borrowers, local bankers grew discouraged from investing in home loans. Government officials were convinced that access to affordable housing and higher levels of home ownership represented key components to a national economic recovery from the Great Depression. To spur such a recovery, the Federal Home Loan Bank System (FHLBS) was created in 1932. The objective of the FHLBS was to provide loans, called “advances,” to financial institutions such as community banks. To secure advances, member banks put up collaterals such as traditional mortgages, agricultural loans, and small business loans. The FHLB system consists of 12 banks. The FHLBS is not publicly traded, but is owned by over 8000 member institutions that hold equity stakes. The increased availability of funds made possible by this arrangement allowed member banks to offer more home mortgages to their customers.

Another GSE, the “Fannie Mae,” was created in 1938 as a latent component of President Franklin D. Roosevelt's New Deal.^[2] The goal of Fannie Mae was to enable local banks to make more loans for purchases of private homes. If private banks would agree to make low interest home loans to individuals, Fannie Mae would purchase these mortgages with federal funds, thereby assuming all of the investment risks. Once private home loans were guaranteed by the federal government, local banks were able to extend credit to individuals without danger of loan default. This arrangement worked well and Fannie Mae's purchases of mortgages became known as the “secondary mortgage market.” With the backing and strength of the federal government behind them, private banks again invested in home loans, resulting in higher rates of home ownership.

As part of President Lyndon B. Johnson's efforts to streamline the federal government during the Vietnam era, Fannie Mae was sold to shareholders and became a privately owned enterprise in 1968. Fannie Mae's mortgage-backed securities (MBS) operations were retained in the newly created federal agency, Government National Mortgage Association (“Ginnie Mae”). Ginnie Mae operates the federal government's MBS programs, which are described below. For three

Table 1 Comparison of major GSEs

Enterprise	Established	Ownership	Key function
Farm Credit System			
Federal Land Banks	1916	Privatized in 1968	Encourage credit for farm mortgages
Federal Intermediate Credit Banks	1923		Make farm operating loans
Banks for Cooperatives	1933		Make loans to cooperatives
Federal Home Loan Bank System	1932	Over 8000 member institutions have equity ownership since 1951	Provide advances (loans) to member institutions (banks, credit unions, and thrifts) so they will offer more home loans
Fannie Mae	1938	Publicly traded private company since 1968	Make home loans more available to individuals by purchasing mortgages from primary lenders in the “secondary market”
Ginnie Mae	1968	Federal agency within HUD	Operate the federal government’s mortgage-based securities program
Freddie Mac	1970	Publicly traded private company since 1970	Same as Fannie Mae
Sallie Mae	1972	Publicly traded private company since 1972	Make student loans more available to individuals by purchasing student loans from primary lenders
Farmer Mac	1988	Publicly traded private company since 1988	Guarantees mortgage-backed securities to make agricultural loans more available

Source: Refs.^[1,6]

decades, Fannie Mae had operated as a monopoly in the secondary mortgage market, but in 1970, Congress created another GSE, the “Freddie Mac.” Freddie Mac conducts the same financial functions as Fannie Mae, including buying loans from primary lenders, advancing funds to lenders, and issuing debt obligations (bonds).

In 1972, Congress created another GSE, the “Sallie Mae,” to provide greater financial support for guaranteed student loans. At that time, student loans were perceived as “small, expensive to service, and generally unattractive” to private lenders such as commercial banks.^[1] Like other GSEs, Sallie Mae’s primary function was to provide a “secondary market,” such that primary lenders would be encouraged to invest in student loans. Sallie Mae eventually expanded into home equity loans based on the idea that families sometimes take out home equity loans to pay for a child’s college expenses.

The Federal Agricultural Mortgage Corporation (Farmer Mac) was established in 1988 to act as a guarantor for MBS issued by private lenders and the Farm Credit System. In general, GSEs have used their access to federal agency credit markets to create greater access to capital for borrowers, and have provided greater stability in housing, agricultural, and student loans. Table 1 provides basic information about the function, ownership, and establishment of major GSEs.

HOW GSEs FUNCTION

Government-sponsored enterprises have three major functions: lending money, raising money, and community investment. With the exception of the Farm Credit System that lends directly to borrowers, GSEs mainly lend money in secondary markets. Government-sponsored enterprises “loan” funds to primary lenders (i.e., banks, thrifts, and mortgage banks) by purchasing the home mortgages or student loans that were issued by the primary lenders. Government-sponsored enterprise also make collateral loans, called “advances,” to primary lenders who can use “any acceptable market-worthy collateral” to secure the loan.^[1] Figure 1 illustrates how GSEs interact with primary lenders and investors.

To make direct loans to individual borrowers, to purchase loans from primary lenders, or to offer collateralized loans, GSEs need capital. In the beginning, GSEs received federal government capital contributions, which were later repaid or forgiven once the enterprise was fully privatized.^[1] Government-sponsored enterprises now raise funds by borrowing money through debt obligations (such as Series MM bonds), by directly selling MBS, or by guaranteeing the MBS issued by private lenders. Almost 400 private companies issue MBS, including mortgage companies (70%), commercial banks (14%), and savings and loan

Fig. 1 Interactions between GSEs, primary lenders, and investors. (From Ref.^[2].)

associations (10%).^[3] After these companies have lent money to home buyers in the form of mortgages, a number of mortgages are pooled together and sold to investors in the form of MBS. Once the pooled mortgages are sold, the GSE guarantees payment to investors even if individual home buyers default on their mortgage payment obligations. The 30-year “Ginnie Mae” MBS is a favorite of investors. It can be purchased through any ordinary securities broker for US\$25,000 and has historically yielded 4–6%. Because these are “pass-through” securities, shareholders are paid back their principal, with interest, each month over the life of the security.

In addition to improving communities through increased consumer access to homeownership, GSEs also have contributed through community investment programs. Government-sponsored enterprises have contributed billions of dollars to the affordable housing program and the community investment program. These programs provide housing subsidies for low-income and moderate-income families, and provide funding for community and neighborhood economic development programs.

ARE GSEs PUBLIC OR PRIVATE?

At first glance, GSEs appear to be government agencies, but their core functions and operations have characteristics of both public agencies and private firms.

Notable public agency characteristics of GSEs relate to mission, limitations, leadership, regulation, taxes, access to capital, and quasi-monopoly status. When GSEs were established, their stated mission was to serve a distinctly public purpose—to stimulate and stabilize the economy by providing a secure

secondary market for loans. The congressional charters that established the GSEs also limited them to perform only certain functions. Fannie Mae and Freddie Mac, for example, are “limited to providing a secondary market for residential mortgages” of specified size.^[1] Farmer Mac is limited by its charter to only provide specific types of agricultural lendings. Government-sponsored enterprise leadership also resembles public agencies in that the U.S. President appoints some members to each GSE’s board of directors. Of Sallie Mae’s board of directors, seven are elected by financial institutions, seven are elected by educational institutions, and seven are appointed by the U.S. President.^[1] Government-sponsored enterprises also resemble purely public agencies in that they are not subject to certain regulations such as securities registrations; they are exempt from state and local taxes; and, most importantly, their securities receive preferential treatment due to the implied federal government guarantee. Another public characteristic of GSEs is that they operate as quasi-monopolies—a competitor cannot compete on a level playing field with the GSEs unless they first secured a similar charter from Congress, which is highly unlikely. These public characteristics represent a competitive advantage for the GSEs, making it difficult to assess whether they are efficient providers of financial services, or if they have displaced competitors who are wary of competing against a federally subsidized enterprise.

Notable private characteristics of GSEs relate to ownership and oversight. With the exception of Ginnie Mae, the major GSEs are privately owned corporations. Like other privately owned enterprises, GSE management decisions seek to maximize shareholder wealth. Therefore the balance between the profit motive and social responsibility is a perpetual struggle

for the GSEs. In the 1970s, the HUD Secretary tried to force Fannie Mae to invest more of its resources in subsidizing loans to low-income and inner-city areas. Fannie Mae's supporters claimed that the charter did not require such subsidies, essentially arguing they are not required to give away shareholder money. Government-sponsored enterprises raise money through bond issues like a federal agency, but their decisions to loan money largely mirror a private firm's decision-making process.

CURRENT ISSUES CONCERNING GSEs

Over the past two decades, GSEs have played an increasingly important role in the U.S. economy largely due to changes in consumer investment behavior. Throughout the 1980s and 1990s, consumers shifted their long-term savings from depository institutions (i.e., certificates of deposit at banks and credit unions) into equity investments (i.e., mutual funds and stocks). With their deposits declining, banks sought new sources of money and turned to GSEs, especially the FHLBS.^[4] However, greater reliance on GSEs caused them to come under increased scrutiny and criticism. Government-sponsored enterprises have recently been chastised for wielding too much power, being too politically active, holding too much risk, and lending discriminatorily.^[5]

Those who criticize the GSEs for having too much power claim that the government "subsidies" the GSEs enjoy amount to an unfair quasi-monopoly that prevents healthy competition in secondary loan markets.^[5,6] Another criticism of the GSEs is that they are too politically active. They face only minimal oversight, which perhaps accommodated the June 2003 accounting misdeeds that resulted in the ouster of top executives at Freddie Mac.^[7] Members of Congress have suggested that oversight of the GSEs should be consolidated in one place—the Treasury Department, where the GSEs' complex books are more likely to be understood.^[8] The GSEs have responded to these suggestions by sending an army of high-powered lobbyists (mostly career politicians with little experience in mortgage finance) to Capital Hill to argue on their behalf.^[9]

Another criticism of the GSEs is that they are holding too much risk. In February 2004, Federal Reserve Chairman Alan Greenspan called for actions to prevent the GSEs from further increasing their already US\$3 trillion debt.^[10] Much of this debt comes from the GSEs borrowing money from the U.S. Treasury to fund their purchases in the secondary mortgage market. A related complaint is that GSEs are retaining too much risk in their portfolios by holding on to mortgages rather than pooling them and reselling

them.^[5] In the event a GSE defaults on its own debt obligations, U.S. taxpayers are faced with a bailout much more painful than the savings and loan bailout of the 1980s.

A final criticism of the GSEs is that they have not eliminated discriminatory lending. An empirical study by Myers^[11] concluded that "blacks and other minority group members are more likely than whites to be denied loans because their loans are less likely to be sold on the secondary market to Fannie Mae and Freddie Mac." Therefore the low-income home market is not as well served as it should be. It is likely that the profit motive of the GSEs directs investments away from housing loans for low-income home buyers and toward the more lucrative middle-income and upper-income housing loan markets.

CONCLUSION

Government-sponsored enterprises are large quasi-public financial institutions created by Congress to stabilize specific capital markets, especially the markets for mortgages, agricultural loans, and student loans. The GSEs fulfill this purpose by providing advances to financial institutions and by purchasing mortgages in the secondary market. Government-sponsored enterprises raise funds by issuing bonds and MBS, and by guaranteeing the MBS offered by private lenders. Government-sponsored enterprises have characteristics of both public agencies and private firms. They serve a public purpose, but operate based on private profitability. This hybrid organizational structure allows them to earn lucrative profits in capital markets while enjoying the stability and protection of the federal government's backing. Critics of the GSEs such as Stanton^[1] argue that GSEs have served their public purpose and have concluded their life cycle. When Congress created the GSEs, no workable exit strategy was put in place, and, consequently, GSEs have grown to be powerful financial institutions that will probably continue to play an important role in U.S. capital markets.

Governors as Chief Administrators, The Changing Role of

H. Edward Flentje

*Hugo Wall School of Urban and Public Affairs, Wichita State University,
Wichita, Kansas, U.S.A.*

INTRODUCTION

The independently elected chief executive represents a unique American contribution to modern democratic governance. The role of such executives including presidents, governors, and mayors among others in the administration of U.S. governments has evolved dramatically over the course of U.S. history. In the early days of the nation, distrust of government and executive power limited the scope of government and severely restrained the authority granted to elected executives. The progressive movement at the beginning of the twentieth century initiated an enlargement of executive powers, including gubernatorial powers, and this trend has continued in ebbs and flows to the present day. Today, governors—more than any other state officials—are held politically accountable for directing the administration of state government.

BACKGROUND

In its purest form, the role of governor as chief administrator is founded on progressive-era ideals; that is, the public interest in administering state government may best be served through rule of law, hierarchical structures, division of labor, specialized competence, and the insulation of administration from politics.^[1] Rule of law, including written rules and regulations promulgated to interpret the law, assures that administration will be conducted within the bounds of the law. Hierarchical structures unify administration and centralize executive control. Hierarchy also provides the rationale for extending executive control. Division of labor rationalizes executive functions by purpose or process and guides executive reorganization. Specialized competence calls for selection of administrative personnel based on considerations of merit, such as education, experience, and expertise. Insulating administration from politics assures that administration will be conducted free of political influence and corruption by narrow special interests. These ideals provide a model of the “one best way” to conduct gubernatorial

administration and give guidance to the governor’s role as chief administrator.

This model of gubernatorial administration has been applied in state governments at different times and stages, often in fits and starts, throughout the twentieth century. Application of the model received preeminence with the emergence of the modern governorship in the last half of the century. Larry Sabato, who described this transformation of the U.S. governorship as “Goodbye to Goodtime Charlie,” found governors serving between 1950 and 1975 to be “younger and better educated” with preparation for office “more thorough and appropriate” than ever before. Within the executive sphere, these governors were successful not only in “orchestrating constitutional revisions and reorganizations but also in consolidating and fortifying their control of administration.” Most institutional obstacles formerly in the way of governors “have been dislodged and swept away.” Governors gained “appointive powers where it really matters, at the top-levels of state government . . . [T]he strengthening of the executive budget and other planning and management tools have consolidated the control of the chief executive over state administration.” As a result, fewer of this modern new breed of governors “are being defeated because of political and administrative incompetency.”^[2]

Governors in this period became evangelistic in asserting their role as chief administrator of state government. For example, interviews of 15 former governors who served their terms between 1965 and 1979 saw the managerial role to be “the most important facet of the office.” The governors interviewed were emphatic, for example: Edwards of South Carolina: “. . . The management role is really where the meat of the Governor’s office is Without management, you have practically no leg to stand on.” Exon of Nebraska: “To me, that’s number one—being a good manager . . . more important, I think, than programs or anything else.” Rampton of Utah: “. . . if a Governor is going to do his job, he has got to be the manager.” Walker of Illinois: “What counts is management . . . we have to get the Governors to concentrate on

management.” Wollman of South Dakota: “...if a Governor doesn’t devote a high percentage of his time—over half of his time—just to executive management functions, he is really missing the boat.” Each governor interviewed emphasized the governor’s role as manager from his own perspective; none denigrated its import.^[3]

During this period, the same exuberance for the governor’s administrative role permeated the work of the governors’ vehicle for collective action, the National Governors’ Association (NGA). This enthusiasm was transmitted to new governors by NGA through biennial seminars and through *Governing the American States: A Handbook for New Governors*. Over half of the NGA handbook is dedicated to guiding governors on topics such as office organization and management, staff development, selection of cabinet officials, policy and budget development, time management, and reorganization, among other topics. The volume prescribes guidelines for relating to cabinet members, avoiding staff-line conflicts, and keeping records within the governor’s office. The chapter on reorganization states that “reorganization is usually a high priority” and outlines reorganization actions “to increase the Governor’s executive authority and management capacity,” such as expanding the governor’s appointment power, reducing the number of statewide officials chosen by popular election, eliminating fixed terms of office for cabinet members, ensuring appointees serve at the pleasure of the governor, and eliminating boards and commissions that operate state agencies.^[4]

POLITICS OF GUBERNATORIAL ADMINISTRATION

The idealized view of gubernatorial administration shapes the governor’s role as chief administrator but reflects some degree of political naiveté. Governors conduct their administrative role through the exercise of administrative powers, such as the power of appointment, fiscal power, the power of organization, and the power of command. Most state constitutions provide for administrative powers that are *separate*, yet *shared* between the governor and legislature. A governor’s unique constitutional status and independent political base allow the exercise of administrative powers separately from and independently of the legislature. The open-ended constitutional language defining the powers of chief executives gives governors an advantage in the exercise of administrative power. However, administrative powers are shared in the sense that a legislature may also act in the administrative sphere if it so chooses—a situation that makes the exercise of administrative powers competitive and interdependent. Further, as executive powers have

expanded, the legislature’s capacity for oversight of state administration has also increased.

Gubernatorial exercise of administrative powers also immerses a governor in bureaucratic politics. According to one observer, state bureaucracies “tend to be creatures of habit, inflexible, and enmeshed in the process of administering ongoing programs. Around them emerge a complex of interest groups and legislative supporters, all committed to the survival and growth of extant bureaus and their programs.”^[5] These triangular alliances of state bureaus, organized clientele groups, and legislative friends represent potent forces in U.S. politics and a formidable challenge to gubernatorial direction of state bureaucracies. Any governor who takes seriously his role as chief administrator can expect to contest toe-to-toe with the iron triangles of state bureaucratic politics. In sum, state constitutional frameworks and state politics place the governor’s role as chief administrator squarely in the political realm, which may be seen more clearly by examining the primary administrative powers.

POWER OF APPOINTMENT

The power most fundamental to the role of governor as chief administrator is the power of appointment—the power to hire and to fire executive officials. Other administrative powers in large measure flow from the power of appointment. The legislature may share in the appointment powers by enacting legislation that: 1) removes positions from gubernatorial appointment through the creation of independent boards and commissions or independently elected offices; 2) limits gubernatorial removal by placing certain administrative positions under civil service status or giving them terms of office; 3) requires legislative confirmation of gubernatorial nomination to certain positions; 4) establishes specific statutory criteria for appointment to certain positions; or 5) enacts such restrictions in some combination. Constitutional provisions may also restrict gubernatorial powers of appointment, but constitutional and statutory restraints are slowly being removed. In 1955, for example, 337 state officials elected independently from the governor headed state agencies in the 50 states; as of 1994, that number had declined to 260, a decrease of 23%.^[6]

The active exercise of appointment powers also has political ramifications for governors.^a Governors making key administrative appointments based on

^aNumerous references to the political difficulties encountered by individual governors in exercising administrative powers follow and may be found in various sources, including Refs. ^[3,5,7–9].

considerations of specialized competence, managerial skill, education, and experience may cause antagonism within their state party organizations. For example, retaining a competent agency head from a prior administration of the opposing party may offend partisans in the governor's party. Merit-based appointments to cabinet positions may preclude the use of patronage in those departments and, if appointees are recruited from out of state or from outside state service, irritate current state employees. More difficult politically than selection is the removal of key officials. According to one former governor, "Nothing can bedevil an administration more than weaknesses among appointees." According to another, "If they're bad, you get more minuses for their being really bad than you get pluses out of their being good."^[3] Outright firing of a department head in order to change policy direction in a department may unify clientele groups, loyal bureaucrats, and legislative allies to protest gubernatorial action and, if a replacement is not quickly in place, lead to political havoc wrought by a runaway bureaucracy.

FISCAL POWER

The power of the purse—the power of governors to direct or substantially influence levels of state spending and revenue raising—is essential to the governor's role of chief administrator. While state constitutions grant legislatures primary powers over taxing and spending, the fiscal powers of governors evolved significantly during the twentieth century. Through statutory assignment, governors and their appointees now dominate budget making, that is, recommending an annual plan for expenditures, revenues, and year-end balances. Governors may also enforce their fiscal recommendations through use of veto powers—outright veto of appropriations bills, line-item vetoes, or the threat of vetoes. While legislatures jealously guard their control over power of the purse through more detailed line items, appropriation riders, "veto-proof" appropriation bills, and various mechanisms designed to oversee expenditures, governors and their appointees have substantial discretion to shape spending decisions once appropriations are authorized. A number of governors also have statutory authority to exercise spending discretion among line items, impound funds, or make mid-year spending reductions when revenue falls short of projections or for other statutory purposes. Further, state statutes often grant executive agencies "off-budget" fiscal powers, such as raising various fees and charges, accepting non-state funds, and issuing debt, among others, and these powers are susceptible to gubernatorial control or influence.

A governor's struggle with the legislature for control over power of the purse has political consequences. For example, between 1951 and 1975, 21 incumbent governors were evicted from office through elections in which the key issue was a tax initiative of the governor.^[2] Governors can survive a general tax increase, but the survivors list is a short one. On the expenditure side, most studies of state budgetary processes show a contest of competing interests—clientele groups, agency advocates, legislative spokesmen, and other political interests. This contest promotes decision rules for the budget process that do not seriously question existing operations of state agencies. Governors who want to enter this fray and seek substantial fiscal change will be required to expend considerable political capital, and even then, they may be faced with embarrassing budgetary defeats. Another political bugaboo for most governors is the necessity to recommend periodic salary adjustments for state employees that will likely be perceived as too little on one side and too much on the other. Those governors seeking to reward managerial performance may also be stalemated by the egalitarian instincts of legislatures to spread limited salary funds to more employees at the lower end of the salary schedule and reduce compensation for managers.

POWER OF ORGANIZATION

The power of organization—the power to create and abolish offices and to assign and reassign purposes, authorities, and duties to these offices—is critical to the governor's role as chief administrator, for it may be used to confer organizational status and give certain public purposes, programs, and constituencies higher priority and visibility than others. The legislature holds primary authority to create state offices and prescribe duties and responsibilities for such offices and, therefore, shares substantially in the power of organization, but gubernatorial powers of organization are on the increase. In 1955, only two states granted governors such powers, but as of 1994, 23 states granted governors authority to initiate executive reorganization subject to some form of legislative review.^[6] Moreover, within the bounds of state statutes and appropriations, most governors and their appointees have broad discretion in exercising the power of organization, for example, in establishing a cabinet and mechanisms to coordinate major state agencies, reorganizing administrative operations within agencies, creating gubernatorial task forces and study commissions, and assigning supplementary duties of gubernatorial priority to certain offices, among others. The gubernatorial power of organization may be

applied to achieve policy objectives or for purposes of management.

Gubernatorial action in the organizational arena commonly runs into direct and immediate conflict with the iron triangles of bureaucratic politics, and many reorganization proposals can be found in the political graveyards of state government. Most often, exercise of the power of organization will be vigorously opposed by elements in the legislature, by interest groups, from within the bureaucracy, or by a combination of these forces. Such actions will likely be denounced as a “power grab” or as attempts to import the ideas of out-of-state experts and associations. The politics of reorganization are well summarized by the late Robert Bennett, former governor of Kansas:

... during the election campaigns there wasn't a candidate of either party ... that didn't proclaim loud and clear that he was for reorganization, he was going to abolish unneeded activity, he was going to merge ... duplicating departments, he in fact was going to streamline government. In the abstract, it is without a doubt, one of the finest and one of the most palatable theories ever espoused by a modern day politician. But in practice ... it becomes the loss of a job for your brother or your sister, your uncle or your aunt. It becomes the closing of an office on which you have learned to depend for a small portion of your municipal economic sustenance. It becomes the doing away with an activity that is of personal economic benefit to you although it may be of little benefit to others. So there may in many instances be more agony than anything else in this reorganization process.^[10]

POWER OF COMMAND

The power of command—the power of a governor to order the actions of executive officials—is also shared with the legislature and, therefore, varies from state to state.^[11] Most state constitutions grant governors explicit or implied powers in the form of the “supreme executive power,” the power to “faithfully execute the laws,” and the power to “require information in writing from the officers of the executive department.” On the other hand, the authority to create state offices and prescribe the duties and responsibilities of state offices resides with the legislature. Precedents at state and national levels generally authorize the elected chief executive to direct the official actions of any agency head subject to the chief executive's power of appointment. In other words, the discretionary acts of an agency head are subject to command by the governor and enforced, if necessary, through the power of removal. Further, because most state statutes grant agency heads broad authority to

define state programs, specify program purposes, and implement those programs, gubernatorial command may encompass not only the individual acts of agency heads but also their discretionary authority to issue rules and regulations. Gubernatorial orders may take the form of verbal instructions, executive orders, proclamations, reorganization orders, memoranda, and various other policy directives. The legislature may seek to limit the scope of gubernatorial command by prescribing an agency head's duties with more specificity or by removing an agency head from appointment by the governor or through statutory mechanisms providing for legislative oversight of executive rule making.

Gubernatorial commands may generate political liabilities, for example, in issuing directives that narrow program purposes and exclude potential beneficiaries. Directing personnel on a day-to-day basis may be unproductive. According to former governor Pryor of Arkansas, a governor “will spend almost as much time keeping his staff and his cabinet and the people around him happy as he does keeping his constituency happy.”^[3] Governors are also thrust into resolving battles among and between staff and agency personnel that ultimately result in deflated egos. Directing an agency to do something it is reluctant to do may lead to bureaucratic foot dragging and attempts to emasculate the directive. Or, directing an agency to turn down a federal grant may generate interest group pressure to reverse the governor's decision. Another approach to the power of command is to delegate, but delegation too has political impact. A governor who delegates may be viewed as a weak manager by agency personnel and by the public but ultimately will be held politically accountable for problems that occur under delegation.

In sum, the role of governor as chief administrator is conducted in the political arena, and the exercise of administrative power requires an investment of political capital. Although administrative action frequently has more impact than legislative action, governors have come to recognize the political costs of investing time and resources in the administrative role. Says former governor Walker of Illinois: “Nobody cares ... whether you're actually managing state government ... It's not a political plus ... In terms of getting votes or a better image or a better reputation, you'd better spend your time somewhere else.”^[3] Another assessment similarly concludes:

... the substantive success of the Governor's efforts at management improvement could not be translated into votes, for there was little, if any, real political support for effective management. Unlike almost any other area of state policy, there was no major constituency to whom management improvement was a salient

issue. Indeed the situation was quite the contrary, as most organized interest groups pushed for objectives which militated against good management.^[10]

EMERGING TRENDS IN GUBERNATORIAL ADMINISTRATION

At the start of the twenty-first century, new directions in gubernatorial administration are emerging—shaped in part by progressive-era ideals evident from the start of the twentieth century and in part by political realities experienced throughout the past century. Governors today have wider latitude than ever before in determining the character of their governorship and specifically in performing the role of chief administrator of state government. Emerging trends suggest that governors may determine their governorship and administrative role around three distinct patterns, discussed below.^b

First, *a governorship should be balanced in its attention to policy and administration.* In the modern governorship, a governor should attend to two primary and roughly equivalent roles, which are as chief administrator and chief policy maker in state government. As chief administrator, a governor is held politically accountable for the administration of state government and advances those long-standing progressive-era ideals that give order and value to management in state government. Effective gubernatorial management should be conducted through sophisticated delegation to essential components of gubernatorial administration, specifically, gubernatorial staff, executive budget staff, and cabinet officers. A governor should reinforce the core values and distinctive contribution expected of these administrative components. Gubernatorial staff should assure focus on the governor's policy priorities. Executive budget staff should enforce the governor's fiscal policy priorities. Cabinet officers should manage major state functions and represent the administration to the primary constituencies of state government.

Second, *a governorship should focus on policy and political strategy.* In the modern governorship, a governor should focus on policy and political strategy essential to achieving gubernatorial policy priorities. The governor should practice “hands-off” management, and management of state government should be a secondary concern of the governorship. Gubernatorial appointees should be oriented foremost

to gubernatorial policy, and administrative actions should be assessed in terms of their contribution to the policy agenda and political resources of the governor. State bureaucracies are expected to implement public policies.

Third, *an entrepreneurial governorship should commit to reinventing state government through competition and individual choice.* In the modern governorship, a governor should exercise entrepreneurial leadership to reinvent government, take risks in stimulating the economy, and advance free market competition and individual choice. The governor's attention should be focused on steering the state; the rowing functions of state government should be delegated, decentralized, diffused, or privatized. Competition should be injected into the delivery of state services, and those delivering services should be held accountable to their customers. State bureaucracies should be required to compete for service delivery with private and non-profit organizations. Wherever possible, public-private partnerships should be encouraged, and authority for state services should be diffused and decentralized.

Gramm–Rudman–Hollings: Impact on the Federal Budgetary Process

G.L.A. Harris

*Mark O. Hatfield School of Government, Portland State University,
Portland, Oregon, U.S.A.*

INTRODUCTION

Our nation's federal budget deficit looms large at almost \$8.5 trillion, enough to hold each and every American accountable for at least \$27,494 of that debt.^[1] And, given the size of today's federal deficit, in 1985 and 1987 it was this very premise under which the Gramm–Rudman–Hollings (GRH) Act was enacted in a desperate attempt to keep the federal government's deficit, and in turn the national debt, from spiraling out of control.

Today's deficit woes would suggest, that although admirable in principle, the goals of GRH have not been realized. But, according to former Senators Phil Gramm (R-Texas) and Warren Rudman (R-New Hampshire), two of the three sponsors of the Act and for whom the Act was partly named, "Those who call the 1985 Gramm–Rudman–Hollings balanced budget law a bad law because deficit targets have been missed and accounting gimmicks have been used to avoid tough decisions would probably also suggest that religion is a failure because there are a few saints in the world."^[2]

At a time of partisan rancor and an ever increasing federal budget deficit, GRH appeared to represent the best of few alternatives to get the nation's fiscal house in order. The purpose of this article is to describe what prompted the passing of the GRH Act; why the courts got involved on constitutional grounds; the pros and cons of enacting this legislation; and given the significance of the Act, the numerous attempts to revisit the seemingly intractable problem of the federal budget deficit.

TOWARD BUDGET ENFORCEMENT UNDER GRH I

The Balanced Budget and Emergency Deficit Control Act of 1985, known as the GRH I Act (P.L. 99-177), was passed on December 11, 1985 largely due to a political impasse that ensued between President Reagan and the Congress over how to best attack the troubling federal budget deficit.^[3] Accordingly, the Act signaled that 1) the Congressional Budget and Impoundment Act of 1974 failed to address an

increasing federal deficit,^[4] 2) the impasse between the President and the Congress demanded a "statutory framework" to compel resolution (on page 267 of Ref.^[4]), and 3) the intent by Congress was to seize control of budgetary authority from the executive branch.

Although like his predecessor Jimmy Carter, President Reagan's pledge was to achieve a balanced budget, his strategy for doing so was different.^[5] Reagan intended on achieving a balanced budget in accordance with his own commitment to three policy objectives; first, to continue to accelerate the defense buildup; second, to reduce taxes; and third, to force a retrenchment of domestic programs.^[6] Against a Republican Senate and a Democratically controlled House of Representatives that were both concerned about the deficit but diverged markedly on how to reduce it, a compromise in the form of GRH was struck as no lawmaker dared to be seen as being against a balanced budget.

GRH changed the federal budgetary process by mandating the following. First, the Act established specific targets for deficit reduction in \$36 billion increments per year until the budget was balanced or at zero deficit by fiscal year 1991.^[7-9] Second, the Act introduced across the board cuts known as sequestration that would occur in certain categories of outlays (spending). Federal programs such as Social Security, for instance, were rendered exempt from sequestration and half of such cuts would come from certain entitlement programs and some federal retirement programs while the remaining half of the cuts would affect discretionary programs such as defense procurement.^[10] The intent of GRH was that the very threat of sequestration, due to failure to meet targeted budget deficit levels, would force the President and Congress to strike an agreement.^[7]

Finally, specific procedures established spending and revenue limits at the beginning of the budgetary process.^[11] Such constraints were designed to invoke discipline in the budgetary process.^[7] This would in turn neutralize political conflicts, increase the likelihood of adherence to the budgetary process, and expand accountability requiring sequestration reports.^[7,9] Further, GRH provided an incentive for Congress to detail appropriations thus limiting the

discretion of the executive branch over appropriation allocations.^[12] GRH amended its precursor, the Congressional Budget and Impoundment Act of 1974 and instituted procedures that made it difficult for the President and Congress to pass annual budgets that would increase the deficit.

THE ROLE OF THE GENERAL ACCOUNTING OFFICE (GAO) UNDER GRH I

Agreement to GRH was often a very contentious process but clearly marked a period that propelled lawmakers to action given a rising deficit by the 1980s (at 3% of GNP with outlays at 20% of the GNP), an approaching election, vocal concerns by constituents, and the need to break the impasse between the President and the Congress.^[6] The sentiments of Senator Warren Rudman (R-NH), a cosponsor of the Act, reflected the mood of the period when he said that GRH is “a bad idea whose time has come” [on page 237 of Ref.^[5]; on page 85 of Ref.^[10] (as cited by Kowalcky and LeLoup^[13] on page 24)].

But, despite the agreement, GRH signaled the mistrust that existed between the various factions. To achieve neutrality, particularly given the threat of sequestration while ensuring that the threat was not so overwhelming as to undermine the process, GRH called for protection of the deficit but within the President’s budget through the Office of Management and Budget (OMB) and the Congressional Budget Office (CBO).^[6,12] Further, Congress trusted the CBO for its objectivity and reputation as a nonpartisan entity.^[6] However, questions surfaced as to the constitutionality of the CBO giving the President a directive to make certain cuts in the federal budget. To overcome this hurdle, it was thought that the General Accounting Office (GAO), under the Comptroller General, would not only provide political cover and curtail any test of the constitutionality of the Comptroller General’s role in the process but would also give credibility and impartiality to the process before sequestration could occur. GRH mandated that, should the President and Congress fail to reduce the deficit by targeted levels or “maximum deficit amounts,” the process of sequestration would be automatically triggered (on page 10 of Ref.^[6]).

The OMB and CBO would thus base their projections of the federal budget and deficit on reasonable assumptions given the direction of the economy, the impact of these conditions on the federal budget, and the rate of outlays from certain programs in accordance with the policies and/or rules applied to those programs and funding levels. Should the estimate by OMB and CBO result in a disagreement, the accepted estimate would be the average estimate of the two

agencies. The GAO, and thus the Comptroller General’s role, was simply to provide an additional safeguard for the process that triggers sequestration. A joint OMB and CBO report is submitted to the GAO for review by the Comptroller General. The Comptroller General then issues a report that is independent of both the OMB and the CBO reports.

It is thus the estimates contained in the GAO report, once submitted to the President, that triggers sequestration. While it is the Comptroller General’s report that is, in essence, the last say before sequestration, the report must fully explain any discrepancies that exist between his own report and that of the joint OMB and CBO report. GRH intentionally detailed this budget information in terms of where budget cuts are to be made. This, in turn, reduced the discretion of the President to question and/or reallocate cuts.^[6] Additionally, as a fallback, should any of the procedures be rendered unconstitutional, the joint report by the OMB and CBO was to be submitted to the Temporary Joint Committee on Deficit Reduction, not the Comptroller General.^[10] The Temporary Joint Committee on Deficit Reduction was a body comprised of the budget committees from both houses of Congress that would issue a joint resolution. Within 5 days of the receipt of the joint report to both houses, Congress would be required to “certify” sequestration under special rules to vote on the resolution (on page 96 of Ref.^[10]). If the resolution is passed and then signed by the President, this formed the basis for sequestration.

WHY DID THE COURTS GET INVOLVED?

But GRH proved to be one of the most controversial and often misunderstood pieces of legislation. Despite the sponsors’ attempt to allay fears based on constitutional grounds by inserting the GAO and thus the Comptroller General’s review to signify the objectivity of the process and one that would appeal to all parties involved, the Act itself triggered legal action on the very constitutional role of the Comptroller General.

Barely hours following the signing of the legislation, two lawsuits, combined as *Bowsher vs. Synar*, alleging that GRH should be declared unconstitutional,^[14] was argued and heard before a special three judge district court panel^[10] for the following reasons. First, GRH violated delegation of authority where power is vested in the Congress not to delegate this authority.^[6,10] Second, if delegation of authority is constitutional, that delegation to the Comptroller General violated the separation of powers doctrine. And, third, that GRH prevented unionized employees from receiving timely cost of living increases.^[14]

The District Court ruled that the plaintiff had standing to challenge certain provisions of GRH and that broad deficit reduction power to the Comptroller General was unconstitutional. The *Bowsher vs. Synar* decision was automatically appealed under an expedited review to the Supreme Court.^[10] In a 7–2 decision, the Court concluded that sequestration under GRH was unconstitutional and, in writing for the majority on the separation of powers doctrine, Chief Justice Burger wrote:

Congress cannot reserve for itself the power of removal of an officer charged with the execution of the laws except by impeachment. To permit the execution of laws to be vested in an officer answerable only to Congress would in practical terms reserve in Congress control over the execution of laws . . . The structure of the Constitution does not permit Congress to execute the laws; it follows that Congress cannot grant to an officer under its control what it does not possess.

—as cited by *LeLoup et al.*^[10] on page 97 in
Bowsher v. Synar, 1986.

REVISITING FISCAL RESPONSIBILITY UNDER GRH II

Since sequestration under the separation of powers doctrine was invalidated by the Supreme Court, the sponsors of GRH quickly exercised the Act's "fallback procedure" of using the combined OMB and CBO report instead of the GAO report submitted to Congress (on page 22 of Ref.^[6]). Here, the Temporary Joint Committee on Deficit Reduction considered the report. Under joint resolution and expedited procedures, and based upon the contents of the report, the joint resolution goes to the floor of the Congress for a vote. If the contents of the report are agreed to and signed by Congress and the President, the President is obligated to the reductions in the federal budget as per the report. The sponsors of GRH still ensured that the GAO played a role in determining the deficit estimates.^[10] However, it was OMB in conjunction with the CBO estimates that would issue the final report to the President not the GAO as the original version of the Act called for.^[10]

This fallback version of the original GRH legislation, which also encountered stiff opposition in the House and by the President, in a 63–36 vote by the Senate, was enacted and came to be known as the Balanced Budget and Emergency Deficit Control Reaffirmation Act of 1987 (P.L. 100-119) or GRH II.^[10] While this version of the law attempted to address the constitutional flaws of GRH I, it nevertheless bogged down the process because neither the House nor the Senate leaders could agree on how to resolve the constitutional flaws. Further, members

were preparing for the August 15 recess and Congress opted to a temporary extension without deciding on the 1987 amendment.

However, the OMB and CBO estimates predicted what many lawmakers had feared; that the federal deficits for both fiscal years 1986 and 1987 were larger than expected. The CBO and OMB estimates for fiscal years 1986 and 1987 were \$170.6 billion and \$156.2 billion, respectively. However, without the GAO estimate to reconcile this amount, the average deficit was taken at \$163.4 billion. Had the original procedures under GRH I taken place, the deficit requirement before sequestration would have been \$144 billion.

Under GRH II, while lawmakers avoided the across the board cuts, deadlines for enacting the fiscal year 1987 budget were missed. Many referred to the myriad of tactics employed by lawmakers as "golden gimmicks" and "smoke and mirrors" (on page 99 of Ref.^[10]). Congress agreed to a deficit of \$151 billion, below that of the target under GRH II. Further, attempts by the sponsors of GRH to prevent the government from using its borrowing authority unless the procedures under GRH II were complied with, were unsuccessful. Should sequestration be activated, half of the cuts would have come from defense, while the other half would have affected domestic spending. Entitlement programs such as Social Security and Medicaid, for example, were exempt. The Act was signed into law on September 29, 1987.

REAL OR PERCEIVED: THE IMPACT OF GRH ON THE FEDERAL DEFICIT

The Gramm–Rudman–Hollings Acts of 1985 and 1987 (GRH I and II) represented the most far reaching legislative attempt to overhaul the legal and administrative framework of the federal budget since the 1921 Budget and Accounting Act. However, GRH proved to be controversial in many ways, most notably, challenging the separation of powers doctrine, where the role of the Comptroller General in determining the point at which automatic across the board budget cuts or sequestration, would take place. But assessing GRH's impact on the federal budget deficit really depended on whom and to which side of the aisle you belong.

Proponents of GRH believed that, given the sign of the times, the enactment of GRH, or at least legislation similar to it, was inevitable. First, GRH attempted to take the politics out of the budgetary process by levying legal and institutional constraints against increasing the federal deficit.^[12] The Act's goal was to achieve neutrality in the budgetary process. Further, the political climate was such that many believed GRH would provide the political will through sequestration to hold down federal spending.^[7] In fact, some

also believed that GRH would provide the political cover to reduce the deficit by exploring other unpopular alternatives such as increasing taxes and decreasing entitlement programs. And, the threat of sequestration, it was hoped by the sponsors, would serve to force lawmakers to reduce the federal deficit.

Second, GRH may have provided the mechanism to put the brakes on government spending.^[7] In essence, without GRH II, the federal deficit might have been much larger. Some programs, including those for defense, stopped increasing after the 1980s, while in the 5 fiscal years following the passage of GRH II, some programs were actually reduced. Even some domestic programs, such as Medicare, were restrained under GRH II. Accordingly, “the limits imposed by GRH II may have stiffened the fiscal backbone of the political system” (on page 228 of Ref.^[7]).

Third, GRH has had far reaching effects beyond that of the size of the federal deficit and how such reductions would be achieved.^[7] GRH II has impacted how political power is balanced and how legislative priorities are determined. It has resulted in a change in the positions of some programs and committees. Some tax writing committees, for instance, have gained and lost importance. Tax committees have gained by having both spending programs and revenues under their purview. These tax committees, under the Ways and Means and Finance Committees, may have provisions that raise revenues while overseeing entitlement programs that reduce spending. But these committees have also lost under GRH II (i.e., drug initiatives or disaster relief) because decisions on certain tax legislations were out of their hands.

Fourth, GRH II has helped to reposition the priorities of some programs in securing increasing resources for some (i.e., Medicaid) while helping to scale back already weak programs that leave them more vulnerable to budget reductions (i.e., telephone tax extensions).^[7] Fifth, GRH II has changed the legislative process for the budget by requiring that the deficit cannot exceed a prescribed target.^[12] Congress and the President must work together to achieve agreed upon levels of expenditures and revenues toward deficit reduction to avoid sequestration.

Next, GRH II encouraged uniformity in the budget process through the use of coherent and consistent methods and baseline estimates toward each proposed budget.^[12] This was an attempt to eliminate “manipulation of budget authority/outlay ratios” although it was conceivable that program outlays would be increased as a cushion should sequestration take place (on page 638 of Ref.^[12]). This uniformity also applied in the sense that, should sequestration occur, every budget account would be reduced in a uniform manner. Under sequestration, GRH II actually gave the President latitude on where the cuts in defense

should occur as long as he notified the Congress of those changes.^[15]

GRH also built the estimation of technical and economical factors into the budgetary process to ward off unrealistic assumptions.^[15] The definition of baseline estimates was expanded on where budget cuts would occur by allowing consideration of inflation and increased program participation. GRH II strengthened the enforcement procedures of the budget by prohibiting, for instance, the Senate’s consideration of irrelevant information and those items that may serve to increase outlays in the future. Such prohibitions made it more difficult for waivers to be granted by requiring a 60 vote majority. Finally, GRH II called for further reforms of the budgetary process by inserting a pilot program of certain federal agencies of their biennial appropriations.^[15]

Despite the laudatory reviews about GRH, there is no shortage of reasons as to why the legislation was considered a failure by many.

First, under GRH II, the fact that the deficit targets and timetables by which these targets were to be achieved were relaxed, point to what opponents refer to as “gimmicks in the law” (on page 8 of Ref.^[16]). Many such gimmicks, some believed, came in the forms of overly optimistic economic predictions and manipulating pay dates. Some critics went as far as dubbing GRH II “an ineffective and dangerous piece of legislation” (on page 191 of Ref.^[3]).

GRH II established that the President, in concert with Congress, estimates “in his judgment” what the outlays and appropriations for the budget should be to run the federal government (on page 694 of Ref.^[4]). This signaled personal responsibility of the President for the nation’s fiscal soundness. By dictating prescribed budget targets in anticipation of the deficit, this undermined the President as well as his responsibility for the budget. Congress cannot dictate to the President.^[4] In essence, “An executive budget expresses what the President wants” (on page 698 of Ref.^[4]). The President’s budget is only a proposal, therefore, Congress has no right to tell him what to do. And as such, GRH II makes it easy for the President to shirk his responsibility for the federal budget.

Third, GRH II did not control the federal deficit; it created the illusion that it would.^[3] The first term of the Reagan administration marked a period of increasing defense spending and tax cuts. Although during this period of GRH II the deficit did not grow as much, it was still clear that the deficit had not been controlled.

Fourth, the short-term orientation of GRH II made it inappropriate for long-term budget problems.^[4] This 1-year focus promoted gimmicks such as shifting the costs of some programs from one year to another. Doing so forced appropriation bill projections to be unnecessarily delayed for the most recent budget

projections. Such delays made it more likely that, when critical decisions were to be made, the necessary give and take process would be averted because the members of Congress for such debates would be absent as such decisions would likely result in “budget summits” (on page 698 of Ref.^[4]).

Many also believe that budget delays and thus budget projections were held over to deliberately conceal the size of the budget deficit.^[4] And, the budget, and in turn the deficit, were even more skewed because GRH II emphasized expenditures (outlays), not revenues. Accordingly, this is tantamount to “deceit” as a way of concealing the actual size of the deficit (on page 698 of Ref.^[4]).

Sixth, some saw GRH II as a “crutch” that both the President and the Congress used to avoid making difficult decisions about problems in the federal budget (on page 698 of Ref.^[4]). Complying with deficit targets did not address the situation at hand as this enabled the President and Congress from confronting the real federal budget problems. Further, there was less public pressure on the President and Congress to reduce the federal deficit in the belief that GRH II would take care of the problem.

Some contend that GRH II was poorly designed.^[3] While the threat of sequestration was forced to achieve a compromise, many members of Congress found the President’s proposal for budget cuts to be more palatable since 70% of budget outlays (entitlement programs) were exempt from sequestration. The remaining 30% of the budget, or those programs subject to sequestration (discretionary programs), did not induce the same political fallout. As a result, fiscal years 1986 through 1989 saw the deficit targets and timetables relaxed thus avoiding sequestration and realistic deficit control.

GRH II prevented the normal consensus building between political parties and deliberations on tax increases and outlay cuts to take place.^[3] It favored sequestration of outlays while failing to meet the revenue side of the budget. GRH reduced the incentives for the parties to compromise while encouraging illusory budgetary tactics to circumvent sequestration. GRH II, according to Alice Rivlin, “risks destabilizing the economy” (on page 196 of Ref.^[3]). Rivlin believed that constraints imposed by GRH II in setting specific budgetary targets may have served to weaken an economy that should be stimulated.

Uniformity of cuts under sequestration failed to consider those programs that should be expanded and those that should be reduced.^[3] Sequestration appeared to consistently impact the same 30% of programs while insulating the same remaining 70%. And, the basis for such cuts often reflected the politically charged interest of various groups.

Under GRH II, there was an overreliance on deficit estimates by the OMB.^[3] Since the OMB represented

the President, it tended to insert the partisan interests of the executive branch and unduly influenced the legislative process.

Finally, GRH II encouraged overestimation of the budget revenue and thus an underestimation of the actual size of the federal deficit.^[3] This resulted in gaming the system to avoid sequestration, not control the budget by reducing less than is needed to curb the deficit while forcing bigger cuts in the federal budget in future years.

CONCLUSION

The events leading up to the 1985 and 1987 GRH Acts were contentious. It signaled a period ripe for change. Known in its original form as the Balanced Budget and Emergency Deficit Control (GRH I) Act (1985) and its revised version as the Budget and Emergency Deficit Control Reaffirmation (GRH II) Act (1987), GRH represented the best of few alternatives given an exploding federal budget deficit. Besides, at the time, voting against a balanced budget was not what lawmakers wanted as their legacy. It was an impasse that resulted in this key legislation.

GRH overhauled the federal budgetary process by establishing three primary goals. First, the Act created specific targets and timetables by which the federal deficit should be annually reduced. Second, that failure to achieve prescribed deficit levels within required timeframes would automatically result in sequestration. This feature was inherently designed to force the President and Congress to forge an agreement to reduce the deficit. Finally, the legislative and administrative framework established by the Act demanded a disciplined approach to the federal budgetary process. This, the sponsors hoped, would help to neutralize partisan politics.

Reaction to and the impact of the GRH legislation have been mixed. Failure of GRH to bring about a fundamental change in the federal budgetary process and reduce the deficit is not surprising to those critics who see such reforms as mere regurgitations of previous ones. According to Joyce,^[17] budget reforms, as history has proven, is likely to produce much less than is promised or more of the same because there are those who keep looking for a “silver bullet” to this largely intractable problem (on page 36 of Ref.^[17]). Yet, there are others like Havens^[6] who believe that reducing the federal deficit becomes a “political imperative” as long as the solutions are broached in a “balanced” and “fair” manner (on page 23 of Ref.^[6]). Perhaps it was this political imperative that moved the Clinton Administration to not only balance the federal budget but also leave the succeeding Bush Administration with a record \$500 billion surplus. It is conceivable

then that GRH, for all of its shortcomings, might have provided the traction to impose fiscal discipline after all. But, as Senators Gramm and Rudman stated, “Just as we don’t judge the success of religion by the number of saints but by whether or not the world is better off, so should we judge Gramm–Rudman–Hollings”.^[2]

We now then face tension from the pessimism stemming from our past failures at federal budget reform vs. the imperative for reform to achieve fiscal soundness. On one hand, the abject failure of GRH shows the intractability of the problem. A strong Act, created cooperatively with the President and bipartisan Congressional support, could not hold back the political forces leading to fiscal disaster. Yet on the other hand, the growing voices of discontent like the current movement led by former Comptroller General, David Walker, warning of the impending fiscal ruin, point to the importance of trying again for fiscal reform to attain fiscal soundness.

Grievance Procedures and Administration

Lisa B. Bingham

INTRODUCTION

This chapter describes the basics of the grievance procedure. It provides a discussion of several theoretical perspectives used in grievance procedure research, and reviews literature on grievance initiation, processing, decisions, and outcomes. Then, a brief discussion about grievances and organizational performance is provided. Finally, the grievance mediation, a recent innovation in the grievance procedure is examined.

THE GRIEVANCE PROCEDURE

The grievance procedure has received significant attention from scholars and practitioners as a critical component of the labor–management relationship. There are substantial variations in the scope of the grievance procedure from contract to contract and across the public and private sectors. The definition of a grievance is subject to the terms of the collective bargaining agreement or contract. In its broadest conception, a grievance is any employee complaint about an employment relationship. In a grievance procedure, a grievance is a *written* allegation by employees that management has in some way violated their contractual rights. Grievances generally allege some breach, violation, misinterpretation, or misapplication of language in the collective bargaining agreement, often with regard to wages and hours, discharge and discipline, safety and health, insurance benefits, seniority, leaves of absence, promotions, vacations, management rights, and union rights.^[1–3] Although there is variation across the private and public sectors, the basic issues brought to arbitration in the two sectors are similar. The primary difference between the public and private sectors appears to be with the prevalence of certain categories of grievances. For example, termination, suspension, or disciplinary actions resulting from drug and alcohol use, insubordination, absenteeism and tardiness, and abusive behavior are the highest incidence of cases brought to arbitration in the public sector.^[3]

Although there are significant variants, grievance procedures generally move through a series of steps before increasingly higher management authorities, beginning with informal discussion and the writing of a complaint, and ending with arbitration. The overwhelming majority of grievance procedures culminate in binding arbitration, in which an outside neutral third party issues a final decision on the grievance. The common step structure of the grievance procedure is described below.

Informal Step

The first step of any grievance requires the expression of a complaint. The employee, sometimes with the assistance of the union steward, discusses the complaint with the immediate, first-line supervisor. Most contracts encourage this informal step, because it is generally preferable to resolve all disputes as early or as quickly as possible, because parties' positions tend to harden once a grievance becomes formal and written. In this step, many disputing parties settle grievances during informal discussions between the employee and supervisor, and these never enter the grievance process as a formal, written complaint. Unfortunately, these informal grievances are generally not captured in traditional management information systems; therefore, researchers are limited in discovering the true nature and extent of informal grievances in the workplace.

Step One

If the employee and supervisor cannot resolve the dispute informally, then the grievance is submitted in writing, formally becomes a grievance, and technically enters the grievance procedure. Usually, there are time limits within which employees must act. Once the written grievance is filed with the first-line supervisor, a formal written decision must be issued, again within negotiated time limits. If the employee or union is dissatisfied with the step one response, they may appeal the grievance to step two.

Step Two

At step two, the grievance is generally presented to officials higher in the organization. In the public sector, it might move from the immediate supervisor to a department head, or from a school principal to the superintendent of schools. In the private sector, it might move from the immediate supervisor to a plant manager, or to some other designated representatives who are familiar with the contract and with grievance precedent. The officials hear the complaint and render a written decision. The employee or union can still appeal the decision; however, they must usually file the appeal within a stricter and shorter time frame.

Step Three

If a complaint reaches step three of the grievance process, then it likely has precedent-setting ramifications, major cost implications, or broad application within the firm's operation.^[4] As such, participants with more authority are brought into the discussion. In the public sector, the grievance might reach a board of police commissioners, school board, city council, personnel board, or other elected multimember public agency. In the private sector, it would reach upper management. Again, the responding official renders a written decision within a limited time frame. This is often the step at which parties call in legal counsel or regional union representatives. The union usually has the sole prerogative to determine which grievances will move beyond this step to arbitration and has an internal union grievance committee for making these decisions.

Step Four

The final step in the grievance procedure is usually arbitration, in which a neutral third party hears both sides of the case and renders a written decision to the appropriate management and union officials. This written decision is usually final and binding, although traditionally, the arbitrator is not bound by precedent. Witness testimonies and documents can be presented as arbitration evidence, and the party initiating the grievance (usually the employee or union) typically has the burden of proof.

THEORETICAL PERSPECTIVES ON GRIEVANCE PROCEDURES

There are several theoretical perspectives used in the scholarly study of grievance procedures. Researchers using *systems theory* examine the connections between several variables and the different stages of grievance

procedures, emphasizing a correlation between labor relations and the filing, processing, and settlement and postsettlement outcomes of grievances.^[5–10] *Human resource management* theorists suggest that human resource practices that encourage worker participation in work teams, problem solving, and other high-involvement activities can improve grievance procedures and have a positive affect on organizational performance. *Procedural-Distributive Justice* theorists, applying a research framework first used in courtroom settings, argue that organizational decisions will be more readily accepted if the processes by which they are achieved are perceived to be fair.^[11,12] Research supports the suggestion that perceptions of the fairness of grievance procedures significantly influence employee perceptions and attitudes toward those grievance procedures.^[13,14]

Research based on Hirschman's^[15] *exit-voice-loyalty theory* suggests that the grievance procedure is a "voice" mechanism that allows employees to air complaints and issues to management. The theory holds that when provided a "voice" option, employees will be less likely to "exit," or quit the organization. Accordingly, some theorists suggest that employees who file grievances will be less likely to leave their employers than those employees who do not file grievances.^[16–18] However, empirical evidence for this theory is mixed. In contrast, other scholars using *organizational punishment-industrial discipline theory* suggest that those involved in grievance activities are significantly more likely to be the subjects of negative post-grievance outcomes, such as retaliation. Empirical support for these propositions is garnered by the fact that "fear of reprisal" is the most frequently cited reason for not using available grievance procedures.^[19,20]

DETERMINANTS OF GRIEVANCE INITIATION

There has been extensive research on the determinants of grievance filing. Some researchers have found significant *demographic* differences between grievance filers and non-filers. For example, researchers have found that grievants tend to be younger and less educated and that minorities tend to file more grievances than Caucasians.^[5,21] Similarly, researchers have found that grievance filers are typically younger, with more skilled jobs, higher rates of absenteeism, dispensary visits, and insurance claim filings than non-grievants.^[22] Finally, others have found that grievance filers have significantly lower job satisfaction, more negative attitudes toward their supervisors, greater perceived pay inequity, stronger preferences for worker participation in decision making, and lower satisfaction with their unions than non-grievants.^[23]

Some researchers have examined the relationship between *management factors* and grievance initiation. Research demonstrates that managerial strictness with regard to performance and disciplinary actions is significantly related to grievance filing rates,^[24] as is managerial monitoring of employees.^[25] *Union factors* also appear to have an impact on grievance filings. Research shows that the grievance behavior of union stewards is related to company commitment, union commitment, and job satisfaction,^[26] and the activity and involvement of union officials in grievance procedures can affect grievance filing rates.^[5,24,27] Just as union officials may have an impact on the filing of grievances, so too do grievance filings affect union officials. For example, more favorable grievance outcomes are associated with larger, more supportive constituencies for union stewards,^[28] and grievance handling has a significant effect on the probability of being reelected as a union steward, as well as on the percentage of votes obtained in that reelection.^[29] Finally, the degree of perceived conflict in the *collective bargaining relationship* is significantly related to grievance filing rates.^[28,30] If union-management relations are hostile or confrontational, then grievance procedures may be used more frequently, possibly to increase pressure on management during times of contract negotiation; conversely, a cooperative union-management relationship may have a constructive and productive impact on grievance activity.^[31,32] In short, evidence indicates that grievance filing rates are likely to decline given cooperative union-management relationships.

GRIEVANCE PROCESSING, SETTLEMENT, DECISIONS, AND OUTCOMES

Research regarding grievance processing addresses the efficiency of the grievance procedure in resolving disputes quickly and with finality. As such, an important measure of grievance procedure effectiveness has been the rate of grievance resolution in the steps before arbitration or the intervention of some other third-party neutral. Early settlement of grievances is preferable, because grievances tend to become more difficult to settle once they are written and proceed through higher levels of the grievance process. Factors such as early authorization from upper management and union officials to resolve a grievance, and the written presentation of a grievance as opposed to simply an informal discussion, have been correlated with the earlier settlement of grievances.^[33]

Typically, an arbitrated case can have one of three settlements: 1) the grieving party can win the case; 2) the grieving party can lose the case; or 3) the arbitration can result in a compromise.^[3,26,34] In terms of

the settlements decisions, research demonstrates that the longer a grievance is under consideration at any level of the process, the more likely management is to respond favorably.^[29] Moreover, some assert that employees can typically expect a favorable grievance settlement, because parties involved in a workplace dispute must usually continue their relationship after the dispute is resolved.^[32,35] Research comparing public- and private-sector grievance outcomes confirms the following: 1) public-sector employees tend to “win” grievance cases more frequently than their private-sector counterparts; 2) there tend to be fewer discharge cases in the private sector than in the public sector; 3) more suspension and reprimand cases reach arbitration in the private sector than in the public sector; and 4) of grievance cases that resulted in suspension, fewer public-sector cases resulted in long suspensions.^[36]

Even though employees can usually expect a favorable settlement, important research using the organizational punishment-industrial discipline theory of grievances suggests that grievants can also face significant unfavorable postsettlement outcomes. For example, in the postgrievance settlement period, grievants tend to have lower performance ratings, promotion rates, and work attendance rates, as well as higher turnover rates.^[5] In addition, research has also shown that grievance filers *and* the supervisors against whom the grievances were filed, have significantly higher turnover rates and significantly lower job performance ratings and promotion rates in the immediate postgrievance settlement period than employees who did not file grievances and their supervisors.^[21] In short, evidence suggests that employees and supervisors involved in grievance activities face the potential of more workplace retribution than employees and supervisors who are not involved in grievance activity.

GRIEVANCE PROCEDURES AND ORGANIZATIONAL PERFORMANCE

Historically, one impetus for the development of grievance procedures was to help reduce strikes and work stoppages; yet, there are few studies that systematically compare the strike activities of employees with grievance procedures to those without grievance procedures. A study of the coal-mining industry, an industry with historically high strike rates, suggests that strikes were more frequent in those mines where supervisors were perceived as being unable to effectively handle grievances or where disputes could not be resolved locally.^[37]

More commonly, research in this area links grievance filing rates to various measures of organizational performance. There is evidence that access to grievance

procedures contributes to lower quit rates, which likely helps lower turnover and retraining costs,^[17,38] and that employee turnover rates are lower among unionized firms with access to grievance procedures.^[39] Other research has shown that high levels of grievance activity are associated with reduced levels of productivity.^[39-43] One possible explanation for these findings is that an effective grievance system can help organizations detect current or potential problems and rectify issues and undesirable situations before they develop into larger, more systemic problems.

INNOVATIONS IN GRIEVANCE PROCEDURES: GRIEVANCE MEDIATION

While employment dispute resolution and arbitration are addressed in other chapters in more detail, there are also innovations under way in the collectively bargained grievance procedure. The most notable innovation is the use of grievance mediation. Grievance mediation is an alternative to arbitration and is typically included as an additional step prior to arbitration. In grievance mediation, a third-party neutral assists the union and management parties in negotiating a mutually agreeable and voluntary settlement to the grievance.^[44,45] Whereas arbitration is generally seen by unions and employers to be expensive, time-consuming, and overly legalistic,^[46] mediation has been shown to have greater cost-effectiveness and result in swifter settlements, while simultaneously ensuring the satisfaction of participants.^[32,47,48] Moreover, whereas arbitration is intrinsically adversarial, mediation has more of a cooperative nature that allows greater opportunity for problem solving and collaborative initiatives. Research has generally shown grievance mediation to be an effective alternative to arbitration, resolving more than 80% of mediated grievances, and an efficient alternative to arbitration, resolving grievances more quickly and cheaply.^[32,35,49]

CONCLUSION

This chapter provided an overview of the collectively bargained grievance procedure, its structure, a brief review of theories about its function, major themes in the empirical research about that function, and an introduction to grievance mediation as a recent innovation. The grievance procedure is an essential component of the collective bargaining relationship, one that makes the benefits of industrial democracy accessible to the individual employee. It provides employees with a meaningful avenue to exercise voice with regard to workplace concerns. Researchers have learned much about what factors contribute to grievance initiation,

how procedures can process grievances most efficiently and effectively, and what grievance procedures produce in terms of decisions and outcomes. However, there is still need for considerably more research, particularly on the systemic impact of grievance procedures on organizational performance.

Groups and Their Properties

Claus Langfred

John M. Olin School of Business, Washington University, St. Louis, Missouri, U.S.A.

INTRODUCTION

Groups are an inherent part of human social organization and have relatively recently been heavily incorporated into modern organizations in the form of work groups and teams. Groups have many important features that affect their performance and dynamics, and while they are prized for the performance benefits they have compared to the same number of individuals, they can also be a source of inefficiency, conflict, and errors.

As a general rule, effective groups require three things. First, the group must have the knowledge, skills, and abilities (KSAs) necessary to perform the task. Not every member of a group needs to have all of the KSAs for the group to succeed, but the group collectively must have them. Second, motivation and willingness to expend effort toward the group's goal is necessary. If group members are not interested in performing the task, it matters little whether they are able to or not. The converse is also true: no matter how motivated or enthusiastic members of a group are, the group will not succeed without the necessary KSAs. Third is the communication and coordination necessary to carry out the task. Many groups fail in this third category and often do not understand why. These are the three minimum requirements for groups to be effective and successful.

DEFINITION AND TYPES OF GROUPS

A work group (or team) is a collection of individuals who see themselves, and are seen by others, as a social entity and who are embedded in one or more larger social systems. They are interdependent (to some degree) in their tasks and often manage relationships with people external to the group. While most agree with the basic definition by Hackman,^[1] some researchers feel that "team" connotes more than "group," describing a group with relatively more commitment and cohesion, in addition to a greater task focus.

Teams can be subdivided into various categories and typologies, such as parallel, project, cross-functional, management, and others. While such distinctions separate them on the basis of task, it is not clear that they distinguish groups from teams. As a general rule, the terms group and team can be used

interchangeably with little loss of meaning. This article focuses on the small group or team, typically ranging in size from as little as three or four people up to as many as 20 people.

POPULARITY AND PREVALENCE OF GROUPS

The use of work teams has rapidly grown in the United States, with an estimated half of all employees currently working in team situations. Work groups and teams have become critical to organizational effectiveness, and their use has become pervasive in modern organizations. The use of teams and groups ranges from the production floor to the executive suite and covers activities from heart surgery to fire fighting and from dog food manufacturing to space exploration. Teams are used by social service agencies, in the military, and in hospitals, and in schools and universities. It is difficult to identify a field of human endeavor in which groups and teams have not become commonplace. Even in a relatively specialized and individual field like academia, we find groups represented in permanent and temporary committees, departments, and for administrative tasks.

With the increased adoption of groups and teams by a wide range of firms and organizations, and as the use of groups and teams in organizations continues to increase, researchers and practitioners focused their attention on understanding the dynamics, design, and effectiveness of teams. As the use of teams has increased, so has the variety of different team designs. The use of self-managing, empowered, or autonomous groups and teams has increased dramatically in recent decades. Of Fortune 1000 firms, about two-thirds use self-managed work teams, and practically all use employee participation groups of some sort.

CHARACTERISTICS OF GROUPS

Group size is one of the most obvious of group characteristics, and it affects groups in many ways. The ideal group size is between four and eight people. When a group becomes too large, it is more difficult to effectively coordinate the behavior of group members, and the group starts to divide into smaller subgroups

and cliques. Larger groups are more susceptible to various motivational problems, such as free riding and social loafing. If a group is too small, on the other hand, many benefits of groups can be lost, and conflict and polarization are more likely.

The structure of a group can vary widely and refers to the way a group is organized and how various positions in the group relate to one another. Well-established groups will have a much more developed and rigid structure than newly formed groups. Characteristics like roles, status, norms, cohesion, and interdependence are part of a group's structure.

Diversity refers to the variation among group members on a variety of dimensions, such as background, education, nationality, ethnicity, age, gender, etc. If the task of the group involves decision making, problem solving, or creative tasks, diversity allows the group to perform better and with greater accuracy and quality. However, if the group's task is highly interdependent and requires considerable coordination, then diversity can interfere with its ability to perform effectively. While a group with little diversity, and hence few differences, can coordinate and communicate effectively, it cannot be as effective at problem solving and decision making. The benefits or costs of diversity are thus dependent on the task and other characteristics of the group.

Roles are the expected behaviors associated with a given position within a group. Members of a group will generally occupy different social roles. Some roles are formal and may be externally imposed, while others are less formal and may emerge over time. Group members may hold multiple roles, and roles may even be switched or interchanged within a group. Different social roles are usually associated with different degrees of status, which affect group dynamics insofar as members with higher status may have more influence or may be less susceptible to group norms or pressure.

Group norms are the general rules and expectations for appropriate behavior that are accepted by the group. Norms can be explicit, or they can be implicit and emerge over time. Norms generally develop quickly and often have a strong influence on member behavior. Groups are effective at enforcing behavior to conform to the norms in the group, particularly in cohesive groups. The more cohesive a group, the better it is at enforcing conformity to group norms.

Cohesion is the extent to which group members feel a part of the group and wish to remain in the group. Generally, the more cohesive a group, the more loyal and committed group members are to the group. Cohesion can be good or bad, in that high cohesion in a group means it is good at enforcing norms, regardless of what those norms are. If the group is interested in and motivated toward high performance, this is desirable, but it is quite detrimental if the group

is motivated toward other goals, interfering with high performance. Effective teams generally are characterized by high cohesion combined with performance-oriented norms.

Interdependence is the degree to which coordination between individuals in the group is necessary for successful task attainment. Depending on the nature of the task, interdependence can be described as pooled, reciprocal, or sequential.^[2] The interdependence in a group dictates the extent to which coordination and communication are required in the group and is one of the defining and most crucial characteristics of a group. A highly interdependent group with high coordination requirements clearly is different from a group in which close coordination among group members is not necessary for group goals to be realized.

While leadership has long been known to exert a strong influence on group effectiveness, few general conclusions can be drawn about leadership. Depending on organizational contexts—such as the immediate task environment, resources, time pressures, interdependence, diversity, personalities and attitudes of group members, and other factors—different leadership styles may be appropriate to the situation. Under some conditions, an empowering and inclusive leadership style may yield the best results, whereas under other conditions, a directive and dictatorial leadership style may be most effective.

Autonomy has received a lot of attention in recent years, as the prevalence of self-managing teams, autonomous work groups, and empowered teams has increased dramatically. Granting autonomy to groups can lead to better group performance, because groups and group members are closer to the task and, thus, are able to make more accurate task-related decisions than a more “distant” supervisor. However, the increased coordination and communication required for group decision resulting from increased autonomy can also lead to process losses, so while the potential of autonomy is great, the implementation of it is difficult. Autonomy also raises the issue of striking a balance between the amount of autonomy that individual group members have and the amount of autonomy the group as a whole has—another difficult management decision.

Finally, an important characteristic of a group is the stage of its life cycle. Groups, like people, often have a specific life span. They are created at some point, they go through a period of learning and maturation, and they become mature groups. While some groups replenish themselves indefinitely through member turnover, others may end. Where a group is in its life cycle also has implications for dynamics and performance. Young groups are busy developing norms and communication systems and will not be able to perform as well as mature groups. A mature group, on the other hand, might be stable and cohesive but may suffer

from problems of conformity, polarization, and other biases in decision making and problem solving.

BENEFITS OF GROUPS

Some of the benefits of groups are obvious, as a group of people can accomplish things that the same number of individuals cannot. Given effective coordination, groups achieve many feats that are completely outside the scope of the same number of individuals. Groups with high degrees of task interdependence particularly demonstrate this, such as a military assault team or a surgical team involved in a complicated heart procedure.

As groups make decision or solve problems, they are generally more accurate than the average group member and often as accurate as even the best group member. The group decision is much more than just a simple aggregation of individual decisions, involving active discussion and evaluation of ideas, viewpoints, and alternatives. This process of information sharing and interaction, and even conflict and disagreement, generates better decisions.

Often, disagreements lead to novel solutions or alternative viewpoints that increase the quality of decisions. Having a dissenting minority opinion in a group has been found to cause more complex and rich discussion of issues. In this sense, limited conflict in a group contributes to a higher quality of decisions. By the same logic, the amount of diversity in the group also leads to more creative outcomes, which can be further facilitated by a wide variety of existing group decision-making techniques.

Groups, through such characteristics and cohesion and strong norms, can also increase commitment and motivation to a task, such that a group may expend a lot more effort and energy on a task than the same number of individuals. In military organizations, morale and esprit de corps is deliberately encouraged and reinforced so that units will be more motivated and will not give up on difficult tasks, where otherwise, individuals might lose motivation. This is one of the greatest strengths of groups, the social identification that can be generated, and is a method by which members of a group may be much more motivated toward a goal than a comparable number of individuals.

A more “hard-wired” variation of this motivational effect that membership in a group may have on individual members is the phenomenon of social facilitation. Social facilitation is the effect that the “mere presence” of others has on performance.^[3] When other people are present, individuals tend to perform better or work harder. The theory is more complex, and disagreement exists as to the mechanisms and details of the phenomenon, but it is indisputable that the

presence of other group members affects the effort level of an individual.

Another aspect of the strong social interactions that can improve group and team performance over that of the same number of individuals is trust. Along with strong cohesion and norms, highly effective teams are characterized by high levels of trust within the team and toward the team leader or supervisor. In the context of a team, particularly a highly interdependent team, trust is much more likely to develop than in an independent group of individuals.

Thus, a stable and cohesive team consisting of relatively interdependent people, who share performance-oriented norms and trust one another, and who possess the KSAs, motivation, and communication skills to accomplish their goal, will be far more effective than the same number of individuals working toward the same goal. In some cases, the individuals will not be able to accomplish the goal, and in others they will simply perform at a much lower level.

POTENTIAL HAZARDS OF GROUPS

While a variety of benefits to groups are outlined above, there are also aspects of group dynamics that can hurt performance. It is important to note that in the balance, the benefits of groups far outweigh the hazards (hence, the widespread use in modern organizations), but some hazards exist and can lead to poor performance and dysfunction. Understanding and recognizing these limitations is therefore important in order to avoid them. Some benefits of groups, like strong group identity and competition, can become potential problems if not managed, and these are discussed as well.

One of these potential limitations is process loss. Because groups need to coordinate the activities of members (depending on the amount of task interdependence in the group), inefficient coordination and communications can harm performance. In the extreme case, performance can be extremely poor, and process loss can outweigh any benefits of the group, as group members spend too much time trying to communicate and coordinate rather than working.

Groups can also suffer motivation losses, among individual group members or the group as a whole. Social loafing is a phenomenon where individuals decrease their effort level as the size of the group increases.^[4] The effect is strongest when tasks are simple and additive or when individual effort is not easily identifiable but can be minimized when individual effort is accurately identifiable or when tasks are sufficiently involving.

Another motivational problem that occurs is free riding, which occurs when a member of a group exerts less effort and lets others in the group do more of the

work. Free riding is somewhat more deliberate than social loafing and occurs when people perceive their efforts to be dispensable. In other words, if an individual believes that the group will succeed regardless of his efforts, he will be less likely to work hard. In general, groups with high task interdependence are less susceptible to extensive free riding, as are groups in which individual effort is more easily identifiable.

Free riding and social loafing can lead to other motivation losses, namely, those based on equity theory. If other group members perceive that some in the group are free riding off their efforts, they tend to lessen their effort level to reduce the perceived inequity of “carrying” the free rider. This loss of motivation has been called the “sucker effect”^[5] and is a conscious and deliberate behavior. It is important to note that much as it appears that free riding can lead to a downward performance spiral, it is unlikely in cohesive groups with strong performance norms. It is more likely in groups of a temporary nature or in groups in which norms and trust have not fully developed.

Conformity effects are powerful in groups.^[6] In general, people tend to conform to the group (even when they know it is wrong) when they face a unanimous group, the judgment is difficult, they value or admire the group, their deviation is easily identifiable, or they are scared. On the other hand, people conform to the group less when they have great confidence in their expertise on the issue, they have high status in the group, they are strongly committed to their initial view, or they do not like or respect the group. This is generally a good thing, in that conformity allows groups to be unified and decisive in their action, but it has a potential downside in that creativity can be stifled, and group decision making can be superficial or even erroneous.

Such pressure to conform or not to express a different view is the central component of the groupthink phenomenon,^[7] in which valuable information is ignored or not even raised during discussion. The best examples of groupthink are in foreign policy, such as the Bay of Pigs invasion, Argentina’s decision to invade the Falkland islands, or the escalation of the Vietnam War under Lyndon Johnson, suggesting that a crisis atmosphere contributes to the problem.

Groups can also become more polarized in opinions or behavior than the individual group members were originally. This effect occurs when group members share an underlying agreement. When this is the case, group discussion often leads to group consensus around a more extreme viewpoint than the one originally held by the group members. Group polarization is sometimes also discussed as *risky shift* in groups, in which group discussion leads to riskier decisions than individual group members’ decisions. Again, like conformity, this can be a good thing as well as a bad thing, depending on circumstances.

The risk of disagreement and conflict is, of course, a risk in any social group. While a solitary individual working on a task has no potential for conflict, groups, by definition, run the risk of conflict. Even though some disagreement and dissent contributes to better and more complex decisions, too much disagreement can obviously lead to conflict that interferes with the coordination and stability in the group, and ultimately harms performance. While a potential threat, a stable group with members that possess good communication skills is relatively immune to such destructive levels of conflict.

Groups that exist in an environment with other groups, which is the case in most organizations, also suffer from a number of perceptions and behaviors that appear to be ingrained in humans. One of these effects is in-group favoritism and out-group discrimination. Group members tend to favor their own group and discriminate against other groups, in terms of allocating resources or rewards. This effect, called the minimal group paradigm, can even be triggered by creating groups based on insignificant and arbitrary differences^[8] and is, thus, quite powerful when applied to existing groups that differ on significant and salient dimensions. Individuals perceive members of their own group to be more varied and individually distinct (in-group heterogeneity) and perceive members of other groups as being more similar to one another and having less variation (out-group homogeneity). It is worth noting that this is again only a *potential* hazard. Having groups with a strong identity and commitment to the group over other groups is generally a positive trait that will contribute to cohesiveness and trust.

Groups can also become quite competitive and aggressive toward one another, leading to intergroup conflict, especially when competing for scarce resources or when incompatible goals exist.^[9] Many groups in large organizations will be competing with other groups for resources, rewards, and other forms of recognition, and conflict can intensify effects such as perceptions of out-group homogeneity. When managed, this is a great source of motivation and energy for groups, and group identification combined with competitiveness can spur greater performance. Some of the greatest team performance is created in the context of intense competition with other teams. Very beneficial to organizations, this only becomes a potential problem if it is allowed to spin out of control and become destructive and non-performance oriented.

CONCLUSION

Groups are a pervasive and inescapable aspect of life in modern organizations, and understanding and managing them is crucial to overall organizational performance. While groups can easily outperform the same

number of independent individuals, it is important to be aware of potential limitations, related to process and coordination, as well as to motivational and social psychological effects, that can interfere with the considerable benefits of groups and teams.

Health Care Decision Analysis, Alternatives in

Krishna S. Dhir

Campbell School of Business, Berry College, Mount Berry, Georgia, U.S.A.

INTRODUCTION

Health care professionals routinely face complex decisions. There are a number of factors that contribute to increasing complexity in practically all aspects of health care professions. Research knowledge is growing rapidly. Technological sophistication is increasing. Health care organizations have become more complex. Laws are not simple. The challenge of decision making in the health care industry is becoming more and more daunting. Adding further complexity to health care decision-making process is the fact that physicians are no longer the sole arbitrators of patients health care provided to the patients. The process has become democratized, and even politicized, with the entry of other parties, such as health insurers, regulators, politicians, lawyers, ethicists, family members, and indeed, patients, in the decision-making arena. These parties are not necessarily adequately trained to tackle the problems that confront them. They may not understand the dynamics involved in regard to the various factors to be taken into account. Often the relationship between actions taken and desired outcomes is uncertain. All options available to the decision maker may be poorly specified or understood. Therefore, unassisted, decision makers may make poor decisions. In this article we review some of the theories and frameworks available for the analysis of decisions, which could assist the decision-making process. However, before we explore the alternatives available to decision makers, we further explore the nature of clinical decision making.

THE NATURE OF CLINICAL DECISION MAKING

Subjectivity plays an important role in practically every aspect of medical practice, including the tasks of diagnosing, assessing, and treating. Although clinical as well as laboratory techniques continue to become increasingly sophisticated and precise, the integration of the information obtained by health care professional remains a subjective process. Clinical judgment has its limitations. To make a decision based on judgment, the health care professional processes social information. This information is obtained from

the environment and could come from a variety of sources. The decision maker must integrate this information. The cognitive image provides a representation of the environment based on the professional's past training and experiences, essentially predisposing the person to interpret, integrate, and respond to the information in predictable ways. This adds to the complexity of the interaction between the clinician and the patient. Each may bring very different sets of beliefs, values, experiences, and perspectives to the decision. Additionally, the information may be imperfect or incomplete. The outcome may be uncertain. The value placed by the patient on the outcome may not be clear. In light of all these considerations, clinical judgments are probabilistic. The process of clinical judgment is fundamentally a covert process. Individuals seldom describe their judgment process accurately. Ordinarily, the only means of explaining judgments are introspection and guessing at reasons. These explanations are generally incomplete and misleading. Subjective reporting is fallible. Judgments are thus inaccurately reported and are observed to be inconsistent. Identical circumstances do not always lead to identical judgments. Observations of inconsistencies may send an observer looking for hidden motives or incompetence on the part of the decision maker.^[1] Robust evidence from randomized controlled clinical trials often does not support clinical decisions by health care professionals. Therefore, many clinical decisions have to be made on the basis of limited evidence, even when robust information is absent.^[2,3] Additional considerations impact the decision-making process of health care professionals. The pressure on them to take account of both costs and effectiveness of alternative treatment strategies is mounting. Technological and pharmacological innovations have generated a range of treatment options where hitherto options were limited. For instance, kidney inefficiencies may be treated either by drugs, or dialysis, or through transplant. Hypertension may be treated with beta-blockers or diuretics. Patient may prefer increased quality of life to longevity, or vice versa.

Fortunately, a number of theories and frameworks are available that offer considerable promise to health care professionals. Approaches based on these frameworks deal with the difficulties described above by

formalizing the manner in which the health care decision problems are structured, and making explicit the manner in which they are then analyzed. If the parameters of one's judgmental policy orientations could be identified, then we might model the process of that person's judgment and develop support systems to aid clinical judgment. This process may be explored by posing the following questions:

1. What is being judged? This refers to the clinical or medical criteria being assessed.
2. What factors influence the individual's judgments? Answers will identify variables that influence the professional's assessment of the criteria. These factors should have mutually exclusive characteristics or properties.
3. What relative emphasis or weight does the individual put on each of these factors? This question refers to the relative weights assigned to the factors the professional takes into account in making the clinical assessment. One source of disagreement between health care decision makers arises from the fact that different weights are likely to be attached by different decision makers to the factors.
4. How does the health care professional integrate the information regarding each factor to arrive at an overall judgment? Identification of the mathematical relationship, which describes the dependence of the overall judgment on the factors considered, is important. The relationship between each factor and the overall judgment may be linear or non-linear, and the contribution of each factor to the overall judgment may be positive or negative. The nature of dependence of the overall judgment on each factor is referred to as that factor's function-form.
5. How consistent is the health professional in making judgments? An individual may make different judgments about the same situation on different occasions. At least two characteristics of the judgment task are known to affect consistency: task complexity and task uncertainty. Studies show that consistency is lower when the judgment task is complex and when the task requires the use of non-linear rather than linear function forms. Even when a decision maker intends to use a specific judgment rule as defined by a specific set of factors, relative weights and function forms, his or her judgments or assessments may deviate from those suggested by that rule. In the absence of explicit and immediate feedback on judgment, the decision maker may be unaware of the degree to which the actual judgment or assessment deviates from that intended.

Consistency is different from accuracy. A decision maker can be accurate but inconsistent, consistent but inaccurate, both consistent and accurate, or neither. Consistency has to do with the reliability of the decision maker in executing the intended judgmental policy as defined by a specific set of factors, relative weights and function forms. When deviation between the actual judgment and that intended is low, consistency is greater. On the other hand, accuracy has to do with the validity of the policy itself—whether the judgmental policy executed (the specific set of factors, relative weights and function forms) is indeed the one that was to be executed.

ALTERNATIVE APPROACHES

Among the various theories and frameworks for analysis of the decision-making process available to the health care professionals are the following: Decision Theory and Multiattribute Utility Theory,^[4] Behavioral Decision Theory,^[5] Analytic Hierarchy Process,^[6] Prospect Theory,^[7] Social Judgment Theory,^[1,8,9] Information Integration Theory,^[10] Attribution Theory,^[11] Conflict Theory,^[12,13] Constraint Theory,^[14] Bazerman's bargaining and negotiation framework,^[15] and Fuzzy Decision Theory.^[16] While Decision Theory evaluates unidimensional utility functions over single attributes, Multiattribute Utility Theory seeks to maximize the overall utility derived from a set of criteria or attributes. They both are prescriptive in nature. Both these theories assume rational behavior. Decision making is reduced to knowing the various alternatives available to the health professional for choice, the probability of the respective alternatives occurring, and the worth or value of the outcomes of the respective alternatives to the decision maker. The decision is made by mathematically discounting the expected value to be realized from each alternative by the probability of realizing them. The probability may be objectively known through historical or empirical observations, or be subjectively estimated.^[4] Behavioral Decision Theory is based on the subjective expected utility concept, and like Decision Theory and Multiattribute Utility Theory, attempts to prescribe rational decisions. It attempts to explain the less-than-optimal behavior of decision makers in psychological terms.^[5] Analytic Hierarchy Process provides a unique mathematical approach for the analysis of multiattribute decision making that does not require the direct assessment of utilities or probabilities as demanded by decision theory and behavioral decision theory approaches. It describes a decision problem in terms of linked hierarchical layers of considerations. Paired comparisons among factors considered are made with respect to a consideration of

the next highest level of hierarchy to yield a final set of ranking among the various options.^[6] Prospect Theory, which is sometimes also referred to as the psychological decision theory, moves beyond description of decision-making process to explanation and prediction of decision behavior. It attempts to explain why decision makers deviate from rational prescriptions. It argues that decision makers psychologically transform probabilities of outcomes into decision weights or emphasis, and value of outcomes into psychological or perceived worth, before indicating their preference or making their choice. It seeks the cognitive sources of departure from the criteria of rationality and attempts to make decision makers aware of their own errors and biases.^[7] Social Judgment Theory, which evolved from the work of Brunswik,^[9] explores interpersonal conflict arising from different judgments and lends itself to applications in policy analysis. The “social” element in social judgment theory is derived from the interaction it affords among two or more parties through improved communication.^[1,8] Information Integration Theory combines a psychological theory of measurement with a theory of information integration to produce a coherent expression of the subjective nature of human judgment. It seeks to discover the metric form of the cognitive algebra employed in cognitive activities, e.g., is the information integrated in one situation by one algebraic principle, and in another situation by another algebraic situation?^[10] Attribution Theory draws from Gestalt psychology, and focuses on one’s explanation of one’s own behavior and the behavior of others. It views people as observing events in their environment and seeking causes of events by evaluating available information. It does not seek models of individual judgment or decision.^[11] Conflict Theory relates to the group decision-making theory of groupthink. It provides a descriptive theoretical perspective on how people handle decisional conflicts where potential outcomes are of some consequence to the ones making the decision. It accounts for the effect of psychological stress on group decision-making behavior.^[12,13] The more comprehensive Constraint Theory seeks to explain how cognitive (time, knowledge, ability, personality, attitudes, etc.), affiliative (need for recognition, acceptance, conformity, obedience, etc.) and egocentric (personal motives, prestige, stress, self-esteem, and other emotional needs, etc.) constraints influence the decision-making process, often resulting in suboptimal outcomes.^[14] Bazerman’s adaptation of Prospect Theory to bargaining and negotiation is also of interest, especially in view of increased democratization of the decision-making process in the health care industry. He extends the application of the Prospect Theory to situations where multiple parties jointly make decisions to resolve conflicting interests.^[15] Fuzzy Decision Theory assumes

that human judgment and decision making is based on a complex system whose elements were fuzzy, yielding imprecise, even vague, measures of information. It deals with possibility and believability (e.g., can the event happen) instead of probability (e.g., will the event happen).^[16] Cooksey,^[8] on pages 26–54, offers detailed discussions of these theories, and also of some others not discussed here, in the context of their applicability to the analysis of judgment and decision.

CHOOSING A FRAMEWORK

Health care professionals encounter a variety of decision-making scenarios. When confronting problems that require coherence, they would likely prefer to project their clinical judgment competence in terms of logical, mathematical, or statistical rationality. In such cases, they are likely to benefit from analytical frameworks that are primarily mathematical or econometric in approach, such as those offered through Decision Theory, Multiattribute Utility Theory, and Analytic Hierarchy Process, with their emphasis on prescription of how rational decisions should be made; Behavioral Decision Theory and Prospect Theory, which explore *why* decision makers depart from rational prescriptions; and Bazerman’s approach on bargaining and negotiation that is philosophically based on rational prescription. The objective in the health care profession, however, is not always to prescribe an approach to clinical health care professional. When confronting problems that demand clinical judgment, the health care professional may benefit more from an *explicit description* of his or her own judgment process rather than a *prescription* of what the judgment process ought to be. In such situations, frameworks offered through Social Judgment Theory, Information Integration Theory, Conflict Theory, and Constraint Theory may be of particular benefit. Social Judgment Theory is particularly useful where the objective is to obtain a model of individual judgment process, which may then be used to develop judgment and decision aids. Attribution Theory does not do this. Attribution Theory generally assumes that the person making the judgment does not influence the cognitive processes underlying causal judgments. The Information Integration Theory has generally stayed away from applications. The framework offered by the Social Judgment Theory is also easy to use. The methodology involved yields relatively straightforward and mathematically clean results that are easily understood by decision makers. Further, literature reports that the simple additive models of decision making based on regression analysis seem to be at least as accurate as the more complex models and are preferred by many users with respect to most criteria of desirability.^[1]

CONCLUSION

In this article we explore the complex nature of clinical decision making. We identified the various factors that contribute to the complexity of the clinical decision-making process. Information is usually incomplete. Clinical decision-making process is becoming increasingly democratized. The various decision makers bring their own beliefs and values to the decision problem at hand and are predisposed to interpret, integrate, and respond to information in predictable ways. The judgment process itself is fallible and covert. Self-reporting of judgmental policies is inaccurate. However, it is possible to describe a decision maker's judgmental policies underlying the decision-making process in terms a set of parameters. These are identified.

Various theories and frameworks available to the health care decision maker to analyze the decision-making process are discussed. Some of these facilitate logical, mathematical, or economic rationality. These tend to be prescriptive, offering what rational decisions might be taken, or explaining why the decision taken may differ from rationality. Others facilitate a description of the decision-making process as it is, avoiding a prescription. Yet others facilitate analysis of the decision-making process when the information available is imprecise and vague, and the decision maker also brings to the decision-making process his or her own perceptions of possibilities or believability. Suggestions are offered as to how the health care professional might choose an approach to analyze the decision-making process from among the alternatives available.

Health Care Decision-Making Behavior, Emerging Paradigms of

Krishna S. Dhir

Campbell School of Business, Berry College, Mount Berry, Georgia, U.S.A.

INTRODUCTION

In this article we examine some of the decision-making processes found in the health care industry. We review a set of paradigms to assist the understanding of emerging health care decision-making behaviors. The concept of paradigms should be differentiated from the concept of models. A model is an empirical, sometimes idealistic representation of a particular process in the real world. However, a paradigm embodies a distinctive and more or less coherent set of general ideas and principles, whether intellectual, ideological, ethical, or otherwise, which serve to make sense of and provide guidance for the understanding of the process.

Decision-making processes in the health care industry are becoming increasingly complex. In this day and age of exciting medical developments, it is easy to conjure up images of patients going to hospitals routinely for replacement of various parts of their anatomy, no matter how critical their function. However, new medical technologies are complicating clinical practice. The emergence of technologies that make heart, liver and other organ grafts, transplants and prosthetic replacements feasible demands reconsideration of definitions of life and death. Difficult decisions, many with consequences not well understood or not previously encountered, have to be made. As we come to grip with these, new paradigms are evolving to assist in the understanding of corresponding behaviors. Some of the emerging paradigms of health care decision-making behavior are discussed below. Specifically, we present a discussion of ethical, courageous, and virtuous decision-making behaviors.

ETHICAL DECISION-MAKING BEHAVIOR

An ethical dilemma is characterized by a requirement of 1) a choice to be made between equally desirable or equally unsatisfactory alternatives; 2) an assignment of different or competing priorities and responsibilities to alternatives; or 3) solving a problem that has no satisfactory solution.^[1] The dilemma may emanate from the decision maker's system of values, principles, or sense of duty, and may be exacerbated by uncertainties

of outcome or consequences resulting from the choice, assignment, or solution.

In the health care industry, the Hippocratic Oath is among the earliest representation of an ethical decision-making behavior paradigm. Nevertheless, some writers have observed that in America medical ethics may not be getting the attention it needs,^[2] and several medical schools have abandoned the practice of new students taking the Hippocratic Oath. Others see reason for hope in the transition from the personal ethics of oaths to the communal professional ethics of codes, and applaud the "revolutionary" transition from personally interpreted "gentlemanly" ethics sworn to by individual practitioners to collaboratively interpreted professional ethics.^[3] Through past few decades, the interest in the teaching of *ethical* decision-making behavior in the professions has been growing. Epstein has offered a sweeping review of the development of professional ethics and corporate social policy.^[4]

Practically every aspect of medical practice involves ethical considerations. These include issues pertaining to balancing between morbidity and mortality, the development of treatment methods, cultural contexts, obtaining informed consent, and whistleblowing. Today, health care decision makers are forced to cope with unprecedented legal, socio-political, economic and other issues, such as having to decide who gets an expensive treatment and who does not; and whose treatment gets funded by the grants for experimental treatment and who must pay from his or her own resources. They must determine whether societal resources of sizeable amounts are better spent on development of a mechanical heart or on a prophylactic public health program.

New technologies take physicians, insurers, regulators, politicians, ethicists, family members, patients, and indeed the entire society, through uncharted territory. Not all consequences of new technologies are known. Bates highlights the ethical issues of consent to surgical treatment, linking the issue with law, conditions that render the consent invalid, and implications of poor handling of the consent process.^[5] Weijer points to the need for placebo-controlled trials for novel surgical intervention.^[6] However, what should serve as the

placebo control remains controversial. Furthermore, while blinding is a desirable feature of a randomized controlled trial, it is not indispensable. Efforts to preserve blinding become unduly burdensome on patients, as in the case of trials comparing chemotherapy and radiation therapy for cancer treatment. Typically, placebo drug trials are viewed as a therapeutic intervention. In surgery trials, could sham surgery be viewed in the same way? This poses an interesting challenge for ethical analysis of risk.

Medical science is based on a strong scientific bias that demands clinical trials to mirror laboratory experiments in which variables are manipulated one at a time to facilitate attribution of effects to cause. In reality, clinical care and human response to disease are simply too complex. While the physicians' decisions are based on the state-of-the-art knowledge of medicine, it is also by necessity based on assumptions of the cause-effect relationships between biological factors, and between intervention and consequences. What further complicates matters is that physicians are no longer the sole arbitrators of health care provided to the patients. Other parties, such as health insurers, regulators, politicians, lawyers, ethicists, family members, and indeed patients, have a say in the matter. These parties have now entered the arena that was once the sole concern of physicians. Democratization of the decision-making process has added to the complexity of the emerging paradigms of ethical decision-making behavior in the health care industry. For instance, most adult Americans continue to favor the right to euthanasia and physician-assisted suicide, while lawyers, politicians, and ethicists continue to have difficulty in dealing with their implications. To deal with ethical issues emerging from innovation in medicine and surgery, health care decision makers are increasingly referring to what Agich calls the regulatory ethics paradigm.^[7] The paradigm holds that deviations from standard care involves experimentation requiring the application of a set of procedures designed to assure the protection of the rights and welfare of the subjects of research. This paradigm regards innovative treatment as a departure from standard or accepted treatment, irrespective of whether the accepted treatment is effective or a burden. Innovative treatments are regarded as suspect and questionable until they are framed in a research protocol with prerequisite informed consent mechanisms. The paradigm requires that to be ethically defensible: 1) a research protocol must be prescribed to test the innovative treatment, based on scientific research methods; 2) formal mechanisms of informed consent must be implemented; and 3) professionally competent review board must review the prescribed protocol. Unfortunately, in practice "the complex processes characteristic of clinical innovation are often not reducible to

a scientific protocol... The demand that a clinical trial be undertaken in a field of medicine undergoing rapid and dynamic development can actually thwart innovation."^[7] The recent revision of the *Declaration of Helsinki* recognizes that with informed consent of the patient, the physician should be free to apply unproven or new preventative, diagnostic or therapeutic strategies where proven methods are non-existent or ineffective, if in the physician's judgment these strategies offer hope of saving life, alleviating suffering, or restoring health.^[7]

COURAGEOUS DECISION-MAKING BEHAVIOR

Ethical decision-making behavior may or may not demand courage. Similarly, courageous decisions may have little to do with ethics. Generally, courageous behavior is "characterized by efforts to be productive, make contributions, and help others and results in a sense of personal integrity and thriving."^[8] It is recognized as a complex phenomenon that is promoted and sustained by various interpersonal and intrapersonal factors. In the health care industry, courageous decision-making behavior has received little empirical scrutiny although anecdotal accounts of courageous behavior by patients exist.^[9] Psychologists such as Deutsch and Kohut have reflected on its nature.^[9,10] Deutsch pointed to the need for the use of actual social situations, especially ones of conflict and crisis, as a kind of laboratory for the study of social process.^[11] He concluded that courage is manifested when the inner conviction (regarding the situation relevant to the courageous act) exceeds the perceived punishment potential; it is not manifested when the reverse holds true. He also differentiated between non-conformity, independence, and courage. Philosophers such as Rorty^[12] and Walton,^[13] and theologians such as Tillich,^[10] too, have speculated about the nature of courage.^[8] Unfortunately, little attention has been given to the role of courage in the behavior of health care professionals as they innovate, discover, and practice their professions. In recent decades, however, attempts have been made to understand courageous behavior among patients with long-term health concerns.

Finfgeld conducted a meta-interpretative study of courage among individuals with long-term illness based on two extant works in psychology, and four in nursing.^[8] A meta-interpretative study is one in which findings from a number of qualitative works are synthesized to yield a deeper interpretation of the phenomenon of interest. The goal of such a study is to enrich the theoretical basis of a concept. This study offers a paradigm for courageous decision-making behavior in the health care industry. Finfgeld's meta-study included studies of courage in: 1) a middle-aged

woman with terminal cancer; 2) hospitalized adolescents with a variety of long-term health concerns; 3) sexual assault victims, individuals with severe physical disabilities, and people who had contracted human immunodeficiency virus or had acquired immunodeficiency syndrome; 4) chronically ill elderly; 5) young adults; and 6) middle-aged adults.^[8]

Through the meta-study, Finfgeld found that the ability to be courageous develops over time and requires efforts to fully accept reality, solve problems based on this discernment of reality, and push beyond ongoing struggles.^[8] Becoming courageous involves a lifelong learning process. The learning process begins in youth and continues through efforts of coping with persistent threats to well being. Being courageous is preceded by perceived threat such as uncertainty, loss, personal limitation, and powerlessness, helplessness, lack of control, pain, and embarrassment. The ability to be courageous is acquired through an ongoing bi-directional progressive-regressive process in which disappointments and frustrations can hinder or reverse the evolution of courageous behavior. Throughout its ongoing emergence and manifestation, courage lies on a continuum of behaviors, with non-courageous behavior at one end, courageous behavior at the other end, and different degrees of coping between the two ends. Courageous individuals take responsibility and are productive, and push themselves beyond coping.

The meta-study revealed that struggling to fully accept and comprehend a threatening situation is an essential component of being courageous. Comprehensive acceptance and understanding are enhanced by active acquisition of information, and helping others with similar problems. With full awareness, issues of well being, such as threats, struggles, and even death, are reframed and perceived to be manageable challenges. As a result of living their lives courageously, individuals experience an altered self-perception; enhanced sense of personal integrity, self satisfaction, and pride; and a sense that life has been lived well. Health care providers facilitate this process by demonstrating competence and communicating effectively. Outcomes of being courageous include personal integrity and thriving in the midst of normality. Thriving includes a feeling of power; vitality, zest; and joy and involvement in life.

Finfgeld's meta-study concluded that courage is not limitless, and the process of becoming and being courageous is dependent on intrapersonal and interpersonal factors.^[8] Cuff suggests that courage is based on a motivating purpose or mission in life.^[14] Finfgeld indicates that values promote and sustain courage by rendering powerful goals and expectations. Individuals strive to be fearless, avoid cowardice, help others, and live up to personal expectations. Hope is another factor that helps to instill courage. Patients hope that their

conditions will not deteriorate, if not improve. They also hope that if conditions do worsen, they would experience peaceful death. Individuals with ability to be courageous demonstrate a positive attitude, going beyond the norm to help others and contribute to the society. Behavior not demonstrated by them include persistent anger and pessimism, hopelessness, relinquishing of responsibility for self-care, risk avoidance, ignoring the welfare of others, and substance abuse.^[8]

VIRTUOUS DECISION-MAKING BEHAVIOR

In the evolving literature on ethical decision making one can discern emergent interest in *virtuous* decision-making behavior.^[15,16] Virtuous behavior is demonstrated by the courage to act toward protecting human welfare even with incomplete information about the potentially significant cost to the decision maker. Ethical behavior need not necessarily be virtuous or courageous. It may very well be motivated by self-interest. Unethical behavior can also demand courage. However, virtuous behavior is both ethical and courageous. Various models suggested for the study of ethics are predominantly rule-based or rule-directed. Students are presented with a narrative case and warned of the presence of an ethical dilemma. In practice, however, decision makers do not usually enjoy the benefit of being forewarned. They identify problems, formulate solutions, and implement plans, while performing under varying degrees of stress, engaging in parallel sets of concomitant activities, and interacting with a number of people over a range of decisions, all within a time constraint. Normative models of ethical decision making seek absolute truths about a decision. Positive models seek to explain actual decision-making behavior. Unfortunately, these models prove inadequate in their capacity to explain virtuous behavior.

The contemporary discussion on the ethics and moral obligation of decision making has been dominated by two major theories of principle: The deontological approach studies the decision-making behavior in terms of binding obligations, as in duty. The utilitarian approach studies decision-making behavior in terms of the importance of utility over beauty or other considerations. Unfortunately, these theories fall short of explaining behavior emanating from considerations of virtue. Other theories, such as Hobbes' non-utilitarian theory of egoism, too, are of little help in understanding virtuous decision making. However, Dhir has recently offered a new paradigm for the analysis of the virtuous decision making behavior.^[15] According to him, the process of virtuous decision making is evident when an agent attempts to ameliorate a

special class of ethical dilemma. The elements present in such decision-making process are as follows:

- Action is demanded of an agent.
- The situation is confronted unexpectedly, with little foreknowledge of the emergent situation.
- The situation is not of the agent's making.
- The situation consists of a conflict between alternative courses of action.
- At least one of the courses of action benefits the agent's self interests, satisfying the agent's individual obligations, often with relatively low associated costs or risks borne by the agent.
- Other courses of action are in interest of others, raising the issue of the individual's social responsibility, often with relatively high associated costs or risks borne by the agent primarily for the benefit of others.
- The timing may be awkward or inconvenient.
- The choice made may have significant consequences for the agent and for others.
- To be virtuous, the agent must first recognize the dilemma, that is, the agent must recognize that 1) there are conflicting obligations to be met; and 2) there is no solution that would satisfy all demands of the situation.
- Knowledge is a prerequisite for virtuous decision making. Through knowledge, the agent must seek to wisdom, or understanding, or deep insight.
- The individual must make an informed choice, with awareness of the consequences posed by the alternative actions available to the agent for all parties affected.

Consider the actions of whistleblower Jeffrey Wigand, who exposed corporate wrongdoing in spite of threats to his life and career. Dr. Wigand was Vice President of Research and Development at Brown & Williamson from 1989 to 1993. After 10 months with the company, he realized that he had a dilemma. His employers were denying that their tobacco-based products had harmful effects. He had an attractive income. He had a wife, and two daughters, of whom one required extensive medical coverage. So he looked the other way. He was not ready to face the consequences of taking an adversarial role against Brown & Williamson. Then, laboratory testing showed a controversial pipe tobacco additive, called Coumarin, to be a lung-specific carcinogen in mice and rats. In 1993, he took issue with the Brown & Williamson's continued use of Coumarin in pipe tobacco. They terminated him.

In 1994, the CEOs of seven major tobacco companies swore at congressional hearings on the effects of tobacco that nicotine was not addictive. Wigand had a confidentiality agreement with Brown & Williamson.

He decided to expose the perjury. He broke the confidentiality agreement with his former employers and appeared on *60 Minutes* with Mike Wallace in 1996. He talked about the smoking issues. He also described how his family was being harassed with death threats. Initially, CBS shelved the interview, fearing a lawsuit from his former employer. Personal fallout from the stress included a divorce from his wife that same year and financial insecurity. The interview was subsequently aired. Brown & Williamson sued Wigand for breach of confidentiality. However, with the settlement between the tobacco industry and the states, this suit was dropped in 1997.

In relation to the paradigm presented here, Wigand recognized that he had a dilemma in terms of the conflicting demands of 1) his personal well being, security of his family, and continuity of his career and 2) obligations to others, including: 1) his confidentiality agreement with Brown & Williamson to protect their secrets and 2) obligation to the society in terms of saving human lives and protecting human health. He had to make act, unexpectedly, within months of joining Brown & Williamson. The timing was awkward in that his daughter needed medical attention. Costs, both financial and otherwise, were high. Wigand made an informed choice after considerable contemplation.

CONCLUSION

In this article we have described a set of paradigms to aid the understanding of three different paradigms of decision-making behavior found in the health care industry. After differentiating between a paradigm and a model, we described paradigms of ethical, courageous, and virtuous decision-making behavior. Innovations and discoveries in health care have created ethical dilemmas never before encountered. The regulatory ethics paradigm, which has effectively guided ethical decision-making behavior of health care professionals, is now being questioned. New advances, as in the case of surgical techniques, show inadequacies of this paradigm. Greater degree of freedom for decision making by the physician is being demanded.

Courageous decision-making behavior of health care professionals has not been adequately studied. However, it has been found that becoming courageous is a lifelong process. Courageous behavior among patients with long-term health develops over time after full acceptance of reality by the patient. The patients are then able to manage their problems based on this discernment of reality, pushing themselves beyond coping to be productive and responsible.

Opportunities to manifest virtuous decision-making behavior arise when a decision maker must unexpectedly choose from alternative courses of action, of

which 1) one benefits the decision maker's self-interest, satisfying his or her individual obligations with relatively low associated cost or risks borne by the decision maker and 2) the other is in the interest of others, raising the issue of the decision maker's social responsibility, often with relatively high associated costs or risks borne by the decision maker. The decision maker must recognize the opportunity and then make an informed choice.

INTRODUCTION

In the early years of the twenty-first century, it is fair to say that changes in the financing and delivery of health care services have led to a health care delivery system far different from the fragmented delivery by independent, unconnected service units characterizing most of the twentieth century. A health delivery system or integrated network offering a continuum of prepaid managed medical care is now the norm, covering 75% of the U.S. insured population.^[1] The term “managed care” has come to refer to organized networks of service delivery providing or arranging provision of a continuum of services to a defined population.^[2] In organizational terms, a managed care system “seeks vertical integration,”^[1] a state of control by administrative decision.

The shift to widespread adoption of managed health care in the United States can be traced to 1973, when the U.S. federal government promoted competition as a method to slow health care cost inflation deriving from the launch of Medicare and Medicaid in 1967.^[3] Under the 1973 law, widely referred to as the HMO Act,^[4] federally qualified health maintenance organizations (HMOs) could require employers with more than 25 employees to offer an HMO option. This gave employers, and their employees, choices of health plans beyond the traditional indemnity insurance that had prevailed until then.

Growth of managed health plans initially was slow but gained momentum as the 1970s gave way to the 1980s and 1990s.^[5] More health plans drew members away from indemnity insurance plans using lower premiums and broader coverage as enticements. Managed health plans were able to lower member premiums by shifting from provider-set fees to negotiated contracts involving volume discounts.

At the same time, continuing escalation of health care costs led to higher numbers of uninsured or underinsured citizens, 40 million citizens on average in the mid-1990s.^[6] This number is much smaller than the 54 million people who lacked insurance coverage for at least one month (1993) and the 67 million who lacked coverage at some point during the two-year period 1992–1993.^[5]

Because the average number of citizens without insurance increased to an estimated 44 million by

1999,^[7] it is likely that the dynamic numbers have increased as well. It should be noted that underinsurance involves, to the extent permitted by law, exclusions for preexisting conditions, services not covered, absence of catastrophic coverage, insurance deductibles and copayments, gaps in medicare coverage, and lack of long-term care coverage.^[5] One particularly problematic form of underinsurance occurs for individuals who reach benefit limits while still needing care;^[8] such individuals often become dependent on government health care and income support, if the condition is debilitating.

In the early 1990s, the Clinton Administration proposed universal health care coverage through a complex system of “managed competition” to control costs.^[9,10] Though the Clinton proposal failed to become legislation, it energized the private sector into aggressive pursuit of alternatives, resulting in a pronounced shift to managed health plans.^[11]

Health care finance at the dawn of the twenty-first century can be understood in terms of decision choices of participants in the health care system and payment mechanism incentives.

PARTICIPATION DECISIONS AND FINANCING

Health plans are entities providing health care services at a fixed monthly premium for a specific period of time. Employees join health plans through their employers, who pay a fixed premium per employee for a specified benefits package for a specific period of time, usually one year. The health plan selects providers and negotiates price, volume, and payment method, which may vary depending on the type of provider. The health plan “manages” members and delivery of care using administrative tools and analytical processes. Providers include primary care physicians and specialists, inpatient and outpatient services, labs and imaging centers, pharmacies, therapists, and home health organizations.^[12] Patients are health plan members who access care through in-plan providers or, at extra personal cost, out-of-plan providers.

Employers are the dominant purchasers of health care coverage for their employees.^[6] Taxpayers, through government purchasers, finance Medicare for

the elderly and other eligible patients, Medicaid for the eligible poor, care for the Armed Forces and their dependents, eligible veterans, American Indians, children and the working poor, and other eligible populations.^[13] More recently, the 1997 federal State Children's Health Insurance Program (SCHIP) provided strong incentives to states to expand health care coverage for children in families with incomes of less than 200% of the U.S. poverty level but higher than Medicaid eligibility levels.^[14] By the end of 2001, the program provided coverage for three million children.

In transactions with health plans, employers are motivated to keep their expenditures for health care coverage low, choosing health plans offering benefits that attract and keep good employees while minimizing employer health care expenses. Some employers drop coverage for their employees if premiums increase too much.^[15] Employees participate in health care coverage costs to the degree of their contributions to premium payments and the amount of co-pays to health providers.

For example, a relatively young and healthy single employee may perceive little need for health care coverage and participate only to the degree required, effectively gambling on remaining well and accident-free. Other employees may have conditions requiring continuous or expensive medical care, or family members with such conditions. These employees know that they will use more benefits than they pay for, and are grateful that they have coverage at all.

Government purchasers, because they are purchasing for large numbers, have great leverage in negotiating prices. Indeed, the federal government prospectively sets prices as one strategy for estimating cost outlays. The ability to estimate is limited, because Medicare and Medicaid are entitlement programs for their eligible populations, meaning all who are eligible may enroll, and all who enroll are entitled to all medically indicated approved services.^[16] Thus, demand for approved services ultimately determines government expenditures for these programs in any given year.

Health plans seek profitability, that is, revenues greater than expenditures. Health plan "products" are benefit packages sold for the "monthly premiums" that employers pay and health plans use to pay providers and other operating costs. More generous benefit packages carry higher potential costs for the health plan and require higher premiums. Federal and state mandates require some types of coverage, and others are left to the health plan's discretion. Health plans calculate annual premiums using actuarial data, i.e., members' demographic characteristics and historical health care utilization data. Plan profitability depends in part on skilled forecasting of members' service utilization and in part on setting premium rates high enough to be profitable without discouraging membership in the plans.

In order to meet these goals, health plans seek control of plan members' health care utilization decisions through financial incentives, for example, co-payments and charges for out-of-network care. If the plan member seeks in-plan provider network care, one co-payment applies. Out-of-network providers carry a higher co-payment. Staff model health plans restrict access to staff providers and others only as authorized by the staff providers.^[1]

Changes in health plan membership take place annually during an open enrollment period. Employers may elect to discontinue coverage for all employees if premium costs increase too much, a choice many have exercised in recent years. Or, a large employer may move to self-funding health care costs, that is, become self-insured. Governments cannot eliminate health benefits to eligible recipients without legislative authorization. Plan members can change health plans but may not withdraw from at least minimum coverage by their employer. Health plans may elect not to offer coverage to an employer or membership categories, for example, the elderly, as some health plans have opted to do. In addition to federal regulation, many states regulate health plan choices about offering and withdrawing coverage, among other practices.^[4]

Employers and employees, governments, and health plans also can seek to limit their risks by limiting benefits offered (services covered), shifting more costs to others, or, in the case of governments, by limiting eligibility for the entitlement. Health plans also have the option, with constraints already mentioned, of limiting benefits or raising premium rates, both at the risk of encouraging employers to respond by self-insuring, searching for less costly health plans, or eliminating coverage. Employee options are limited by employer decisions about coverage. The employee may seek another employer, buy additional coverage through an outside source, or, if a spouse also has employer-sponsored coverage, elect to be covered under the spouse's plan.

MANAGED CARE FINANCIAL INCENTIVES

The financial incentives used by health plans profoundly affect the way health care services are delivered. The goal of the health plan in these transactions, as already noted, is profitability, which depends in part on the ability of the health plan to control expenditures to providers and internal operating costs. Controlling expenditures to providers requires managing utilization of care by plan members and delivery of care by providers.^[17] In their efforts to manage providers and patients, health plans employ incentives designed to reduce the amount, frequency, and intensity of services delivered by providers and used

by patients^[18] and to shift risk to members and providers.

Financial incentives vary by provider type. Capitated rates are most frequently used with primary care physicians (PCPs).^[19] PCPs are “gatekeeper” physicians who control access to the rest of the medical care system. Capitation pays per member per month fees for each enrollee registered with a provider. The capitated payment is designed to cover medical care within the practitioner’s scope of practice and often includes routine lab tests and specialist referrals. Capitated payments make provider forecasts of plan member utilization extremely important.

For care outside the PCPs scope of practice, PCPs refer to specialists under another financial mechanism that often links additional PCP revenue to number of referrals. A percentage of PCP capitation revenue may be “withheld” to create a pool of funds used to pay specialists.^[19] Alternatively, the cost of specialists may come directly out of the PCP’s capitation income.^[19]

In the first case, whatever is “saved” by minimizing the use of specialists is shared by the plan’s PCPs at the end of the contract year. Those with fewer referrals often earn the largest share of the pool. Some states regulate such revenue-sharing practices. In the second case, the PCP may make significant “profit” if many enrollees seek no care during the year, but the PCP is at risk of substantial losses if some patients have high specialty medicine costs. PCPs must carry stop-loss insurance to cover for such situations.^[20]

Some services are “carved out” of the capitation payment system, as are certain kinds of care, for example, mental health services^[19] and expensive but relatively infrequent procedures like neurosurgery and cardiac surgery.

Capitation rates base health plan expenditures and PCP revenues on number of enrollees. Health plans can forecast expenditures, and physicians can forecast their annual revenues from the plan based on the number of plan members they serve.^[20] Total physician revenues will be calculated from the number of plans accepted and the number of enrollees from each plan. Total health plan expenditures to each physician also are settled for the contract year based on members enrolled in the PCP’s practice. Members can change PCPs freely within a health plan’s provider list, and health plans manage such changes carefully, because plans do not want to pay two PCPs for the member who changes from one PCP to another. The capitated payment follows the member from the “losing” physician to the “gaining” physician.

Discounted fees and prospectively set case rates are contract payment mechanisms commonly used for hospitals and other providers. Discounted fees simply pay a set amount for the service. For example, a physical

therapist may charge \$90 for a service unit, and the health plan may pay \$60. The economic incentive for the physical therapist is to shorten the service unit time of \$60 patients. A case rate bundles services into an identifiable episode of care reimbursed at a flat fee. Medicare’s diagnostic-related groups are perhaps the most familiar type of case rate^[21] for inpatient care.

For outpatient care, Resource Based Relative Value Units are a form of case rate.^[19] Discount and case rate contracts may involve negotiations between payers and providers over the amount of the discount from charges (providers’ regular price) and assumptions used in setting case rates or global fees for specified categories of members or care episodes.

Revenues are more difficult to forecast with discounted fees and case rates, because they are based on service units rather than a fixed number of patients or episodes of care. Case rates incorporate assumptions about episode duration and procedures.^[19]

Health plan internal operations are controlled by executive decisions and management of employees. Internal operations of health plans constitute administrative costs. Health plans have marketing and sales functions, processing and paying enrollee medical care claims functions, and provider and patient relations functions. Marketing and sales functions are related to selling benefits packages to employers, medical care claims are a payment function, and provider and patient relations are new health plan management functions associated with controlling the amount of care provided.

Health plan operations management includes developing provider networks to deliver medical services to enrollees; negotiating prices with provider representatives or providers; precertifying procedures; coordinating benefits for enrollees with separate coverage; managing individual episodes of care; reviewing patient utilization, physician diagnosis and treatment patterns, and hospital lengths of stay; encouraging enrollees to undergo preventive tests; ensuring good relationships with providers and enrollees; and monitoring provider and patient satisfaction.^[22]

These activities are replicated in provider organizations to fulfill health plan reporting requirements and to generate management information for complex contract decisions.^[23] This adds administrative costs to providers’ operations. At the same time, federal and state governments add regulatory complexity, requiring physicians and hospitals to provide more and better documentation to prevent fraud and ensure quality care at reasonable cost.^[24] Additionally, increasing amounts of quality information about health plans is available to assist employers in making coverage decisions, but studies show that it is rarely used.^[25] All of these functions add administrative costs to health care service delivery in the United States, costs incorporated

into the sales, premium, expenditure cycle described herein.

In summary, the health care system at the turn of the twenty-first century is far different from that which dominated for much of the twentieth century. The health care system is rapidly becoming organized and managed by profit-making health care plans using financial incentives that spread costs and risks among the participants. At this point in time, however, it cannot be said that managed health care is less costly or more efficient. After a short period of declining inflation in health care costs, costs to all participants are on the rise again.

INTRODUCTION

The United States has experienced major changes in the way health care is delivered and coordinated, making the task of managing these organizations both complex and uncertain. Therefore, top managers need not only the traditional skills of communication, leadership, planning, and organizing, but also conflict, stakeholder, and strategic management skills. This article provides a current snapshot of the health care industry, trace its history, and note current trends in health care management. It concludes by noting the need to expand managerial competencies, as well as the vision of what health care organizations can accomplish.

A CURRENT SNAPSHOT OF THE HEALTH CARE INDUSTRY

Hospitals are no longer the dominant centers for health care delivery. Ambulatory, home health, and long-term care facilities represent significant rivals. Moreover, managed care organizations, for-profit corporations, and the government exert significant influence on the industry. Ambulatory care services have grown and expanded with advances in medical technology. These advances also are making it possible for home health agencies to provide care to more patients. At the same time, managed care and government programs have significantly reduced reimbursements, and hospitals have integrated with other care providers, creating organized delivery systems and networks. Long-term care has also been transformed, with assisted living centers having been built at a rapid pace. Fig. 1 shows the major players that influence the health service delivery sector.

Buyers

Employers, state and federal governments, and insurers are buyers of health services. Because of cost

containment pressures from buyers, health care providers have reduced staff and sought economies of scale through mergers and acquisitions.^[1] Addressing patient safety and quality expectations of buyers is a major challenge for health care providers.

Suppliers

Suppliers include the pharmaceutical, medical, and durable goods and devices that enable health care organizations to provide services. Suppliers are declining in number. Competition, rising costs, and consolidation have encouraged this trend.^[1]

Substitutes

Alternative and complementary medicine is gaining greater acceptance and use by health care consumers. Complementary and alternative medicine is defined as “diagnosis, treatment and/or prevention which complements mainstream medicine by contributing to a common whole, by satisfying a demand not met by orthodoxy or by diversifying the conceptual frameworks of medicine.”^[2] Many people have turned to alternative or complementary treatments such as acupuncture, chiropractic, and herbal remedies out of frustration with traditional medicine.

New Entrants

Long-term care facilities—in particular, assisted living centers and web-enabled home health—are just two of the emerging entrants in the health care industry. Assisted living centers provide a combination of housing, support services, and limited health care. As of 2000, more than 1 million Americans were living in assisted living residences.^[3] Assisted living, a consumer-driven sector of the health care industry, appeals to the healthiest segment of those in long-term care, with the sickest and least capable patients concentrated in nursing homes. Web-enabled home

Fig. 1 Market forces model.

health is further accentuating this trend, as telemedicine allows chronically ill patients to be monitored at a distance.

BRIEF HISTORY OF HEALTH CARE ORGANIZATION AND MANAGEMENT

Before the advent of hospitals, health care was a private matter, delivered in the patient's home. The services of private physicians, midwives, and nurses were obtained when needed and financially feasible. Chemists sold medications or "tonics." Health care has since centralized, decentralized, and is now integrated (Table 1).

Centralization of Care

Hospitals in the United States began with the almshouses and pesthouses of the 1700s.^[4] Local governments established these facilities to feed and shelter the orphaned, homeless, elderly, disabled, and chronically or mentally ill, and they provided health care as a secondary function. Hospitalization carried with it the stigma of disgrace.

During the Industrial Revolution in the United States, medical technology and training and the desire to standardize medical education all aided in the demand for and the subsequent development of hospitals. As medical technology, such as anesthesia

and the X-ray, grew so did the demand by physicians for facilities with the capabilities to practice these advanced techniques.^[4] Neither the physician's home nor the home of a patient was now equipped to diagnose and practice medicine.

Along with medical advancements came the need to standardize medical education and training. In 1910, Abraham Flexner led a study of medical education. The Flexner Report sparked systematic efforts to standardize medical education.^[4] Apprenticeships with practitioners gave way to hands-on experience in a facility with the capabilities to train students in the most advanced medical technology. Hospitals became not only places of care, but also teaching, research, and training facilities. During the early twentieth century, most administrators were physicians or clergymen who often followed the preferences of local physicians. Most hospitals centralized power at the executive level, much like a university. The competencies necessary to manage included internally focused communication, leadership, organizing, and planning skills.

World War II contributed to the development of hospitals as not-for-profit institutions. Americans began organizing care for mentally and physically wounded veterans. The number of skilled and technical workers increased in hospitals, and management's role became one of creating an environment where health care professionals could do their job, as opposed to controlling the workplace.^[5] Moreover, employers began paying for health insurance. The

Table 1 Organizational phases

Organizational phase	Period		
Centralization of care	1850 to 1899	1900 to 1964	1965 to 1970
	• Development of the Pennsylvania Hospital • Growth of medical and caring professions • Introduction of public health	• Beginning of advances in medical technology, training, knowledge and standardization of medical education • Formation of insurance plans • Hill-Burton Act	• Creation and expansion of Medicare and Medicaid • Growth in health services and medical specialization
Decentralization of care	1971 to 1980	1983 to 1985	1986 to 1990
	• Shift from inpatient to outpatient care begins • Beginning of cost containment efforts by insurers and government • For-profit hospital chains emerge	• Medicare prospective payment system enacted and implemented • Managed care gains market share • Growth in joint ventures between hospitals and physicians	• Freestanding ambulatory care facilities double • Many rural and secondary hospitals close • Hospitals diversify to counter market competition
Integration of care	1990s	1996	1999
	• Integrated Delivery Systems emerge as a result of consolidation, mergers, and acquisitions	• Over 55% of U.S. hospitals report being in an alliance	• 72% of hospitals reported being in an alliance

federal government had placed wage and price controls on war industries, so employers used health coverage for recruitment and retention.^[6]

Direct federal involvement in hospitals began in 1947. The Hill-Burton Act was intended to fund the construction of hospitals in rural areas, but amendments extended it to provide grants that matched the funds generated by a community.^[4] The federal government's involvement continued to grow in the mid-1960s with the creation of Medicare and Medicaid. These programs, along with employer-sponsored health insurance, increased the demand for hospital-based health services. Top managers of hospitals were referred to as administrators, and often had either clinical or accounting backgrounds.^[7] By the 1970s, hospitals were the center of medical activity, and the administrator's duties had become increasingly complex. Managerial competencies included not only communication, leadership, organizing, and planning skills, but also increasingly skills in conflict management and external relations.

Decentralization of Care

The 1980s and 1990s gave rise to the professionalization of health care management. Hospital administrators

were now referred to as chief executive officers (CEOs). The majority of CEOs were educated—as they are today—at the master's degree level in health services administration.^[8] A shift from inpatient care to outpatient care also occurred during the 1980s. Reimbursement incentives, continued medical advances, and the introduction of managed care were three factors that prompted the shift.

The enactment of the Medicare prospective payment system (PPS) in 1983 resulted in hospitals being paid a “predetermined amount for Medicare inpatients based on diagnosis-related groups (DRGs).”^[9] The PPS encouraged hospitals, physicians, and health care entrepreneurs to enter the ambulatory care arena. Ambulatory care takes place in various locales including urgent care centers, physician offices, hospital emergency rooms, and patients' homes. Increasingly, ambulatory care services are often the patient's first point of contact in the health care delivery system.^[10] This new form of medical practice required a new style of management practice. The traditional administrator who managed internal affairs now had to focus outward and compete for patients based on quality *and* on cost. Business skills gained currency, as assuming financial risk for the care provided, contracting with physicians, and marketing services were added to the already complex duties of the health care manager.^[11]

Moreover, medical technology permitted sophisticated procedures to be delivered in ambulatory rather than inpatient facilities.^[12] Between 1980 and 1990, the American Hospital Association reported that the number of freestanding ambulatory care facilities doubled.^[10] Many diagnostic and therapeutic procedures, as well as treatment, do not necessitate overnight stays, which plays to patients' preferences for accessible, convenient, and prompt care.

Finally, the growth of managed care expanded the ambulatory care sector. The financial incentive to provide care in an outpatient setting was a natural fit with the managed care philosophy of using gatekeepers to reduce costly hospitalization. As health care consumers continue to be vocal in their demands and medical technology continues to advance, the market for ambulatory care will increase.

Integration of Care

The 1990s were a decade of vertical and horizontal integration in the health care industry. To integrate in the health care industry means to bring together practitioners, hospitals, health plans, employers, and patients.^[13] Under this strategy, repetitive services are eliminated and the expense of technology is consolidated in an effort to streamline health care delivery. The increasing cost of delivering health care and patient's demands for convenient "one-stop shopping" were two of the drivers for integrated delivery systems (IDSs). In 1996, over 55% of America's hospitals were reported to be in an alliance;^[14] in 1999, that number rose to 72%.^[15]

Hospitals first ventured into horizontal integration. *Horizontal* integration consists of alliances between separate hospitals in an effort to become more efficient by creating economies of scale. *Vertical* integration is the merger and/or acquisition of health care providers at different positions along the continuum of care to improve efficiency and coordinate care across the entire organization.^[14] An IDS combines vertical and horizontal integration so managers have accountability at every level.^[5] Chief executive officers, departmental managers, and entry-level managers all must manage the expectations of stakeholders. Significantly, management competencies expanded from managing an organization to managing a network of services and alliances.^[16]

CURRENT TRENDS IN HEALTH CARE

The delivery of health services will continue to be buffeted by change (Fig. 2). Forces for change include advances in information and medical technology,

increased governmental regulation, growing consumerism, and aging demographics. Health care executives will have to manage conflicting values as they face pressures to contain costs while maintaining access and improving quality. Management trends addressing cost and quality concerns include the use of continuous quality improvement (CQI), population health management, and information technology.

CQI

Less than stellar results with static, quality assurance programs led to the health care industry's experimentation with total quality management (TQM), typically called CQI. Continuous quality improvement builds on traditional assurance methods, emphasizing all three of Donabedian's criteria: structure, process, and outcomes. CQI looks for improvement *opportunities*. Three practices distinguish CQI from previous quality assurance models: consumer-focus, systems thinking, and statistical quality control methods.

Continuous quality improvement recognizes the rise in health care consumerism.^[17] As consumers are becoming more knowledgeable about their health and health care delivery, they are demanding better care, better information, and better coordination of their care. The definition of quality of care has broadened in response to these social changes and now includes patient-provider interaction, the setting in which care is given, and quality of life.^[18]

"Customers," in CQI terms, are those people affected by a product or process, including both internal and external customers.^[19] External customers are patients, benefactors, payers, or purchasers of health care services. Health care providers, their colleagues, or other departments and services within the organization are internal customers. Continuous quality improvement encourages the development and use of methods to discover consumer needs and expectations.

"Systems thinking" recognizes that processes are interrelated.^[19] Continuous quality improvement avoids personal blame and focuses on the managerial and professional processes associated with an outcome.^[17] Continuous quality improvement involves each person associated with the process in the problem identification or quality opportunity phase and the actual redesign process. It encourages each member of the organization to see the process through to the end and consider the "big picture."

Quality circles and improvement teams that were popular in the 1970s and 1980s encouraged the use of statistical tools, but CQI requires these fact-based decision-making tools.^[17] Employees as well as managers, study possible causes and brainstorm

Fig. 2 Factors for change. (From Ref.^[1].)

systemwide solutions, requiring personnel educated in statistical analysis and control processes. “The use of data-based management and scientific principles to the clinical and administrative processes that produce patient care is what CQI is all about.”^[17]

Population Health Management

Population health management refers to the change in focus from caring for individual illnesses to encouraging the wellness and health of a population. An ideal system would deliver comprehensive and personalized preventive through tertiary care, while guiding and tracking patients through a continuum of services.^[14] Some health systems are now providing primary through tertiary care, as well as home and long-term care. More specifically, population health management relies on the evidence-based practices of catastrophic care, demand, disease, disability, and lifestyle.^[21]

These five forms of population health management have varying foci and benefit different stakeholders. Lifestyle management emphasizes reducing health risks and preventing illnesses by targeting a relatively healthy population, such as young employees. Demand management concentrates on consumer requests and inquiries for medical care services, supplying advice, counseling, and referrals to appropriate providers, thus lowering the costs and improving the efficiency of care seeking. Disease management focuses on individuals with chronic conditions, such as diabetes, congestive heart failure, or asthma, coordinating the services needed for these specific diseases. Catastrophic care management centers on providing health services for individuals with catastrophic illnesses or injuries, such as acquired immune deficiency syndrome or stroke patients. Disability management focuses on reducing injuries, preventing job-related illnesses, and managing employee disabilities. All health population management approaches add value by reducing costs and improving the quality of care.^[21]

Information Technology

Information technology (IT) is a valuable resource for CQI and population health management efforts. Information technology provides the foundation for the flow, storage, and analysis of data, converting it into usable information for making operational and strategic decisions.

More important, IT has the potential to radically transform the health care industry, improving quality and access while minimizing costs. Telemedicine demonstrates IT's benefits. Radiology, for example, is a common application within telemedicine that Medicare now covers. The managed care industry quickly saw the opportunity to contain costs through IT. By deploying IT, health service organizations can improve clinical outcomes, ensure patient safety, and streamline administrative tasks. However, without industrywide standards, the full benefits of IT cannot be realized.^[20]

Indeed, both population health management and CQI require a robust information infrastructure.^[22,23] Without an information infrastructure that connects all providers, insurers, third-party administrators, and employer/payers, effective disease and other population health management measures are much less efficient. At the same time, the coordination of care that results from establishing health networks is also more effective and efficient when an information infrastructure connects primary, secondary, and tertiary providers within and across communities.

CONCLUSION

Health care managers face the challenge of developing and managing delivery organizations that are internally complex, and involve external networks of other providers. Health care executives must manage conflicting values among internal stakeholders, while also managing complex strategic alliance relationships. Relational and strategic competencies, as well as abilities in managing technology, quality improvement, and population health are now prerequisites for health system CEOs. As health system managers develop information infrastructures, manage population health, and improve internal quality processes and outcomes, they begin to achieve a community health care management focus. The challenge for health care executives is both to articulate a vision, and to master the skills needed for managing these complex and emergent organizational forms.

Health Care Policy

Walter J. Jones

Medical University of South Carolina, Charleston, South Carolina, U.S.A.

INTRODUCTION

“Health policy” refers to the area of study that focuses on the outputs (products) and outcomes (final results) generated by a society that relate to the nature of the health services provided to the society’s population. The term also refers to the processes by which societies create these outputs and outcomes. This entry examines and analyzes the various issues related to health policy making and policies.

THE NATURE OF HEALTH POLICIES AND POLICY MAKING

All societies produce health policies. During the twentieth century, as medical science developed, societies began to refine their health care systems through policies created by governmental and private bodies. In most of Europe, this process was soon dominated by national governments. By the end of the twentieth century, most economically advanced nations had enacted health policies that provided for universal health insurance coverage for all citizens. In contrast, the United States enacted policies that resulted in a very well-funded, but relatively unorganized, health care system, with health insurance provided not by citizenship, but by employment status and, more recently, by age category (Medicare) and “qualifying poor” status (Medicaid).^[1]

THE HEALTH POLICY-MAKING PROCESS

Like other policy-making processes, health policy making is *cyclical*, not linear. It has no defined beginning or end. This also means that policy issues are never finally and completely resolved. Previous policy outputs and outcomes lead to further system inputs, which keep the process operating. In policy making, there are no final successes or failures.^[2]

The health policy-making process comprises four phases.

1. *Entry of Policy Inputs*: In this phase, policy-making institutions and individuals are exposed to stimuli for action coming from individuals,

groups, and institutions that comprise their relevant society. These inputs may include *demands* for policy making (or for opposition to proposed policy making), *supports* for previous policy making (including reelection to public office, or reappointment to an administrative or judicial position), *resources* for additional policy making (such as tax revenues), and *costs* incurred through previous policy making (such as budgetary debts, or the loss of political support as a result of previous policy decisions).

As a result of the relative impact of each input and their interactions, the *policy agenda* for the current cycle of policy making develops. The agenda includes the issues that policy makers will focus on in their current activities. Agenda setting is an important political skill for policy participants. It involves attracting public and policy maker attention through media publicity, published research, and other mechanisms. Some successful agenda settings are the result of such deliberative efforts (e.g., the efforts in the 1990s of groups such as ACT-UP to bring attention to the plight of people with HIV infection or AIDS). On the other hand, policy agendas are often set by the cumulative social results of previous policy making (for instance, the health care cost inflation in the United States mentioned below).^[3]

2. *Policy Formation*: Once policy agendas are set, policy makers work through existing institutions to enact preferred policy responses. In democracies such as the United States and the UK, this usually involves the interaction of executive, legislative, judicial, regulatory, and private sector institutions.

Some democracies, such as the United States, have policy institutions that were designed to prevent hasty or dictatorial policy making. They feature the separation of policy-making powers between governmental branches, the further division of policy-making powers between the national and state governments, and the potential review of much executive and legislative policy making by the judicial branch.^[4] Effective

policy making in some areas (such as tobacco industry liability) ends up in the courts, with lawyers representing the various sides dueling over one or more lawsuits.

Because of divided power, U.S. health policy making is often characterized by *incrementalism*, with prevailing policy making consisting of only modest and gradual adjustments of current policies. Reforms of large, complex, and popular programs such as Medicare and Medicaid usually do not involve radical change. On the other hand, many other democracies, such as the UK, have more unitary systems of government. With the British Parliament in fact controlled by a government with a strong Prime Minister, and only modest judicial review, it is easier for British policy makers to enact new laws.^[5] A countervailing advantage of the U.S. system may be flexibility and ease of experimentation. With some national programs such as Medicaid administered by the states with significant autonomy, it is possible for the United States to experiment with differing program coverages and methods of administration.

One other important feature of U.S. policy formation is the involvement of and, at times, control by private sector organizations. In the United States, slightly over half of health care spending comes from private sources, and most service deliveries are through private sector organizations. Consequently, private sector organizations have a significant amount of input into all health policy making. In some areas such as clinical certification and facilities accreditation, primarily private associations such as the Joint Commission for Accreditation of Health Organizations (JCAHO) have de facto control over far-reaching public policy functions.

3. *Policy Outputs:* Policy formation by the various institutions described above leads to policy outputs. Some outputs are very tangible. *Laws* are passed; P.L. 89-97, the Social Security Amendments, established Medicare for U.S. senior citizens in 1965, whereas the Balanced Budget of 1997 substantially lowered Medicare hospital reimbursement to curb rapidly increasing Federal Government expenditures. Laws can also come in the form of *subsidies* to relevant individuals or institutions; in 1990, P.L. 101-381, the Ryan White Comprehensive AIDS Resources Emergency Act, provided AIDS treatment funding for states and metropolitan areas heavily affected by the HIV-AIDS epidemic. Laws result in money and/or legal authority being allocated to other government bodies (federal,

state, or local), organized interest groups, families, and/or individuals.

In contrast, some policy outputs result from subsequent *regulatory decisions* rather than executive/legislative branch deliberations by elected policy makers. The Food and Drug Administration (FDA) effectively makes policy when it decides to withhold or withdraw medical products or devices from the market (as it did when it banned the use of the drug thalidomide in the 1960s). However, regulatory agencies derive their authority from executive and legislative branch mandates. At times, if their decisions create a sufficient public outcry, the other branches of government may act to rescind them. For example, because of public opposition, Congress overrode the FDA ban on saccharine in the 1970s.^[6]

In a similar fashion, policy making may flow directly from *judicial decisions*. A gridlock between the legislative and executive branches over tobacco policy was partially broken in the mid-1990s when public health lawyers and state attorney generals began to successfully sue tobacco companies in state courts over liability for Medicaid spending on tobacco-related illnesses. The hundreds of billions of dollars involved in the various suits prompted both sides to begin developing a nationwide settlement that would preempt further state legal action.

More nebulous, but very real, are variations in policy making that have been termed *symbolic politics* and *non-decision making*. Most policies have at least some symbolical intent, as the titles of some legislations suggest. For example, the 1996 law that ended the linkage between Medicaid and the primary public assistance program for families with children (Aid to Families with Dependent Children, or AFDC) was named the Personal Responsibility and Work Opportunity Act. This made the public point that there would be no more “free ride” for welfare recipients. The symbolical component of policies provides emotional satisfaction for political supporters of the policy makers and sends a more or less open warning to potential opponents.^[7]

A non-decision is the output of a policy-making body when it defeats a proposed policy initiative through inaction, rather than any overt decision.^[8] The most recent and important example of a non-decision was the 1994 defeat in Congress of President Clinton’s proposed Health Security Act (HSA), which would have established a universal health insurance program for Americans. After President Clinton sent the bill to Congress, its opponents mounted an

effective negative mass media campaign. Support for the bill dropped, and its opponents in Congress were able to prevent any vote on the legislation, either on the floor of Congress, or in any relevant committee. This non-decision preserved the decentralized status quo in U.S. health care organization and financing.

4. *Outcomes:* Health policies are intended to have some specific impacts, or to create a changed state of affairs, at some level of society. Examples of outcomes include situations in which enacted policies lead to defined groups of individuals receiving some enhanced access to health services, institutions receiving additional funding and/or legal authority, elected policy makers increasing their public popularity and ability to get campaign contributions, thus increasing their likelihood of reelection, and so forth. Most commonly, health policies aim to improve health care access, cost control, and/or quality.

However, policies often do not have their expected impact because their *implementation* varies in terms of efficiency and effectiveness. Imperfections in implementation will inevitably result in outcomes that are less significant than expected. For example, one of the health policy outputs of the 1997 Balanced Budget Act was funding for the establishment of State Children's Health Insurance Programs (SCHIPs). The intention was to increase health insurance coverage for children. However, current research shows that state implementation of these programs has been quite uneven.^[9]

Because health policy making usually involves considerable complexity and uncertainty, there is often a significant gap between intended and actual outcomes.^[10] Sometimes important policy outcomes are unintended and unexpected. When enacted in 1965, the intended outcomes of Medicare and Medicaid included increased access to health services for senior citizens and some categories of the poor. However, the increased health spending and increased utilization were also primary factors in the U.S. health care cost inflation that has persisted to this day.

U.S. HEALTH POLICY OUTPUTS AND OUTCOMES: 1965–PRESENT

Since 1965, the United States has far outspent every other nation in the world, both in the aggregate and per capita, in health services. With the Federal Government taking the lead, public policies that dramatically expand the governmental role in organizing, financing, and delivering health services have been enacted.

The list of health policy outputs since 1965 is extensive. Programs such as Medicare and Medicaid have significantly extended health insurance to defined population categories. The Federal Government has also spearheaded a movement to improve health services through more effective research into health outcomes, subsequently linked to clinical and organizational improvements. In 1989, the Agency for Healthcare Research and Quality (AHRQ) was established. It works with academical and industry researchers to advance health outcomes measurement, analysis, and applications.^[11]

In reaction to the rapidly growing portion of the gross domestic product devoted to health care, the Federal Government has steadily put cost containment measures into place, including a Prospective Payment System (PPS) for hospital Medicare services in 1983 (P.L. 89-97) and a Resource-Based Relative Value Scale (RBRVS) for physician Medicare reimbursement in 1989 (P.L. 101-239). Most recently, the 1997 Balanced Budget Act reduced Medicare and Medicaid provider reimbursements by an estimated US \$128 billion in 5 years (but recently, the provisions of the Act have been significantly relaxed).

State governments have also been active health policy makers.^[12] Many states have experimented with new delivery systems in their Medicaid programs, and the general range and level of benefits have gone up steadily in the last 20 years. Some states have instituted nearly universal employer-based health insurance systems (Hawaii), or have attempted to greatly expand health insurance coverage through state mechanisms (Tennessee).

With all of the above-mentioned public policy *outputs*, how have health *outcomes* been affected? It appears that public policies have, at best, a limited impact on population health. Some public health measures, such as disease immunization and water purification, have dramatically affected life expectancy in the last century. However, beyond that, it appears that most health outcomes are the product of overall environmental conditions and individual lifestyle behaviors, not health policy measures.^[13] Because of less effective prenatal care, along with less healthy population lifestyles, Americans on average have a shorter life expectancy than most citizens of advanced Western European and Asian nations. To improve these results, American policy makers must develop more effective methods of health education.

TWENTY-FIRST CENTURY HEALTH CARE POLICY CHALLENGES

In addition to the ongoing task of cost containment balanced with reasonable access to the ever-expanding

array of medical technologies, the twenty-first century will see the development of additional health policy challenges.

Health Disparities and the Market

As medical technologies develop, the gap between possible treatments and available resources to pay for these treatments grows. All societies, including the United States, will have to find some acceptable ways in which to ration the most expensive medical technologies. How will this be done? From a pure efficiency standpoint, the best way to ration resources is through the use of market mechanisms, such as price. The United States has already gone farther than most countries in turning health care over to markets as an economic commodity.

However, markets that are somewhat “free” imply that those who cannot pay will go without. To what extent are Americans willing to accept this? The United States already has significant disparities in medical access. If the United States wants to keep some semblance of rough equality in the provision of essential health services, it will have to increase its subsidies to the medically indigent to keep pace with the growing cost of care. If Americans are unwilling to do this, the nation could wind up with enormous and growing gaps in medical access between social groups—gaps large enough to create future political unrest.

Genetic Technologies

With the ongoing mapping of DNA coming from the Human Genome Project, twenty-first-century health providers will increasingly have the ability to directly intervene in human genetic structures and functioning. This potentially means the ability to treat, or even prevent, the development of genetically based disorders, including cancer and cardiovascular diseases. Success here could materially increase average human life span, from the current 70–80 to 130 years or more.^[14] This increase, if attained, would be a mixed blessing, bringing on funding challenges in geriatric health care that dwarf our current problems.

Growing abilities to manipulate human genetics would also give us the ability to eliminate almost *any* genetic feature, not simply those generally considered undesirable. Thus, there could be sharp policy debates over the social and ethical implications of using genetic medicine to select (or eliminate) actual or potential offspring by gender, physical appearance, or expected intelligence.

CONCLUSION

Based on the above suggestions as to twenty-first-century health policy challenges, one of the insights provided earlier should come to mind. Health policy making does not “solve” problems in a once-and-for-all fashion. Often, current problems that policy makers face result from prior policy initiatives that were and still are considered successes. It should not be hard to imagine future policy scholars drawing the same conclusion about such twenty-first-century advances as genetic medicine. The more things change, the more they remain the same.

INTRODUCTION

Health care organizations are unique. Hospitals, for example, are different from other organizations in both the private and public sectors, and their differences make the management of change much more difficult. In contrast to industrial firms, for example, hospitals have the following characteristics:

- They tend to be more vitally important to society.
- They have more highly differentiated, specialized, and complex organizations.
- They contain four major power groups (physicians, nurses, administrators, and boards of trustees) with different interests, poor communication, and weak linkages.
- They are dominated by one power group (physicians) who are socialized as professionals, assume cosmopolitan roles, and function autonomously and independently from the rest of the organization.
- They produce personal, unique services with an unusually strong emphasis on quality.
- They have vague goals, produce results that are difficult to measure, and show little standardization among organizations.
- They tend toward random delivery of services with little organizational control.
- They are less adaptable to planned change, because so much of the energy is devoted to adapting to the external environment.
- They provide fewer incentives for effective management, primarily because effective management is not highly valued by the physicians.
- They experience greater and more complex levels of intraorganizational interdependence among professionals and non-professionals.
- They need many highly trained and technically competent professionals with related but often mutually exclusive skills and expertise.
- They are staffed by personnel who are often unwilling to take risks and try new modes of delivery.
- They are paid for good intentions and programs, rather than for their products and results.
- They are subject to government regulation that has an immediate and far-reaching impact on the industry, particularly in terms of reimbursement patterns.
- They are often controlled by insurance companies that make reimbursement decisions (in terms of the amount of reimbursement and the services for which the hospital will be reimbursed), and determine from what institutions patients can receive treatment. This takes the decision for health care services out of the hands of the physicians and puts them into the hands of bureaucrats and administrators.
- Their personnel populations have reached almost a crisis point because of increased demands for services (due to the aging population) and the decreased numbers of people entering the health care field.
- They are far more interdependent, to the point that it is impossible for some departments to deliver services to patients without the cooperation of many other departments. Indeed, if one department, such as the pharmacy, fails to do its job, it can practically close down the entire organization (Adapted from Ref.^[1], pp. 15–16). Given these differences, many consultants and health care administrators find the process of change difficult to manage. However, the research indicates that significant changes can take place when those involved in the change process pay attention to the unique characteristics of health care organizations.

ORGANIZATION DEVELOPMENT

The typology used here comes from an Organization Development (OD) perspective. Although the definitions of OD vary significantly, the most widely accepted is that given by Beckhard: “Organization development is an effort that is planned, organization wide, and managed from the top to increase organization effectiveness and health through planned interventions in the organization’s processes, using behavioral science

knowledge.”^[2] OD has a long-range focus. It is designed to improve an organization’s health, efficiency, and effectiveness in effecting change, reaching decisions, and taking advantage of the full potential of the organization’s most valuable resource: its people. In short, OD applies behavioral science knowledge to facilitate change, to build skills in people, and to resolve problems, whether personal, interpersonal, intragroup, intergroup, or organizational (see Ref.^[1], p. 18).

THE ACTION RESEARCH MODEL

The basic approach of most OD practitioners is to use the action research model, a data-based, problem-solving model designed to replicate the scientific method of inquiry (for a general discussion of action research, see Ref.^[3]). The specific steps in the action research model include data collection from individuals and groups within the organization, feedback of the data to the organization personnel, problem diagnosis, and action planning and interventions within the system. Once the interventions have been completed, additional data are collected and fed back to the client system, problems are diagnosed, and additional action planning of subsequent interventions takes place. Thus, implementation of the action research model involves a cycle of interactions designed to provide immediate feedback to the client on the status of problems within the system. Action research, therefore, implies a meaningful link between research and action and connotes action based on valid information. It is important to realize that each phase of the action research model constitutes a clear intervention into the client system (Ref.^[4], p. 260).

OD INTERVENTIONS

The term “OD interventions” refers to a range of structured activities designed to resolve problems and enable personnel to develop and maintain healthy organizations. These methods and techniques can be implemented by the client and the consultant and constitute an evolving array of methods and techniques, based on the diagnosis of the problems and the needs of the client system.

Although few OD projects include all possible intervention activities, the following constitutes a generally agreed upon set of definitions for the major types of OD interventions.

- *Team building*: Activities designed to enhance the effective operation of system teams.
- *Intergroup activities*: Activities designed to improve effectiveness of interdependent groups. They focus on joint activities and the output of groups considered as a single system rather than as two subsystems.
- *Survey-feedback activities*: Although related directly to the diagnostic process described above, these activities tend to become an ongoing process in the organization. Data collection activities, in the form of questionnaire surveys of the target population and interviews with key personnel, take place on a regular basis. The data are analyzed, problem areas are identified by the organization’s leadership, and action plans are developed to deal with problems related to the total organization. The data are then shared with the organization’s personnel in department or division meetings, and specific action plans are formulated for problems that relate to the specific units.
- *Education and training activities*: Activities designed to improve skills, abilities, and knowledge of individuals. The activities may be directed toward technical skills required for effective task performance or may be directed toward improving interpersonal competence. The activities may be directed toward leadership issues, responsibilities and functions of group members, decision making, problem solving, goal setting, planning, and so on.
- *Technostructural or structural activities*: Activities designed to improve the effectiveness of the technical or structural inputs and constraints affecting individuals or groups. The activities may take the form of experimenting with new organization structures and evaluating their effectiveness in terms of specific goals or devising new ways to bring technical resources to bear on problems. Structural interventions are defined as the broad class of interventions or change efforts aimed at improving organization effectiveness through changes in the task, structural, and technological subsystems. Included in these activities are certain forms of job enrichment, management by objectives, collateral organizations, and physical settings interventions.
- *Sociotechnical systems*: Activities designed to focus simultaneously on the technical systems and the social systems of the organization. Such activities often involve the restructuring of work methods, rearrangements of technology, or the redesign of organizational social structures. The objective is to maximize the “fit” between the technical system and the human system. Often, the implementation of sociotechnical systems involves the creation of work teams or autonomous work groups, which are responsible for a specific product or output. The concept, originally developed in London at the Tavistock Institute of Human Relations, has had broad applications in mines and factories in

England and the Scandinavian countries. Successful sociotechnical interventions have also been reported in joint United Auto Workers-General Motors plants in the United States.

- *Process consultation*: Activities on the part of the consultant to assist the client in perceiving, understanding, and acting upon process events that occur in the client's environment. Specific emphasis is placed on the human processes that occur at the individual, interpersonal, and intergroup levels. These processes include communications, group problem solving and decision making, the functional roles of group members, group norms and group growth, leadership and authority, and intergroup processes. Because organizations are made up of networks of people, with these processes continually occurring between them, the objective of process consultant activities is to help the client gain the skills to understand, diagnose, and manage such processes effectively.
- *Third-party consultation*: Activities conducted by a skilled third party, which are designed to resolve problems regarding interpersonal or substantive issues and help those parties deal effectively with their conflict. Such interventions involve conflict resolution in superior-subordinate and peer relationships. Among the substantive issues are disagreements over policies and procedures, different conceptions of roles, and competition for scarce resources. The interpersonal issues often involve feelings of anger, distrust, fear, scorn, resentment, or rejection.
- *Coaching and counseling activities*: Activities that involve the consultant or other organization members working with individuals to help them define learning goals; learn how others see their behavior; and learn new modes of behavior to see if these help them to better achieve their goals. A central feature of this activity is the non-evaluative feedback given by others to an individual. A second feature is the joint exploration of alternative behaviors.
- *Life and career planning activities*: Activities that enable individuals to focus on their life and career objectives and how they might go about achieving them. Structured activities lead to production of life and career inventories, discussions of goals and objectives, assessment of capabilities, needed additional training, and areas of strength and deficiency.
- *Planning and goal-setting activities*: Activities that include theory and experience in planning and goal setting, utilizing problem-solving models, and the like. The goal of all such activities is to improve these skills at individual, group, and organization levels (see Ref.^[4], pp. 262–265).

A MODEL FOR CHANGE

Golembiewski provided a model of organizational change that has proven effective in a number of different settings. Specifically, to introduce change into simple systems, he suggested include the following:

1. Move slowly.
2. Implement one innovation at a time.
3. Precede each step with ample warning.
4. Accompany each step by a statement of reasons and benefits.
5. Offer maximum opportunities to participate.
6. Provide outlets for inevitable hostilities.

Occasionally, harsh or dramatic changes are desirable; sometimes it is the only way to facilitate change. When the manager feels it practically necessary or morally defensible to so induce change, that manager simply will neglect the above list. Even then, however, the manager can expect a low probability of success and should anticipate much time and effort sweeping up afterwards.

A comparable list of steps for changing complex more systems is less straightforward or complete. At least fragmentarily, then, the managerial change agent intent on affecting a complex system should keep such general guidelines in mind:

1. Changes in any subsystem often require changes in other systems.
2. Changes at any one level of organization often require changes at the level above and below.
3. Change is usefully begun where stresses exist.
4. Planning any change should involve formal and informal organizations.
5. The higher the level at which change begins, the greater the chances of success.^[5]

Given the complex nature of health care organizations, change agents in hospitals do well to adhere to the guidelines suggested for complex systems, particularly given the highly interdependent nature of health care organizations. For example, the leaders of an outpatient surgery department in a major medical center decided to move the nurses' station from one side of a room to the other. This change directly impacted 29 other departments.

THREE CASE STUDIES

Given the challenges currently facing health care, one would expect it to prove a fertile field for applying OD technology. Consider, for example, the following applications of OD technology to a variety of different

health care settings (materials in this section is adapted from Ref.^[1], pp. 1–2):

Lincoln Hospital's Operating Room

Lincoln is a 400-bed for-profit hospital and medical center located in the southwestern United States. Lincoln had long had trouble with egotistical and dictatorial physicians who constantly threatened to take their patients elsewhere if their demands were not met. Historically, the hospital administration had catered to these doctors, even firing nurses who had alienated particular physicians.

Mary, the OR director for 13 years, had a reputation as being a conservative, strong-willed, strict constructionist who would brook no deviations from hospital rules. Don, the incoming chief of surgery, was an outspoken critic of the hospital. Nurses and administrators feared his sharp tongue, quick temper, and critical disposition, but Mary was not the least bit intimidated by his behavior, and the two had openly clashed on numerous occasions. Faced with the new broom's need to make a difference, Don openly declared that his major goal for his first year as chief of surgery was to have Mary fired.

One year later, following multiple OD interventions, Mary had successfully completed her 14th year as OR director. Not only did she and Don trust each other, but the two had engineered some major changes in the surgical services area, including a decrease in the turnover rate among surgical nurses from 40% to zero, a resolution of the difficult problem of scheduling operations for a group of *prima donna* surgeons, and a significant decrease in physicians' verbal abuse of nurses.

Manchester Nursing Services Division

Manchester hospital and medical center is a 300-bed for-profit facility located in the northwestern United States. Although all of Manchester's 900 employees generally felt frustrated with the problems facing the organization, low morale was most pronounced in the 500-employee nursing services division. Several factors contributed to the nurses' dissatisfaction: the decentralization of nursing management, enormous technical and managerial problems for the new managers; an almost 100% turnover among head nurses; mistakes in filling key management positions; distrust for the administration; and physician abuse. The nurses felt unappreciated, undervalued, and powerless in dealing with the administration and with the physicians, and the turnover rate among nurses had fluctuated between 30 and 40% for the previous four years.

Three years later, the Manchester nursing services division achieved significant improvements in organization climate and group effectiveness. The turnover rate among nurses dropped from over 32% the year before the OD project started to 5.8% the third year. This decrease in turnover saved Manchester over \$1.5 million during the three-year period.

City Hospital and Medical Center

City Hospital is a 250-bed denominational hospital and medical center with 850 employees, located in a fast-growing southeastern city. After holding his position for 10 years, the hospital's administrator had run into trouble with the medical staff, the employees, and the corporate board, and had left for a hospital in a different region.

The new administrator inherited several serious problems: a lack of effective leadership, ineffective communication, poor decision making, an absence of planning, a hostile medical staff, a poor public image, dissatisfied nurses, an employee population that felt overworked, underrewarded, and burned out, and serious financial problems (to the point that the hospital had recorded its first financial loss in over 50 years).

Three years later, the number of City Hospital employees in the advanced stages of burnout had decreased by 31%. Net revenue as a percent of gross revenue (profits) showed double-digit increases, and market share had increased by 6.3%. Days of revenue in gross accounts receivable were down by 18.9 days, for an increase in revenue of approximately \$2,835,000 during the three years. In addition, employee turnover dropped from over 25% to 4%. By the most conservative estimates, the hospital had saved over \$2 million in recruitment costs for registered nurses alone during the three-year period.

ESSENTIALS FOR SUCCESS

The purpose of OD is to improve an organization's effectiveness in making decisions, accomplishing its missions, and in reaching the full potential of its people. Successful OD efforts will simultaneously create a regenerating system characterized by trust, openness, a flow of accurate information, freedom for individuals to grow and develop, and a minimal interpersonal risk or perceived threat. Under such conditions, minimal resistance to change is generated, and a high level of collaboration is ensured (material in this section is adapted from Ref.^[1], pp. 102–105).

Of course, not all OD efforts attain these objectives. Often, the project is doomed to failure simply because many essential elements of effective change are

missing. A successful OD project will include the following variables:

1. Commitment of the chief executive officer.
2. Cultural preparedness in the organization.
3. Realistic expectations about the success of the project.
4. Internal tension and pain.
5. Involvement of other people in positions of power.
6. Development of internal resources.
7. Methods for holding people accountable.
8. A competent consultant.
9. A clear psychological contract between the CEO and the consultant.
10. Technically competent supervisors.

Commitment of the Chief Executive Officer

The CEO is the single most important person in the change effort, largely because the CEO controls the reward structure, which in turn, controls individual behaviors. Two further examples illustrate this point.

First, 37 top-level administrators in seven criminal justice agencies participated in a 6-day confrontation team building meeting. Thirty-three were members of six natural teams or organizational family groups. The remaining four comprised a cousin group from a seventh organization. Cousin group members represented four different departments in a state agency. No two members reported to the same supervisor. The major variable among the six natural teams was that only one team met with its CEO. Although the natural team with the CEO showed significant improvement between the before and after scores on standard organization climate measures, the five leaderless teams, the cousin group, and a comparison group showed no statistically significant change.

Second, a seasoned hospital administrator retained a consultant and launched a major OD effort. During the next two years, the consultant worked closely with the administrator, his administrative council, and department managers to resolve problems, open channels of communication, enhance cooperation, and increase organizational effectiveness. Hospital personnel, however, perceived the administrator's behavior to be incongruent with the values of openness, honesty, and candor that he had professed to espouse. They saw him as deceitful and manipulative and felt that OD was a gimmick. Two years after the project began, the consultant quit; six months later, the administrator was fired.

Within two months, a new administrator was appointed. He immediately hired the same consultant and began another 2-year OD effort, with the same

people and the same objectives. Both projects were characterized by the following:

- The same consultant was employed.
- The consultant used the same approach.
- The consultant spent approximately the same number of days in the organization each year.
- The organization experienced little turnover, and there was none among the administrative council level.
- The general approach to hospital work was the same.

The only major difference was the person who served as administrator. Data collected at the start of the first OD effort, 2 weeks before the administrator was fired, and 2 years after the new chief was hired, showed that the organization retrogressed between the first and second data collections but improved significantly in organizational climate and leader effectiveness by the time of the third collection.^[6]

The results of these and other studies suggest that the CEO is the single most important factor in determining the success or failure of an OD effort. Without the CEO's total support, the potential for a successful OD project is questionable at best; if that support is marginal, the OD project should not be started at all.

Cultural Preparedness

To achieve lasting change, an organization must be culturally prepared; that is, its employees' psychological energies must be directed toward achieving, not sabotaging, the organization's goals. Below a certain threshold of organizational health, successful OD efforts are impossible. Important elements of cultural preparedness include interpersonal trust among employees, their willingness to resolve problems, their willingness to be held accountable, and their psychological health.

Interpersonal Trust

Trust is essential to organizational effectiveness. People who trust each other are significantly more effective in group problem solving than people who do not. The degree to which people trust one another determines the degree to which they will communicate honestly, share relevant information, try to control others, and permit others to influence their own behavior and decisions. The level of interpersonal trust at the outset of an OD project is typically an accurate indicator of the potential success of the effort. If trust has degenerated below a minimum level, the consultant or manager must scrap the project or replace the

offensive party. Without minimal trust, the chances of successful changes are practically zero.

A Willingness to Resolve Problems

Organization development, by definition, involves problem solving. Those involved must be willing to resolve their problems or change cannot take place. For example, in one client organization, the line personnel had major conflicts with their supervisors. During the diagnostic phase of the project, the consultant interviewed all the parties, but 60% of the line personnel refused even to sit down in the same room with their supervisors and discuss the problems. Under such circumstances, the objectives of OD could not be achieved; only power-oriented, win-lose behavior would have resolved problems.

A Willingness to be Held Accountable

Effective managers are not only able to hold employees accountable but also willing to be held accountable themselves. Competent people generally appreciate such responsibility. Incompetent people, on the other hand, resist it, because it exposes their weaknesses and inabilities.

Psychological Health

Although psychological health is relative, people must have a minimum level to resolve conflict effectively. Without it, supportive confrontation is difficult. If most of the members of a group need intense therapy, rational problem solving is impossible.

Realistic Expectations

Everyone involved in an OD project must understand at the outset that it is a long-range project requiring a substantial investment of time and energy. It took time to create the problems, and they should not expect those problems to be resolved quickly. Realistic expectations can prevent the anxiety, frustration, and tension associated with most change efforts.

Internal Tension and Pain

Any successful OD project results from recognizable discomfort, tension, and pain. Without a felt need for change, particularly among the administrators, no change can occur. Organizational change efforts have

a high probability of success only when the individuals involved have been experiencing internal stress.

Involvement of People in Power

Change efforts, where possible, should start with top-level administrators but must involve the informal (natural) leaders of the rank and file. Their support and cooperation can mean the difference between success and failure.

The Development of Internal Resources

Internal resources must be developed to ensure that the organization remains healthy after the consultant leaves. Without such resources, it remains dangerously dependent on the external consultant. This resource development can take two forms: intense managerial training and educational programs can build managerial competence throughout the leadership; or a few employees can be trained as internal change agents. For the latter, areas of emphasis should at least include process consultation, conflict management, team building, data gathering, problem diagnosis, and personnel training.

Methods for Holding People Accountable

Effective managers must be able to hold people accountable for the fulfillment of their responsibilities. One method used in the studies reported in this book is the personal management interview. Regular meetings between supervisor and subordinate provide opportunities for sharing information, training, building technical skills, dealing with interpersonal issues, and holding employees accountable. Notes of each meeting are kept, and action items are reviewed during subsequent meetings to ensure followup.

A Competent Consultant

Although many changes can be effected by resources within the organization, the objectives of OD generally require the help of someone outside it. Obviously, caution should be exercised in selecting that person. A client-consultant relationship, like a marriage, requires a great deal of interdependence and trust. The CEO should consider whether the consultant has the professional skills necessary to help diagnose and solve the problems and the interpersonal skills necessary for a trusting and open relationship with company personnel. The CEO should thoroughly interview

consultants and check with their previous clients, especially those in similar organizations.

A Clear Psychological Contract Between the CEO and the Consultant

It is absolutely essential that the consultant and the CEO reach a clear understanding about all aspects of their relationship before the consultant enters the system. They must spell out the client's expectations of the consultant and OD effort, the consultant's expectations of the client, the problems to be solved, the phases of the project, and the parameters within which the consultant and client will work. Such a psychological contract prevents misunderstandings and difficulties during the OD project.

Technically Competent Supervisors

Although not so central as the other essentials, the technical competence of the supervisors, especially the top administrators, is a major factor in successful change efforts. This factor is particularly important in occupations with a high degree of interdependence and personal risk. When subordinates put their destiny in the hands of someone else, the technical competence of the critical others is essential.

CONCLUSION

The factors listed above do not include all of the variables that may contribute to an effective change effort; and most consultants can cite cases where change efforts were successful in the absence of one or more of these conditions. Ignoring any of these essentials, however, will greatly hamper the change effort and substantially decrease the prospects of achieving the objectives of OD.

Health Care, Assessment and Evaluation of

Leiyu Shi

Department of Health Policy and Management, Johns Hopkins University,
Baltimore, Maryland, U.S.A.

INTRODUCTION

This article provides an overview of assessment and evaluation of health care. It describes the purposes, characteristics, and applications of health care evaluation. It delineates the process to conduct evaluation including determining the scope of evaluation, getting acquainted with the program to evaluate, finalizing the methodology for evaluation, collecting data, analyzing data, and reporting findings. The article will benefit those intent on conducting evaluation studies or critiquing evaluation work.

BACKGROUND

Assessment and evaluation of health care, or health care evaluation for short, is the systematic application of scientific research methods for assessing the conceptualization, design, implementation, impact, and/or generalizability of health services programs. It may be used for program monitoring and refinement, or for policy application and expansion.^[1,2] The first purpose centers on the health service or program itself. It aims at finding out how a program actually operates, whether the program has fulfilled its objectives, and what improvements can be made toward program operations. In particular, evaluators are interested in addressing the following questions: How has the program been implemented compared to program plans? What are the characteristics and numbers of the beneficiaries? What are the strengths and weaknesses in its operations? To what extent has the program served its intended beneficiaries? What is the dropout rate? How cost-effective is the program? How cost-efficient is the program? What is the impact of the program? How can the program be improved for the future?

The second purpose goes beyond the program itself by analyzing the extent to which health policies achieve

particular effects and assessing whether the program can be expanded or applied to a different setting. Evaluators are concerned about the following: How generalizable are the findings regarding the program? What is the potential of the program being applied to other settings? What are the conditions for such an application? What will be the costs and intended benefits?

The difference between these two purposes is that the first purpose is limited to improving effectiveness of a specific program within that setting. There is no attempt to generalize findings beyond the setting in which the program is operating. The second purpose serves to enlighten policy makers or funders by providing relevant information for decision making regarding program modification, refinement, expansion, or promulgation. Such evaluation can inform action, enhance decision making, apply knowledge to solve health problems, help set priorities, and guide the allocation of scarce resources.

Health care evaluation has a number of characteristics.^[3] First, it is technical. Using established research methods, researchers design, implement, and assess a health-related project in a way that is reproducible by others. Rigorous application of scientific methods is necessary for the evaluation results to be valid and legitimate. Thus evaluators must be conversant with research methods commonly used for evaluation.

Second, health care evaluation is applied. In contrast to basic research, evaluation is undertaken to solve practical health problems and to have some real-world effect. It seeks to understand pressing organizational or societal problems and identify potential solutions. It studies the processes and outcomes of the attempted solutions. The researcher translates between the academic discipline and the world of action. The evaluator is often paid by the client who may be manager or administrator in a business, government, service, or private funding agency. The criteria for judging evaluation include its ability to provide useful knowledge, its utilization by decision makers, and its impact on health programs or conditions. Because the value of evaluation depends on its utilization by others, evaluators must be knowledgeable about the social dynamics of the setting in which they perform evaluation as well as the subject matter related to the evaluation.

Adapted from Shi, Leiyu, *Health Services Research Methods*. Albany, NY: Delmar Publishers, Inc., 1997, Chapter 9. Evaluation Research. pp. 182–214.

Third, evaluation should be objective. Program funders, administrators, and evaluators all have the duty of making the evaluation objective. On the part of program funders and administrators, the results of evaluation should not be tied to the current or future reward for the evaluator. If evaluators are personally or financially tied to the project they evaluate, they may be loath to report negative findings. Evaluations conducted under these circumstances may err in the direction of praise. On the part of evaluators, planning and conducting an evaluation often requires rapport, trust, and frequent interaction with program administrators. Evaluators should not let the process of gaining trust and rapport color their perspectives. Regardless of where or how they are employed, they need to find viable ways to maintain integrity, objectivity, and an appropriate sense of differentiation.

EXAMPLES OF HEALTH CARE EVALUATION

The field of health care evaluation is marked by diversity in disciplinary training, perspectives on appropriate method, and diversity in evaluation activities and arrangements. The major types include needs assessment, process evaluation, outcome evaluation, and policy analysis.^[2-4]

Needs Assessment

The purpose of needs assessment is to identify weaknesses or deficiency areas (i.e., needs) in the current situation which can be remedied or to project future conditions to which the program will need to adjust. The decisions following a needs assessment usually involve allocation of resources and efforts to meet high identified needs.

Needs assessment has several applications. It can be used to identify goals, services, problems, or conditions which should be addressed in future program planning. Important questions to be addressed include: What are the goals of the organization or community? Is there agreement on the goals from all groups within the organization or community? To what extent are these goals being met? What are the areas in which the organization is most seriously failing to achieve goals? What do clients perceive they need? What problems are they experiencing? How effective is the organization in addressing problems perceived by clients? What are the new challenges affecting the organization or community? How can those challenges be met? What additional resources are necessary in meeting the challenges?

Needs assessment is also used to determine the need for additional health services or providers in a

community. First, the need for the particular health service or provider in the relevant service area is examined. A trend study is usually necessary because the new service is likely to impact the service area population not immediately, but rather some time in the future. The second step is to look at the supply component in the given service area. Similarly, a trend analysis is necessary to project the future service level when the new competitor will be in the market. The third step is to assess if a gap exists between estimated requirements and estimated supplies. Finally, a determination is to be made regarding new entrance need based on the size of the gap and the impact the new service and provider will have on existing services and providers.

Process Evaluation

Process evaluation focuses on how a particular program operates. It is concerned with the activities, services, materials, staffing, and administrative arrangements of the program. Process evaluation is conducted not so much as to decide whether to continue or drop a program. Rather, it is conducted to monitor the implementation of the program, to find out how a requirement or procedure has been implemented by program administrators, where things are going as planned, where they may deviate from planned directions, and what factors are associated with such deviation. Monitoring also may include assessing whether program activities comply with legal and regulatory requirements—for example, whether affirmative action requirements have been met in the recruitment of staff and whether discrimination exists in the selection of clients. As a result of process evaluation, modifications may be made in the activities, services, staffing, organization, and other aspects of the program either to correct an unintended deviation from the plan or to address an unexpected problem encountered in the implementation stage.

There are many reasons for monitoring the process of implementing a program. First, program monitoring ascertains that program administrators conduct their day-to-day activities efficiently and, if not, identify ways to enhance efficiency. Second, program funders, sponsors, or stakeholders require evidence to indicate that the program is being implemented as planned and for the purpose that it was paid for. Third, process evaluation identifies unexpected problems that need to be corrected immediately rather than wait for the end of the normal duration of the program. Fourth, process evaluation is often a prelude to outcome evaluation. There is no point in assessing the impact or outcome of a program unless it has indeed taken place in the way intended. Finally, monitoring program costs

and resource expenditures provide essential information for estimating whether the benefits of a program justify the costs.

Important questions to be addressed include: What are the critical activities, services, staffing, and administrative arrangements, etc. in the program? How are resources including staff, money, and time allocated? What is a typical schedule of activities and of services? How are program activities supposed to lead to attainment of program objectives? How many participants and staff are taking part in the program? How are the important components of the program operating? To what extent has the program been implemented as designed? To what extent has the program reached its target population? What are the resource expenditures for providing a service? Is the program implemented efficiently? How can the program be more efficiently carried out? What adjustments in program management and support are needed? Are there any problems encountered in program operation? If yes, what is the nature of the problems? How can they be solved?

Many of the data elements required for process evaluation can be incorporated in a Management Information System that routinely collects information on a client-by-client basis about sociodemographic data, services provided, staff providing the services, diagnosis or reasons for program participation, treatments and their costs, impressions of outcome, and other comments. The information is essential for program monitoring as well as assessment at a later stage.

Outcome Evaluation

Outcome evaluation is concerned with the accomplishments and the impact of the program, and the effectiveness of the program in attaining the intended results. The purpose is to collect and present information needed for summary assessment about the program and its value. Program effectiveness is tied to its intended goals which are usually stated in terms of participants' outcomes. Examples can be health status (e.g., recovered from an illness), behaviors (e.g., primary care visits), performance (e.g., stop smoking), cognitive (e.g., knowledge or skill gained), or affective (e.g., satisfaction level). While evaluators primarily emphasize explicit program goals, they also notice unanticipated or unstated outcomes, both positive and negative. Outcome evaluation examines the extent to which a program's goals are or are not being achieved. The results of outcome evaluation may assist the sponsors or decision makers in deciding whether to continue or discontinue a program, or whether (and how) to expand or reduce it.

To judge whether the program is successful or not, evaluators often compare program's accomplishments with some comparable standards, such as the results of the status quo or some competing alternative programs with the same goals. Even if a program is not totally successful, evaluators may conduct an impact assessment that gauges the extent to which the program causes change in the desired direction. Because of resource constraints, in most cases, knowledge of program accomplishments alone is insufficient; the results produced by a program must be judged against its costs. The program's effects and costs are contrasted with those produced by an alternative program with the same goals. Programs that are cost-effective are preferred to those that are either ineffective or effective but costly.

Important questions to be addressed include: What are the goals of the program? How are they measured or assessed? What programs are available as alternatives to this program? How are the program's essential components (e.g., activities, services, staffing, and administrative arrangements) tied to achieving program goals? Why should these components contribute to achieving goals? Does the program move toward goal achievement? How successful is the program in accomplishing its intended results? What conclusion can be made about the effects of the program or its various components? Has progress been made toward meeting the program goals? Which activities or services best accomplish each of the program goals? What gaps exist in meeting the program goals? What adjustments in the program might lead to better attainment of the goals? Is the program or some aspects of it better suited to certain types of participants or certain settings? How effective is this program in comparison with alternative programs? How costly is this program in comparison with alternative programs? Are there unanticipated outcomes associated with the program? If so, what are they? Should the program be discontinued, continued, expanded, or modified?

Policy Analysis

Policy analysis lays out goals, uses logical processes to evaluate identified alternatives, and explores the best way to reach those goals. It rarely aspires to the standards of traditional academic research which are supposed to be able to withstand the scrutiny of time, and the continuing probes of fellow investigators. An analysis that can be finished until after the decision must be made is not useful to the decision maker. The purpose of policy analysis is to inform the decision maker, providing the best analysis possible given the limitations on time, information, and

resources. Analysis is presented not to overwhelm the decision maker with methodological details, rather in such a way that the essential points can be readily grasped. By relying on the analytic techniques developed in economics, mathematics, operations research, and systems analysis, policy analysis strives to improve our ability to predict the consequences of alternative policies, provide a framework of valuing those consequences, and make rational and better decisions.

The five-step framework^[4] for policy analysis includes: 1) establishing the context; 2) identifying the alternatives; 3) predicting the consequences; 4) valuing the outcomes; and 5) making a choice. Each of these steps contains important questions and issues to be addressed by the policy analysts. For example, to establish the context of analysis, policy researchers must find out the underlying problem that must be dealt with, and the goals to be pursued in confronting the problem.

To lay out the alternative courses of action, analysts need to be knowledgeable about the particular policy and program and know how to obtain further information for analysis. It is also an opportunity for creative thinking so that alternatives may be designed to take advantage of additional information as it becomes available and the decision process becomes flexible, enabling decision makers to change the course of action as they learn more about the real world.

In predicting the consequences or estimating the likelihood of the alternatives, researchers rely heavily on the analytic techniques of management sciences, in particular economics, and operational research (e.g., forecasting and simulation, benefit–cost analysis, discounting, decision analysis, linear programming, critical path method, Markov models).

To value the predicted outcomes, analysts try to choose objective (often quantitative) standards or criteria against which policy choices can be evaluated. Since some alternatives will be superior with respect to certain goals and inferior with respect to others, evaluators need to decide how different combinations of valued goals are to be compared with one another. When valuation problems do not lend themselves easily to quantification, analysts may have to address the issue descriptively.

In selecting the alternative, analysts draw all aspects of the analysis together to identify the preferred course of action. Sometimes, the analysis is straightforward and the alternative that is best may be selected. At other time, the analysis may be so complex that researchers have to rely on a computer to keep track of all the options and their possible outcomes. In most situations, the choice among competing policy alternatives is never easy, for the future is always uncertain and the inescapable tradeoffs painful.

PROCESS

There are many ways to conduct health care evaluation. The following is a description of a six-step process to conduct evaluation.

Determine the Scope of Evaluation

To determine the scope of evaluation, first, the evaluator reviews all pertinent information about the evaluation assignment. Then, some background investigation is conducted to find out more about the nature of the assignment. Finally, the evaluator negotiates and reaches agreements with the sponsor about their mutual expectations of the evaluation assignment.

Get Acquainted with the Program

Once the contract has been signed, the evaluator officially proceeds with the evaluation. The first task is to get fully acquainted with the program you are going to evaluate. Specifically, you should find out about the program's goals and objectives, its principal activities, organizational arrangements, staffing, roles, and responsibilities, relationships between program operations and outcomes, profiles of the clients and services provided, financial performance, and its primary problem(s). In addition, some contextual information about the organization that administers the program may be useful. Such information includes organization's mission, history, services or products, characteristics of staff and clients, etc.

Often, your collaborators or evaluation coordinators are the best source of information and can provide you with materials containing the abovementioned information. Or they may suggest places you can obtain the information. Some common sources that the above information may be obtained include the program proposal written for the funding agency, the request for proposals (RFP) written by the sponsor or funding agency to which this program's proposal was a response, brochures of the program, program curricular or other materials, program implementation directives and requirements, administrative manuals, annual reports, an organizational chart or description of the administrative, decision-making, clinical, and service roles played by various people in the program, patient or client records, daily schedules of services and activities, the program's budget and actual spending reports, memos, meeting minutes, newspaper articles, document describing the program's history or the social context which it has been designed to fit, legislation, administrative regulations, completed evaluation studies, and perspectives and descriptions from

program managers, participants, sponsors, or users. If feasible, you may want to personally “scout” some or all of the program components and activities. At a minimum, you should conduct one site visit to obtain first-hand impressions of how programs actually operate.

The evaluator then directs attention to the goals, objectives, and outcomes of the program and their measurements. The goals and objectives specified for the program will be used as a benchmark. Program staff and planners will be consulted with to make sure these indeed are the goals and objectives of the program. They may be asked to write a clear rationale describing why the particular activities, processes, materials, and administrative arrangements in the program will lead to the goals and objectives specified for the program. Some adjustments may be necessary to add or delete some of the objectives. Reasons for the adjustments should be clearly documented. However, the program’s major goals may not be changed. The evaluator may look for additional sources for program goals and objectives. For example, are there written federal, state or local guidelines about program processes and goals to which this program must conform? What are the needs of the community or constituency which the program is intended to meet? Utilizing the above information, the evaluator can recreate a detailed description of the program, including statements identifying program goals and objectives, and cross-classifying them with program elements or components, comparing how the program is supposed to operate with how it actually operates.

Information about the outcomes of the program may be obtained from the program’s published documents, performance records, productivity indicators, patient or client data base, and cost data such as financial performance records, insurance claims records, workers’ compensation claims records. Often it may be necessary to conduct additional studies to find out more about the program and its performance. For example, participant and/or staff survey or interview may be conducted to obtain additional or supporting data to back up depiction of program events, operations and outcomes. Past evaluations of this or similar program, if available, will provide insight into how measurements can be constructed. Books and articles in the evaluation literature that describe the effects of programs such as the one in question are also valuable. If feasible, you may want to personally observe or monitor the program outcomes.

Finalize the Methodology for Evaluation

Although you should have considered the evaluation plan at the start, now that you have become

acquainted with the program, it is time to finalize the method(s) of evaluation. Specifically, you will decide the evaluation design, data instruments and measures, data collection methods, and data analysis techniques. You may consider involving the primary potential users in planning for the evaluation to facilitate their ownership of the study, and encourage trust and cooperation. As you plan for the evaluation activities, you should draw a detailed time schedule indicating when each activity will be performed by whom using what types of resources, and the duration of these activities. The schedule will be used to monitor the progress of the tasks so that the evaluation can be completed in a timely fashion.

Collect Data

Once the evaluation methodology has been finalized, the evaluator then proceeds to perform the tasks as scheduled. Much of the initial research will involve implementing the planned methodology including design, sampling, data collection and processing. Usually, there will be different kinds of data and different ways of collecting them. Data may be collected cross-sectionally or longitudinally. They may be collected from program staff and/or participants themselves. Staff survey might indicate that services have been delivered. Participants’ survey is valuable for a number of reasons. First, it provides evidence to corroborate the staff’s response. If not, different perspectives can be obtained. Second, securing participant data enables providers and program planners to know what is important to clients, including their satisfaction with and understanding of the intervention. Finally, it is an important way to find out not only whether services were delivered, but what was actually delivered, how they are perceived, and whether they are utilized as intended. Collecting a variety of information enables you to gain a thorough look at the program, and obtain more indicators of program effects.

The evaluator should make sure that the instruments are administered, interviews and observations conducted and coded, secondary data gathered and processed, and the scheduled deadlines met. If necessary, the evaluator should see to it that proper training has been given to those responsible for data collection (sending out questionnaires and monitoring their return, or conducting telephone or face-to-face interviews, observations, field work, etc.).

Analyze Data

Data analyses are conducted according to the techniques specified in the methodology section. The major objective is to find out the net outcome of the program,

i.e., whether or not a program produces desired levels of effects, reflected by the outcome measures, over and above what would have occurred either without the program or with an alternative program. Net outcome may be expressed as gross outcome subtracting effects from non-program-related, extraneous confounding factors and design effects. The net outcome may then be compared with that from other programs or some objective standards.

Report Findings

Evaluators have many ways to report the findings of their evaluation, including informal meetings with program and evaluation sponsors, memos, newsletters, formal presentations, formal written reports, and scholarly publications.^[5] To program sponsors, a formal written report perhaps is the most important product of evaluation and is required from the evaluator. To enhance their utility, valuation results should be presented in a way that non-researchers can easily understand. The evaluator may share any draft reports with the clients for review before turning in the final product.

CONCLUSION

In sum, assessment and evaluation of health care is the systematic application of scientific research methods for assessing the conceptualization, design, implementation, impact, and/or generalizability of health

services programs. Health care evaluation is technical, applied, and should be objective. The process to conduct evaluation consists of determining the scope of evaluation, getting acquainted with the program to evaluate, finalizing the methodology for evaluation, collecting data, analyzing data, and reporting findings. Health care evaluation is likely in high demand given the increase in publicly funded health care programs and the need to establish their efficacy for continued funding.

Health Policy in Singapore

M. Ramesh

Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore

INTRODUCTION

The *World Health Report 2000* ranked Singapore sixth overall in terms of health care quality, cost-effectiveness, and accessibility among the 192 countries evaluated. The interest in the island state's health policy that followed has generated a striking debate among analysts and practitioners in countries contemplating reform. While much of the discussion has focused on its financing arrangement, particularly the Individual Medical Savings Account, Singapore's system of providing health care is no less remarkable.

The objective of this entry is to describe the arrangements for providing and financing health care in Singapore and highlight relevant policy lessons. It will show that public provision of hospital care, combined with private financing, offers a viable reform alternative for other nations contemplating reform. The case is particularly compelling for public provisions because of the equity implications of private financing.

POLICY HISTORY

In the final years of colonial rule, the British established a reasonably well-developed health care system in which public and private care coexisted. In the 1950s, the colonial government became increasingly involved in the provision of inpatient care through public hospitals, partly reflecting the recently established National Health Service in Britain, through which hospital care was available to all without a means test.

The People's Action Party (PAP) government that took office in 1959 continued and expanded the arrangement. In addition, it massively expanded its commitment to promoting public health and hygiene, to the point that they were of First World standards by the 1970s. The large financial implications of publicly provided hospital care became increasingly apparent in the 1970s, as trends of population aging and epidemiological transition became apparent, prompting the government to search for alternative mechanisms for health care financing.

After briefly toying with the idea of establishing public health insurance, the government firmly rejected it in 1982 because of fears of third-party payment

would lead to over-supply by producers and over-use by consumers. The National Health Plan, announced in 1983, instead initiated a range of privatization measures designed to reduce the share of expenditures borne by the government and to encourage consumers to assume greater responsibility for their health care. At the same time, the government reiterated its commitment to providing heavily subsidized service to those who could not afford it.

The establishment of Medisave within the Central Provident Fund (CPF) in 1984 was the first in a series of measures aimed at reducing government involvement in the financing of health care. The scheme compulsorily covers the entire workforce, including the self-employed. It is a compulsory individual savings scheme that requires the working population to set aside a portion of their income for medical care. However, it cannot be used to pay for outpatient care, except for some specialist care, and there are limits on the amount that can be withdrawn each day and for each procedure. The exclusions and ceilings are intended to allow accumulation of funds to pay for expensive inpatient care when needed. For further information on the health system in Singapore, see Singapore, 2006.^[6]

In the same year that Medisave was established, the government announced a plan to grant greater autonomy to government hospitals in managing their operations. Operational autonomy was intended to lead to greater competition, which in turn was expected to lead to greater efficiency, lower costs, and higher standards.

In 1990, the government established a publicly managed, but voluntary, health insurance scheme called Medishield. It covers hospitalization expenses for surgery and outpatient treatment for specified catastrophic illnesses. Its establishment, despite the government's opposition to social insurance, was in response to the realization that most Medisave accounts did not have sufficient funds to pay for illnesses with expensive treatment costs. Medishield's premiums are kept low by imposing a large number of exclusions and a severe cost-sharing requirement to avoid the moral hazards associated with third-party payment schemes. The exclusion of the elderly (currently above 85 years), who need more health care, serves the same purpose.

The Health Review Committee's report of 1992, issued as a white paper the following year, supported expansion of the role of the private sector and greater competition among health care providers, both public and private. At the same time, it acknowledged, "Market forces alone will not suffice to hold down medical costs to the minimum The government has to intervene directly to structure and regulate the health system."^[5] It called for greater government involvement in controlling costs, managing the supply of doctors, and governing key operations of subsidized hospitals. In the following years, measures were taken to control: (1) the introduction of technology and specialist disciplines in government hospitals; (2) the imposition of price caps in public hospitals, excluding expensive treatment from public schemes; and (3) tightening the supply of doctors.^[2]

The realization that there was a segment of the population that could not afford even highly subsidized health care led the government to establish a public assistance scheme called Medifund in 1993. It serves as an endowment trust fund built on a S\$1 billion contribution from the government. To prevent dissipation of the fund, income from the fund is used only to pay the bills of those unable to afford hospital care. Under the scheme, patients in the lowest class wards at public hospitals and outpatients needing expensive services may apply for complete or partial waiver of their bills. To receive assistance, applicants need to pass a means test administered by the hospital.

PROVISION

The government is heavily involved in providing health care in Singapore and owns and operates over 80% of all hospital beds.

Public hospitals are nominally private firms, though they are owned entirely by a government-owned holding company. The hospitals and holding companies enjoy considerable operational autonomy. However, the government continues to play a vital role as a regulator, buyer, and, no less significantly, owner.

Public hospitals in Singapore offer a choice of different classes of ward accommodations, ranging from a one-bed room (Class A) to a dormitory with ten or more beds (Class C), at different prices. The different wards provide equivalent clinical services but different levels of comfort and physician choice. More significantly, patients in Class A wards pay the full cost, whereas charges in other classes range from 80% in Class B1 to 20% in Class C; the rest is subsidized by the government. Thus, the choice of ward class involves not only a choice of level of comfort but also the level of subsidy, because the two are linked. While there is no required means test for the subsidized

wards, it is expected that those who can afford better class wards will choose them in order to receive better nonclinical services.

The government provides only a quarter of outpatient care through polyclinics, and the rest is provided by the private sector. In addition to providing subsidized outpatient services, referral points exist for accessing subsidized specialist medical services. Through polyclinics, users pay a nominal charge at government clinics, and the elderly and students pay even less. The number of visits to government clinics, as a share of all visits, has declined since the early 1980s. However, these clinics serve as a price benchmark for private clinics and offer a viable alternative to those who may find private services unaffordable.

While Singapore's health care system is based on Western medical sciences, a significant portion of the population relies on traditional Chinese medicine and, increasingly, Indian Ayurvedic medicine. Such medicine serves to complement and supplement Western medicine rather than substitute for it. The government regulates this sector lightly, controlling only poisonous and dangerous substances.

FINANCING

Singapore has an elaborate financing system that consists of direct expenditure by the government, regulated private expenditure from Medisave and Medishield schemes, and out-of-pocket payments.

Table 1 shows that Singapore, and especially its government, spends little on health care in general. Despite comparable income levels, its national health care spending of US\$898 per capita and 4.3% of GDP is less than half of the Organisation for Economic Cooperation and Development (OECD) average. No less remarkable is that the government's share of the total is around one-half of the share in other high income countries.

The government's share of national health care expenditures is 30%. Remarkably, the government's share stood at 75% of the total in 1980, indicating a massive shift from public to private funding over the last two decades.^[4] Singapore's government spending on health care is only around 1% of its GDP, compared to an average 6% in OECD.

Government expenditures on health care include subsidy of public hospitals and outpatient clinics, capital expenditures of the Ministry of Health, and the cost of providing health care to state employees. Class C wards in public hospitals are the main vehicles for delivering subsidized health care to the general population. Patients pay only 20% of the cost of service in Class C wards, rising to 80% for Class B1 wards, and they pay the entire cost of Class A wards. Government subsidies

Table 1 Health care expenditures

	OECD		Singapore	
	1990	2002	1990	2002
GDP per capita, PPP (current international \$)	18,810	29,510	12,230	23,980
Total health expenditure per capita, current US\$	1,417	1,979	444	898
Total health care expenditure, % of GDP	7.1	8.5	3.3	4.3
Share of total which is public, %	61	59	30	30

World development indicators, 2005, <http://devdata.worldbank.org/wbquery/>.

on average form 60% of a hospitalization bill; the remaining 40%, on average, is recovered from patients.

Those unable to pay for lower classes and highly subsidized service in public hospitals may request a partial or total waiver, which was once funded from the government's general revenues, but is now funded indirectly through Medifund. In 2003, 18,000 Class B2/C patients received assistance totaling S\$19.2 million, or an average of S\$1,067 per person. The government also provides the bulk of public outpatient clinics' operating costs. Individual patients pay a modest sum for outpatient treatment, and the elderly and students pay even less.

Private health expenditures in Singapore take the form of indirect payment through Medisave or Medishield or directly out-of-pocket. Medisave requires a compulsory saving of 6%–8% of one's monthly income, depending on age, to be used for payments for the hospital care of the account holder and his or her immediate family, except siblings. In 2004, total Medisave balances amounted to S\$32.1 billion, or an average account balance of S\$17,321 per active member. The government claims that the average amount is sufficient for most people if they choose the lowest class ward for admission. Nevertheless, Medisave forms only 7% of total health expenditures, a figure that has remained largely constant despite the increase in average account balance.^[1]

Medishield premiums are modest for most people, but they can be substantial for the low-income, especially if they are also elderly. Premiums are small (S\$30–80) for those under the age of fifty, but then rise rapidly for those who are older. Despite the relaxation of conditions for claiming Medishield benefits, almost 50% of inpatient admissions do not rely on

it to pay for any portion of their hospitalization bill. The government estimates that, following changes introduced in 2005, Medishield pays for 70% of the average hospital bills for the lower class (previously only 40%).^[3]

OUTCOMES

Medicare, the compulsory savings scheme for medical expenses, covers two-thirds of the labor force; the excluded are, for the most part, foreign workers. Subscribers to Medishield, which is a public, but voluntary, health insurance scheme, account for just over one-half of the labor force, suggesting that more than one-half of the population is uncovered. Non-subscription to Medishield is particularly high among the elderly, the segment of the population who needs it most.

Targeting of subsidy, without administration of a costly means test, and extensive government involvement in the provision of health care has kept a lid on Singapore's health care costs. The government also plays a significant role in what doctors and hospitals charge for their service. The government has a plethora of arrangements in place to reduce costs at public hospitals.

Table 2 shows that Singapore has excellent health status compared to other wealthy countries.

Its infant mortality rate (IMR) is less than half the rate found in OECD, and its residents' average life expectancy is superior to the OECD average. Yet more remarkably, its IMR has declined and its life expectancy has increased much more rapidly than others in the OECD. Singapore's health system also performs

Table 2 Health status

	Infant mortality rate (deaths per 1000 registered live births)		Life expectancy at birth (years)	
	1970	2003	1970	2003
Singapore	19.7	2.9	68	79
OECD	22	5.8	71	78

World development indicators, 2005, <http://devdata.worldbank.org/wbquery/>; http://www.undp.org/hdr2003/indicator/indic_289.html.

very well when measured for Healthy Life Expectancy (HALE) at birth—67 years for men and 69 years for women—which ranks it significantly higher than the United States, the world's largest spender on health care.

The heavy reliance on private financing in Singapore is likely to have adversely affected equity and access, but no reliable information is available to confirm or deny the claim. This problem is likely to be especially severe for households whose health care needs are great but their income is higher than the very low income necessary to qualify for public assistance.

CONCLUSIONS

Singapore has an elaborate health care system consisting of a range of measures for providing and financing health care. The provision of inpatient care is dominated by the public sector, while outpatient care is dominated by the private sector. Financing for both inpatient and outpatient care is derived largely from private sources, though the government is intricately involved through its Medisave and Medishield schemes.

The fine health care status that Singapore has achieved at a rather modest cost reflects its systems of providing, as well as financing, health care. The dominance of inpatient care by public hospitals, who enjoy considerable operational autonomy while still under close government watch, allows the realization of the benefits of planning, as well as market competition.

While the health care financing arrangements have worked so far, their long-term viability remains a matter of concern. As the population ages, Singapore's

health care expenditures are projected to rise to levels similar to the OECD average by 2030. A clear need still exists for a more comprehensive risk-pooling arrangement, because households will be unable to carry the heavy financing burden expected under the current arrangements.^[1]

Home Rule

Dale Krane

*Department of Public Administration, University of Nebraska at Omaha,
Omaha, Nebraska, U.S.A.*

INTRODUCTION

Home rule refers to the authority of a local government to make and implement a policy decision without first obtaining specific permission from a superior tier of government. In the United States, home rule is defined legally as the authority of a local government to exercise those powers granted by the state legislature, except where the exercise of a power would violate state law or the state constitution. Embedded in the idea of home rule is an important aspect of democracy and citizen sovereignty—policy decisions affecting a locality ought to be made by the citizens and officials of the locality. Of course, cities, counties, and other forms of local government exist within a larger framework of state governments and are expected to accommodate their actions to the interests of other localities as well as the state government. This is especially the case when the effects of a local decision “spill over” into another jurisdiction. Home rule, therefore, is a critical dimension of state–local relations in the United States, and as such, varies among the 50 states in terms of the types and extent of discretionary authority available to local governments. In some states, local governments possess little or no autonomy from state government control, while in other states, local governments exercise a broad range of policy making in areas such as their structure, functions, finances, and administration. The result of this inter-state variation is that the capacity of local governments to act in ways desired by their residents or to solve problems in a manner congruent with local conditions depends directly on the degree of home rule possessed by local governments in a particular state.

CREATURES OF THE STATE

The U.S. Constitution, while it contains numerous specific statements on the relationship between the national government and state governments, is silent on the place of local governments in the federal framework. The absence of any constitutional language referring to local governments means that the position and powers of local governments have been left to decisions by the states. Instead of granting local

governments substantial authority and capacity, states have acted to make local governments legally inferior jurisdictions.

In contrast to the federal relationship between the national and state governments, American local governments exist and function as units of government under the hierarchical control of state government. A local government, be it a municipality, a county, a special district, or a public authority, may act only in areas and in ways specified by state government. American legal theory, at least since the late 1860s, has held that local governments are “the creatures of state government.” Any action or means not permitted by state government is prohibited. If any doubt exists as to which level of government has the authority to act, this doubt must be resolved in favor of the state government. Furthermore, the existence and continuation of a local government rests with state government.

This “creatures of the state” theory of local government authority was promulgated in a precedent-setting decision by the Iowa Supreme Court in 1868. In the case of the *City of Clinton v. Cedar Rapids and Missouri Railroad Company*, Judge John F. Dillon ruled that municipalities “owe their origin to, and derive their powers and rights wholly from the [state] legislature,” and, therefore, are “mere tenants at will of the legislature.” This decision became known as Dillon’s Rule, and after it was upheld by the U.S. Supreme Court in 1903 and again in 1923, it has served as the principal legal opinion governing state–local relations.^[1]

Since the promulgation of Dillon’s Rule, the legal interpretation of home rule has become relatively standardized around the country. While the idea of home rule implies vigorous local government autonomy and self-determination, generally, state courts have held that local governments have only as much freedom and authority to govern their own affairs as the state, through its constitution and statutory laws, chooses to give to local governments. Unfortunately, Dillon’s Rule “often is interpreted improperly by observers who conclude the Rule centralizes all exercisable authority in the state legislature and local governments possess very limited discretionary authority. What these observers fail to recognize is the fact that the state legislature is free to grant broad discretionary

powers to local governments and several have done so.”^[2] That many state governments have granted substantial discretionary authority to local governments is an important trend that flies in the face of prevailing legal theory. In fact, the over-time accretion of significant powers by local governments has altered and even negated Dillon’s Rule in many states. So, it is important not to view the legal position of local governments as exactly the same in all 50 states.

THE HOME RULE MOVEMENT

Dillon’s Rule settled the question of the balance of powers between state and local governments in favor of state government. Other reformers who believed in more independence for local governments argued for a different solution to the question of just what was the proper balance of state and local government authority. These reformers campaigned to enact state constitutional changes that would permit cities to write and amend their own charters. This reform strategy was known as the Home Rule Movement and originally sought to end the interference of local state legislative delegations in municipal affairs by creating municipal charters for local governments. Eventually, the Home Rule Movement became associated with the idea of broad grants of local government autonomy.

In the 1840s and 1850s, local delegates to state legislatures used their position to write statutes that permitted the local legislative delegation to interfere in municipal decisions. So-called “local privilege” legislation often led to battles between the city council and the local legislative delegation. This state–local conflict sometimes provoked the state legislature to transfer control of certain activities of municipal government (e.g., police protection) to state-appointed officials. These laws became known as “ripper laws.” Beginning in the 1850s, some states such as Ohio and Iowa acted to prohibit “local privilege” legislation and to grant a modest degree of home rule to cities. But the state courts followed the “creatures of the state” theory, so reformers had to push for constitutional changes that altered the state–local relationship.^[3]

After the Civil War, those who sought to provide cities with constitutional protections from state legislative abuse understood that it would be impossible to obtain grants of substantive powers to cities without also conferring on cities the power to write their own charters. When Missouri wrote its 1875 constitution, it included the first-ever state constitutional provision to permit the drafting of municipal charters. Several other states soon followed Missouri and gave positive grants of authority to municipalities via various forms of general enabling laws and the option for home rule

charters. By 1912, constitutional language in the 13 states shared the common feature of establishing home rule through the use of a locally drafted charter that was to be ratified by local voters or by the city council.^[4]

Advocates of home rule benefited from an association with the Progressive reformers who sprung up on the Great Plains after the Civil War. The Progressive Movement’s emphasis on business-like government became the vehicle for further efforts to reform government after World War I, and the home rule idea continued to spread. In the 1920s, “Good Government” associations such as the National Municipal League disseminated model constitutional provisions which included home rule ideas. By 1937, 21 states had adopted some form of home rule charter authority.

The Home Rule Movement in its campaign for municipal and county charters raised the crucial question of “where was the line between state and local powers to be drawn?” New York State in 1923 tried to answer this question with a constitutional amendment that included a long list of items regarded as “local,” and thus, would be under local government control. Other states also adopted this strategy to enumerate “local affairs,” because this approach was thought to clarify the line between state and local interests, and as a consequence, would reduce the number of lawsuits initiated after the adoption of a home rule charter. This enumeration of a local affairs solution to state–local relations suffered from the inflexibility of constitutions. Once the list of state versus local powers was written into the state constitution, it was difficult to amend. State courts soon faced numerous lawsuits over whether some activity such as public health, street repair, or liquor licenses was a matter of local or state affairs. Finding a clear line was frustrating, and many state supreme courts found it easier to continue to adhere to Dillon’s Rule.^[5]

The American Municipal Association, forerunner to the National League of Cities, hired Dean Fordham in 1952 to devise a new model of state–local relations. He proposed a plan in which a state legislature would permit municipalities to write a charter with a broad list of powers. This new charter would allow municipalities to supersede special state laws and many general laws applicable to municipal corporations. In its essence, the Fordham “devolution of powers” plan proposed a reversal of Dillon’s Rule. Instead of the position that municipalities may exercise only those powers explicitly granted to them, municipalities under Fordham’s plan could act unless explicitly prohibited by state law. This model of home rule authority is sometimes referred to as “legislative home rule.” Several states have adopted this model.^[6]

Home rule for county government also made progress after World War II. In 1945, Missouri made

home rule charters available to its largest counties, and Washington enacted county home rule in 1948. By the end of the 1960s, county home rule had been established in 15 states. By the mid-1990s, 37 states (of the 47 states with viable counties) provided for some form of county home rule.

THE COMPLEXITY OF HOME RULE

Most treatments of home rule discuss the topic from a legal perspective. Yet, home rule refers to the actual discretion local officials exercise over various dimensions of local government. Usually, the powers granted by states to municipal or county governments are placed in three main classes: 1) governmental powers, which include the authority to enact ordinances, levy taxes, and exercise police powers; 2) corporate powers, which include the ability to enter into contracts, buy and sell property, and sue as well as be sued; and 3) proprietary powers, which allow local governments to own and operate commercial enterprises such as a utility. Which of these three classes of powers is granted to which type of local government varies from state to state.^[7]

The history of the Home Rule Movement shows that proponents of more local government authority focused their efforts primarily on amending state constitutions in order to create charters, or lists of power and authority possessed by a local government. The earliest charters typically provided local residents with the opportunity to select their own form of government (e.g., mayor-council, council-manager, or commission form). While the first charters granted by state governments were limited to the structural features of local government, over time, home rule advocates convinced state legislatures to broaden the scope of municipal (and county) charters to include other dimensions of local government. As state legislatures found that “local affairs” consumed more and more legislative time, state legislatures increasingly assigned responsibility for designated policy areas to local governments or permitted local governments more discretion over certain public functions. Likewise, state legislatures, often responding to demands from local government officials, granted more authority over administrative and financial matters to local governments. In recent years, states have even granted significant new authority to allow local governments to pursue economic growth.

All of these changes in the scope and types of discretionary authority that local governments possess and exercise demonstrate that a legal perspective to home rule is a narrow view of home rule. Any portrayal of local government authority that continues to paint a picture of local governments as “creatures

of the state” ignores the changes that have occurred in the relationship between state and local governments since 1970. Just as state governments modernized their structures and administration, so too have they enhanced the authority of local governments to make choices across a wide range of important activities. The litmus test of local government autonomy is discretion over fiscal matters. While it is true that states have continued to impose certain constraints on local fiscal authority, primarily restrictions on the use of the property tax, it is also true that many states have diversified the types of revenue sources local governments may choose to tap. Furthermore, states have granted local governments more discretion in how they spend their resources. As long as a legal lens is used to study home rule, the description will miss the complexity of the state-local relationship, and thus, miss much of the actual behavior of local governments.^[8]

CURRENT STATUS OF HOME RULE

Despite the enlargement of local government discretion during the last half of the twentieth century, the actions of state legislatures have often been negated by state courts that have been reluctant to overturn Dillon’s Rule. Since 1970, however, several states have acted to redefine the scope of local government authority. Illinois, for example, modified the devolution-of-powers model by moving in the direction of the enumeration strategy that had been tried during the “good government” era. That is, the Illinois constitution set forth complex decision rules related to the establishment of home rule, the writing and adoption of charters, the specific areas of local affairs including powers to regulate health, safety, morals, and welfare, and powers to tax and incur debt. Equally important, the Illinois constitution went to the heart of Dillon’s Rule by telling state legislators and judges how to interpret the list of local powers—“the powers and functions of home rule units shall be construed liberally.” By contrast, non-home-rule units and limited purpose governments (e.g., special districts, townships) “shall have only powers granted by law.”^[9]

The Illinois approach is significant, because it established a new model of home rule—the “liberal construction” model. By sorting out the list of local powers and stating them in language that the state courts and the legislature had to follow, Illinois lawmakers specified the conditions under which the state government could preempt a local government charter. If the specified conditions did not exist or pertain, then the state government (legislature or courts) could not preempt actions taken by a local government. Other states copied the Illinois language in recent revisions of their constitutions. The Alaska constitution is

No Home Rule n = 9

Alabama, Connecticut, Idaho, Indiana, Nebraska,
Nevada, New Hampshire, Virginia, West Virginia

Constitutional Home Rule Charter n = 22

Arizona, Arkansas, Colorado, Florida, Georgia, Hawaii*,
Iowa, Kentucky, Maine, Maryland, Massachusetts, Minnesota,

Fig. 1 Municipal home rule, by type.

direct: "... a liberal construction shall be given to the powers of local government units ..." and "[a] home rule borough or city may exercise all legislative powers not prohibited by law or by charter." Amendments to constitutions in Colorado, Louisiana, Montana, and New Jersey also added similar language.^[9]

The usual classification of the home rule authority found in the 50 states identifies three distinct models of local government authority: 1) Dillon's Rule states where no home rule exists; 2) home rule charter states where cities and often counties may adopt a charter with specific powers; and 3) "devolution of powers" states where local governments may act unless something is specifically prohibited.^[10] A fourth model of "liberal construction" should be added to these three different distributions of authority between state and local governments. This fourth model would include states where constitutional language has been written so as to instruct the state courts to interpret broadly the authority of local governments.

A recent compilation of the status of home rule in the 50 states describes in detail the variation in local government discretionary authority.^[11] Fig. 1 classifies state governments by the type of home rule available to municipal governments. Only nine states currently restrict their municipalities to a narrow interpretation of Dillon's rule. In 22 states, the state constitution

provides for the drafting of home rule charters by municipal governments. Six states make home rule power available to municipalities via grants by the state legislature. Thirteen states have adopted some version of the "liberal construction" approach to home rule. Other than those states in the first category [no home rule], the other 41 states permit municipal governments to exercise various combinations of discretionary authority, most typically discretion over the form of local government and over functional responsibilities. About a dozen states also grant their municipalities some degree of fiscal discretion. The existence of this considerable degree of variation in the extent and types of authority available to local governments means that local governments in many states are no longer "creatures of the state," but rather, these local governments are increasingly becoming "partners of the state" in the provision and delivery of services to citizens.

Human Relations Management Theory

Gerald T. Gabris

*Division of Public Administration, Northern Illinois University,
DeKalb, Illinois, U.S.A.*

INTRODUCTION

Human relations management theory encompasses a rich and diverse tradition of models, techniques, research findings, and ideas that often trace their roots back to the Hawthorne Experiments conducted during the late 1920s. Researchers implementing experiments at the Hawthorne plant of Western Electric (in Cicero, IL) placed two groups of employees doing the same work into separate rooms. One group was treated as the control, and the second was exposed to various experimental stimuli such as increased lighting, decreased lighting, rest pauses, and so on. The researchers, F.J. Roethlisberger of Harvard and W.J. Dickson of Western Electric management, expected the experiments to lead to different levels of performance for the experimental group.

This thinking was in vogue for the day, where classical organization theory conceived the organizational system as a mechanism that could be manipulated or readjusted to affect employee performance. To the amazement of the researchers, both groups increased their performance. Subsequent analysis of these unexpected results led Roethlisberger and Dickson to conclude that the experimental design was problematic, which allowed extraneous factors to enter the design that led to these unanticipated results.^[1]

What happened was that employees in the control and experimental groups were treated as special. They were given attention by management, separated from other employees, and encouraged to perform. The fundamental lesson that emerged from this early research suggested that employees who are given attention by management, who are treated as special, and who perceive their work as significant can become highly motivated and thus become more productive. While this insight today may seem rather commonsensical, back then, it was novel. Employees were not conceived as special but rather as expendable cogs in a machine who either performed their work or were terminated. The need to motivate employees to perform better was not part of the managerial equation at this point in time.

Needless to say, the results of the Hawthorne Experiments, once the reasons for them were better understood by managers and academicians, served as

a springboard for a panoply of new theories and approaches to management. This new way of thinking that gained impetus in the 1930s and 1940s can be broadly labeled “human relations management.” Subsequent research and theory development in the 1950s and 1960s provided further conceptual grounding to this management school of thought to a point where today, using human relations techniques and models is considered an almost taken-for-granted skill that effective managers have mastered. This essay will provide a brief snapshot of the kinds of human relations theories that have emerged over the years by discussing their commonalities and areas of difference. But first, we will endeavor to define this rather broad approach to management by identifying its core values.

HUMAN RELATIONS MANAGEMENT DEFINED

In fairness, there is no simple, all-encompassing definition for the human relations school of thought. Nonetheless, there are certain values and themes that tend to permeate the theories, techniques, and models connected with this way of thinking. These can be stated as follows.

Human relations management acknowledges the centrality of the employee as one of the important and, indeed, perhaps most important strategic factors within the organization.^[2] Here, it is management’s responsibility to treat employees with respect, dignity, and value in order to motivate and develop the full performance potential of employees. Often, but not always, this involves utilizing employees in decision making, expanding job responsibilities, delegating authority, and increasing employee autonomy, all aimed at maximizing an employee’s perception of self-worth. In other words, by striving to satisfy the higher psychological needs of their employees, organizations find that employees exhibit better performance and commitment to organizational goals and needs. Both win. On balance, employees are considered mature, self-directed individuals who will perform high-quality work if given the chance. Supervisors are expected to avoid rigid and overbearing invasive control methods

and to rely more on coaching, mentoring, and participative styles.

This broad description of human relations management incorporates elements of many different models and theories. All tend to support and affirm the concepts highlighted above. At this point, we will briefly consider several seminal contributions to human relations theory and how these ideas have become part of the day-to-day vernacular of public administration.

THE OHIO STATE UNIVERSITY STUDIES

In the 1950s, researchers at Ohio State were striving to finding a balance between tasks and relationships insofar as to how managers dealt with their subordinates. Much of this was based on the Leader Behavior Description Questionnaire (LBDQ).^[3] Later, Stogdill^[4] condensed this work into the concepts of “initiating structure” and “consideration.” The importance of this research involves its emphasis on structure and human relationships that effective managers need to master. Managers who solely stress structure, tasks, and production will not be as effective as managers who also strive to motivate employees by appealing to their human needs and emotions. What the Ohio State research was finding, was that the most effective managers blended and balanced an emphasis on task structure with consideration of the human needs of their subordinates. In short, effective managers needed to appeal to the higher psychological needs of employees.

Although now considered passé, the work of Abraham Maslow^[5] provided perspective on this point. Maslow’s “hierarchy of needs” made the case that what really motivates people the most is not basic, extrinsic, physical needs, but instead, higher psychological needs such as esteem and actualization. These are intrinsic. Managers should keep this in mind when trying to motivate employees. Strategies that only emphasize physical and extrinsic factors may satisfy basic needs for a short while but will not likely cultivate deeper motivational drives that keep employees going when they are not closely supervised.

DOUGLAS MCGREGOR’S THEORY X AND THEORY Y

Douglas McGregor’s *The Human Side of Enterprise* captured, perhaps better than most “human relations theories,” the basic core of this particular notion.^[6] This model dichotomized management style into two basic strategies called “theory X” and “theory Y.” This simple duality builds on Maslowian motivation theory and points out that if given the chance, most

employees will become reasonably productive because they want to, not because they are forced to.

Theory X assumes employees are only motivated by basic needs and, consequently, have relatively little motivation to grow and mature in their work environment. Theory X suggests that most employees are naturally lazy, docile, indolent, and incapable of performing complex tasks without direct supervision. Thus, supervisors need to utilize a variety of “control” techniques to keep employees in line so they have little option other than to comply with managerially determined objectives.

Theory Y provides an alternative model based on quite different assumptions. Here, employees are understood to be motivated by higher psychological needs. Employees want to grow, to be given challenging tasks, and to take on new responsibilities. By providing a work environment that enables employees to meet these higher needs, the organization not only satisfies the goals of the employee but also motivates the employee to a higher level of performance in achieving organizational objectives. Theory Y suggests that most employees want to work hard, and want to experience challenging jobs, but all too often, are treated like children and thus conform to the lower expectations placed upon them. Based on these concepts, McGregor concluded that by humanizing management, we create better employees and better organizations. This is the normatively correct path to follow.

BLAKE AND MOUTON: THE MANAGERIAL GRID

A somewhat related yet conceptually distinct theory developed by Robert Blake and Jane Mouton is referred to as the “managerial grid.”^[7] These authors provided a more practical application of the Ohio State Studies’ concepts of “initiating structure” and “consideration.” The managerial grid consists of two simple axes. The vertical axis measures “concern for people,” while the horizontal axis measures “concern for results.” A nine-point scale measures each axis, creating a grid.

Blake and Mouton then labeled specific grid intersects with benchmark descriptors to facilitate how a person’s score on their leadership questionnaire could be interpreted. For example, managers who have a high concern for results but a low concern for people (1, 9) are labeled “authority compliance” managers. Those concerned with people and not interested in results (9, 1) are called “country club” managers. The best managers in all situations are those who evidence a simultaneous concern for people and results (9, 9), and they are referred to as “team” managers.

This is the kind of management system to which all organizations should aspire.

RENSIS LIKERT AND THE HUMAN ORGANIZATION

Rensis Likert, a researcher at the University of Michigan, wrote a book in 1961 that further expanded our knowledge of human relations in organizations.^[8] As a survey researcher, Likert surveyed large numbers of employees in many different organizational settings. He is the developer of the “profile of organizational characteristics” survey questionnaire that serves as the basis for his theory and data.

Based on expansive data, Likert divided organizations into four systems. These were as follows:^[9]

System 1—Exploitative authoritarian.

System 2—Benevolent authoritarian.

System 3—Consultative.

System 4—Participative group.

Each system is composed of several factors, such as motivation techniques, supervisory style, incentive systems, and so on. Likert referred to these as managerial systems, because how an organization scores on one factor is predictive of how they score on other factors. Hence, organizational factors are interrelated parts. What Likert found was that most organizations score somewhere between systems 1 and 2 on average, but that when asked where they would like to be, most organizations respond systems 3 or 4. Thus, he infers that system 4, participative group, must be normatively the best, because that is where employees want to be if they can, almost all of the time.

In a vein similar to McGregor and Blake and Mouton, Likert made a strong case that humanizing the organization by increasing participation, expanding communications, appealing to higher psychological needs, and increasing responsibility contributes to the responsible freedom of employees and, therefore, should stimulate higher performance. As a consequence, organizations may wish to incorporate human relations management philosophy into their repertoire, not simply out of altruism but out of self-interest.

CONTINGENCY MANAGEMENT THEORY: HERSEY AND BLANCHARD

This essay will provide one final twist on the human relations perspective. Some scholars suggest that style of management is contingent on the situation, and that

perhaps there is no one best way to manage all of the time. Paul Hersey and Ken Blanchard^[10] utilized the same axis descriptors as Blake and Mouton, but they came to quite different conclusions. Their vertical axis is labeled “relationship” behavior, and the horizontal axis is labeled “task” behavior. How one scores on their Leadership Effectiveness Adaptiveness Description (LEAD) survey determined where one would be placed on their grid.

Hersey and Blanchard suggested that in some cases, employees are immature or ignorant on how to perform certain tasks. Here, participation makes little sense. Supervisors should simply tell the employees what to do. They call this S1 or “telling” management. Sometimes, employees may not know how to perform a task, but there is a need for them to work together cooperatively. Here, an S2 or “selling” style of management would be better. Alternatively, employees may know how to perform a task or have high task maturity, but they need to build relationships to work cooperatively on a project. In this case, an S3 or “participative” style might work best. Finally, if employees know how to perform a task, and they do not need to work with others to get it done, then a supervisor should use an S4 style or simply “delegate” the work.

The point is that Hersey and Blanchard realized that supervisory style and approach are somewhat contingent on conditions at work. They felt that a human relations approach may be useful at times but not necessarily in all situations. This approach represents a more sophisticated approach to understanding how human relations theory might be utilized in public organizations. It is a tool, an approach that encourages more flexibility and adaptativeness, in contrast to the earlier models discussed.

CONCLUSION

Human relations management is alive and well today. We probably take it for granted in most of the organizations we work in and for. Bosses today who exude little regard for people are typically considered old-fashioned autocrats who, due to insecurity, strive to bully people around. It is not surprising that in research conducted by Jay Hall^[11] that asked employees to rate their favorite supervisor and to specify their behavioral traits, those who received the highest “management achievement quotients” or MAQs (one’s hierarchical rank divided by chronological age) were those who practiced human relations management. Human relations management has become an ingrained assumption about how we should manage public organizations. While it may at times be difficult to define, you can tell it when you see it.

Human Resource Management

Stephen E. Condrey

Ilka M. Decker

Carl L. McCoy

Carl Vinson Institute of Government, University of Georgia, Athens, Georgia, U.S.A.

INTRODUCTION

The field of public human resource management has endured a tumultuous yet challenging decade, with the emergence of reforms such as outsourcing, privatization, decentralization, reinventing government, new public management, and the like. At the center of these reform activities has been the call for human resource management to become a relevant and viable partner in the actual management of public organizations.

In a sense, human resource management is always in a state of reform; competing values such as responsiveness, economy, efficiency, and social equity play an important role in shaping the field. Lynn and Klingner noted that as the profession has evolved, so too has the role of the human resource manager:

(H)istorical traditions emphasize the technical side of personnel management, with less emphasis on policy-related analytical work, relationships with outside organizations, and decision making among conflicting values... A more contemporary view emphasizes different activities and relationships... For example, the modern personnel director might be called upon to prepare cost-benefit analyses of alternative pay and benefit proposals related to collective bargaining with employees in the solid waste department. At the same time, he or she might also be asked to evaluate the cooperative feasibility, productivity, and cost of privatizing or contracting the entire function out, thus making the collective bargaining analysis obsolete.^[1]

Human resource managers must adapt to these changes in the profession, all the while implementing effective and responsive human resource management systems in their organizations. In *Human Resource Management in Public Service*, Berman et al. defined human resource management as “a titanic force that shapes the conditions in which people find themselves... From deciding how individuals will be recruited to how they are then compensated, trained, and evaluated, human resource administration has a significant, even definitive, effect on the careers of all employees.”^[2]

OVERVIEW

Human resource management affects individual employees and their internal calculus as to whether and to what extent they will contribute toward organizational goals. Collectively, the system of human resource management present within an organization will positively or negatively affect the internal functioning of the organization and, ultimately, the quality of services it delivers to its clients (citizens).

This article is divided into two sections. The first section briefly discusses significant elements of an effective system of human resource administration. The second section provides a listing of reference sources in the field.

DESIGNING AN EFFECTIVE HUMAN RESOURCE SYSTEM

What makes an effective system of human resource management? While there is no simple answer to this question, it is nonetheless a critical issue to be explored. Indeed, an effective system of human resource management can enhance every area of administrative operations. Likewise, an ineffective or nonresponsive human resource management system can hinder administrative performance and have debilitating effects on an organization's climate, its performance, and its ability to attract and retain a quality workforce.

The following eight elements can be combined to help develop an effective public human resource management system:

- Systematic and meaningful employee involvement.
- Competitive compensation and benefits system.
- Responsive position classification system.
- Professional human resource management staff.
- Political and bureaucratic support.
- Integral part of the organization's management infrastructure.
- Aggressive employee recruitment and professional selection techniques.
- Effective and systematic training and development activities.

While this is a nonexhaustive listing, it begins to bring substance to the concept of an effective human resource management system. Following is a brief discussion of each of these elements.

Systematic and meaningful employee involvement in human resource decisions and processes can build the trust and support necessary for employee buy-in concerning organizational mission and goals. Additionally, a competitive compensation and benefits system will help attract and retain a quality workforce. An effective compensation system is predicated upon a flexible and responsive system of job classification. The classification system should assure “equal pay for equal work,” while also providing mechanisms to

recognize professional growth and development through the use of career ladders or broadbanding.

Necessary to any effective human resource management system is professional staff devoted individually or collectively to various aspects of the personnel system. Additionally, the organization’s political and bureaucratic leadership must be committed to a professional human resource management system and allow adequate funding for its development and maintenance. As a corollary, human resources should be viewed as an integral part of the organization’s management infrastructure. This entails the human resource management staff having input into important general management concerns. Because three-quarters

United States Equal Employment Opportunity Commission	www.eeoc.gov

of most public organization's budgets are personnel related, it makes good managerial sense to involve the human resource staff in managerial decisions.

An aggressive system of recruitment and selection can help an organization recruit quality employees into the organization. Coupled with professional selection techniques such as assessment centers, an effective recruitment and selection program can build and strengthen an organization. Finally, effective and systematic training and development activities can further enhance organizational capacity.

DISCUSSION

Taken individually, each of the areas discussed above will not result in an outstanding human resource management department or function. Collectively, however, they signal a human resource department that is attuned to the needs of the organization's employees, its management purpose, and the citizens it serves. Building an effective human resource management system cannot be accomplished overnight; it requires internal competence and external support. As such, it is necessarily an incremental process, whereby major actors in the organization (governing body, management, and employees) gain confidence and respect in the human resource department and its ability to facilitate an effective and responsive system of personnel management. Those seeking an effective human resource system should not look to the latest management fad or quick fix, but rather concentrate on the proper resources (monetary and human) and buy-in of the organization's major stakeholders.

SOURCES AND RESOURCES

Table 1 lists various resources for those interested in further information concerning human resource management. The table lists useful texts, readers, handbooks, journals, and websites. While not exhaustive, this listing provides a sound starting point for discovering further information about public human resource management.

CONCLUSIONS

This article has provided a brief introduction to the challenging and evolving field of human resource management in public organizations. It is hoped that the reader will refer to the reference sources herein as a roadmap for further study in the field.

Human Resource Management for Productivity

Seok-Hwan Lee

*Department of Public Administration, Catholic University of Korea,
Puchon City, Republic of Korea*

INTRODUCTION

Human resource management for productivity refers to a comprehensive strategy that is designed to achieve productivity improvement by managing human resources in public organizations. Although productivity improvement in the public sector is also comprehensive both in concept and scope, it is possible to define productivity improvement in human resource management. From a perspective of effective human resource management, productivity is defined as the production of a series of efforts that encourage public employees to work hard in an efficient manner.

In addition, because productivity improvement is affected by various factors, ranging from top management support to feedback and correction on budget management decisions, productive human resource management requires human resource managers to pay special attention to four major elements in an open system perspective.

SELECTION AND COOPERATION AMONG RELATED AGENCIES: RIGHT PEOPLE, RIGHT TIME, AND RIGHT PLACE

Productive human resource management must start with recruiting the best and brightest. Because certain negative images (for example, corruption, red tape, and buffoonery) about public services and adverse circumstances prevail among citizens, attracting highly qualified people into the public sector may be harder than into the private sector. However, streamlined and flexible selection procedures can provide effective tools to hire highly talented people at the right time and at the right place.

Structured Application Forms

A structured application form that is focused on specific selection criteria and competencies provides an agency with a major head start in the short-listing stage of the recruitment process. Application forms must be tailored to a specific competency model that reflects agencies' professional needs.

Effective Cooperative Systems Among Related Agencies

So often, ineffective cooperation systems among related agencies hinder hiring agencies from carrying out their recruitment plan. Given that productive human resource management must be focused on the premise of "right people, right time, and right places," a lack of effective cooperation and the failure to eliminate unnecessary involvement by related agencies will delay the process and cause hiring agencies to lose the opportunity of having highly qualified and talented people in the competitive market.

Effective cooperation can benefit from using Internet technology that enables related agencies to communicate important information in a timely manner. Internet technology can certainly make a streamlined recruitment process possible by cutting time and costs, as well as raising an agency's ability to locate and identify qualified people in the market.

Continuous Recruitment Process

Flexibility in recruitment is essential to attract viable candidates from the limited pool. Furthermore, diversification of public employees will also be facilitated by continuous recruitment. Whenever there is a job vacancy, an agency should be able to hire the right people immediately. The longer the gap between vacancy and replacement, the more likely an agency is to lose competitiveness.

In an effective continuous recruitment process, hiring department managers will submit a "request to recruit" to the human resource department and develop a written rationale that the availability of qualified candidates is limited. The approval notice must be made as soon as possible.

Professional Needs and Process Needs: Shared Responsibility

A streamlined and flexible recruitment process also encourages greater strategic use of the agencies' people, as well as a better balance between the professional needs of employees and the process needs of

the agencies.^[1] When there is a need for human resources, the recruitment process requires both the human resource department and related departments to work together. The reason is that working together not only helps to identify whose qualification would most fit a specific department's need, but it also facilitates budgetary approvals to create the position in a timely manner.

In addition, although the human resource department is in charge of the whole recruitment process, it is also important to have related department managers involved in the process. Department managers can assist the recruitment effort through disseminating letters or announcements to colleagues in the field and soliciting similar assistance from current employees to attract the best-qualified people.^[2] Therefore, shared responsibility among departments is a necessary first step for a streamlined recruitment process.

NEED FOR CONTINUOUS EDUCATION AND TRAINING

Productivity also depends on those who have appropriate knowledge, skills, and abilities (KSAs). As missions and environments change, KSAs become outdated. Therefore, organizations must continually renew their human resources.^[3] Training is critical to improving performance and reduces the likelihood of employee obsolescence in a changing environment. Staff training and development efforts are important to achieving manpower plans, as well as to improving competencies of individuals. Successful continuous training and development programs that require all members to actively participate typically include providing:

- An opportunity for employees to meet on a regular basis, thus enhancing team spirit.
- A forum for discussion of problems encountered on the job.
- A means of continuous reinforcement of the core mission of the organization.
- Valuable information for use on the job.
- Necessary tools and feedback for personal development.

IDENTIFYING MULTIPLE MOTIVATIONAL BASES

Perhaps, motivating employees to work hard is the most important job of human resource managers. Because productive organizations depend heavily on productive workforces, it is essential to identify employees' motivational bases and encourage them to work at their peak. Among other motivational bases,

organizational commitment has been said to be the key to enhancing productivity in any organization. The importance of employee commitment is found in its relationship to performance and productivity. Much of the literature on organizational commitment finds that commitment to organization is positively associated with job satisfaction, motivation, and attendance, and negatively related to such outcomes as job performance, absenteeism, and turnover.^[4,5] It should be noted, however, that employees could also be differentially committed to occupations, top management, supervisors, co-workers, and customers.^[6,7]

Among other foci of commitment, commitment to a supervisor is an important motivational base for increasing individual performance. Because extrinsic rewards controlled by one's supervisor are a major means for directing and reinforcing managerial and executive behavior,^[8] those committed to their supervisor are likely to be motivated to improving productivity. It is also possible to expect that where a teamwork-based organizational culture prevails, people are likely to be committed to their work group, thereby increasing their willingness for group-based performance. Therefore, human resource managers should realize that employees' motivational bases are different from individual to individual. This indicates that simply focusing on how to enhance organizational commitment (commitment to organization) may not guarantee a high level of individual performance and productivity.

Productivity improvement so often requires innovative behaviors among employees. Existing literature points out that innovation in the public sector is a function of strong leadership, openness, freedom, and public service spirit. However, because innovation often requires risk-taking behaviors among employees, many public employees are not inclined to suggest innovative ideas, even if they have some ideas that may help to improve productivity in the workplace. From such a point of view, this study assumes that employee trust, along with employee commitment, is the key to encouraging innovative behaviors among employees.

On a general level, employee trust is defined as an expectancy of positive outcomes that one can receive based on the expected action of another party in an interaction characterized by uncertainty. In the meantime, employee commitment is defined as employees' psychological attachments to their workplaces. It has also been said that the level of trust increases that of employee commitment. Therefore, to encourage innovative behaviors among employees, it is essential to have a high level of trust, thereby increasing the level of commitment.

This study argues that previous research has mainly centered on a unidimensional approach to both

employee trust (organizational trust) and employee commitment (organizational commitment), and that distinguishing among different dimensions of trust and commitment will help to explain variations in innovative behaviors above and beyond those that are explained by both organizational trust and organizational commitment. In this regard, this study proposes that both employee trust and commitment are multidimensional constructs.

As for employee trust, employees can differentially trust their supervisor, their co-workers, and their organization. Each dimension of trust also has three subdimensions: competency trust, work-related trust, and family-related trust. With reference to employee commitment, employees can also be differentially committed to their supervisor, co-workers, and organization.

ORGANIZATIONAL JUSTICE

Productive human resource management should be able to deal with various issues associated with workplace and personal life. It is the employers' responsibility to maintain a working environment free from discriminatory harassment. Any form of unlawful discrimination, including harassment based on race, color, religion, gender, national origin, age, disability, or any other characteristic protected by applicable law, is strictly prohibited.

Employee Assistance Program

Crises in employees' personal lives obviously affect their performance at work. When organizations help employees to overcome these problems, they can improve employee morale and loyalty and avoid incurring costs to the organization.^[1] The Employee Assistance Program (EAP) can help employees with the challenges of balancing work and personal life. The EAP is designed to provide easy access and assistance with resolution for a wide variety of personal issues, such as alcohol and drug abuse, financial counseling, and domestic and workplace violence. The EAP directors must be able to coordinate the EAPs offered by the organization or by contract providers, as a response to personal employee problems that become workplace issues.^[3] An effective EAP requires easy access to professional, confidential service 24 hours per day, 7 days per week, on either phones or Internet sites.

Due Process

The Fifth and Fourteenth Amendments to the Constitution ensure that the state and national government

cannot deprive individuals of life, liberty, or property, except by established judicial procedure. These due process clauses provide the people with several means for the procedural protection of their fundamental rights from arbitrary administrative action. Its ultimate goal is to secure the fairness in a feasible and reasonable way.

Due process in the legislative rule-making setting probably requires a fair-minded administrative official and adequate advance notice of the content of the rule to permit compliance. However, the agency that chooses to develop its substantive policies through case-by-case adjudication must conduct itself, in each case, so as not to violate the applicable procedural due process requirement that courts have defined for varying adjudicative situations.

In this regard, the adjudicative action does require the due process, such as a hearing, because:

1. The government action is not general and affects a relatively small number of persons.
2. The immediate effect on the class is significant and direct.
3. The government action is directed at specific person.

In the meantime, legislative action does not require due process. The characteristics are as follows:

1. The government action is general and affects equally all persons within the class.
2. Immediate effect on the class is significant but indirect.
3. The government action is not directed at a specific person.
4. The government action is "general determination dealing only with the principle" on which all assessments are based.

CONCLUSION

From an open system perspective, productivity improvement requires comprehensive efforts, ranging from internal top management support to feedback from citizens. Among others, effective utilizations of human resources are crucial for productivity improvement.

An organization without human commitment is like a person without a soul: skeleton, flesh, and blood may be able to consume and to exert, but there is no life force. Government desperately needs life force.^[9] Thus, recognizing and responding to emergent human resource management demands is directly connected to improving productivity in public organizations.

Productive organizations are humane and show genuine concern for meeting employees' needs.

Productive human resource management in the twenty-first century is the management that focuses on balancing both employees' and the organization's needs.

Human Resource Planning

Joan E. Pynes

Department of Government and International Affairs, University of South Florida,
Tampa, Florida, U.S.A.

INTRODUCTION

Human resource planning (HRP) provides agencies with realistic information on the capabilities and talents of their current staff, as well as what knowledge, skills, abilities, and other characteristics (KSAOCs) will be needed by the organization in the future. Agencies with information that enables them to quickly adapt to changes can be provided by HRP.

Over 46% of local government employees are 45 years or older, while 30% of state government employees nationwide are eligible for retirement in 2006, and by 2008 more than 50% of federal employees will be eligible for retirement.^[1] Montgomery County, VA estimates that 50% of its senior managers will be eligible for retirement in 2010. By 2007, more than 70% of Fairfax, VA's top officials will be able to leave and collect benefits.^[2]

HRP refers to the implementation of human resource activities, policies, and practices to make the necessary ongoing changes to support or improve the agency's operational and strategic objectives. Agency leaders need to understand how their workplaces will be affected by impending changes and prepare for the changes accordingly. Agency objectives should be formulated after relevant data on the quantity and potential of available human resources have been reviewed. Are there human resources available for short- and long-term objectives? To be competitive, organizations must be able to anticipate, influence, and manage the forces that impact their ability to remain effective. In the service sector, this means that they must be able to manage their human resource capabilities. All too often agencies have relied on short-term service requirements to direct their human resource management (HRM) practices. Little thought is often given to long-term implications. By invoking HRP, agencies are better able to match their human resource requirements with the demands of the external environment and the needs of the organization. The human resource focus is not just an individual employee issue; it also focuses on integrating human resources into the organization's strategy. It becomes part of the visionary process. Strategic planning, budgeting, and HRP are linked together.^[3]

HUMAN RESOURCE PLANNING

In *The Case for Transforming Public-Sector HRM*, the National Academy of Public Administration identified five steps that were imperative in aligning human resource management to an agency's mission.^[4]

Step 1: Include human resource in strategic plans: HRM strategies needed to address agency goals must be discussed; and the resources needed to implement those strategies must be identified.

Step 2: Define human resource requirements: Workforce planning requires line managers and HRM experts working as partners to identify gaps that exist in the current workforce when compared to future requirements. A workforce planning system must be in place that enables the agency to understand the competency gaps to be addressed so that the agency can achieve its strategic goals. The assessment process will typically include documenting workforce demographics; calculating the current and projected attrition rates for key occupations; assessing the efficacy of primary sources of labor supply in both qualitative and quantitative terms; developing strategies for building the human capital needed to successfully achieve future mission goals; and evaluating progress, making mid-course corrections, and fixing accountability for achieving the desired outcomes.

Step 3: Develop action plan for implementing human resource strategies: An action plan should establish accountability for implementing the plan and identify the resources needed to complete the plan. The plan should also provide solutions to close any competency gaps that have been identified. To what extent is the agency able to attract and retain the expertise it needs to accomplish its strategic goals? Does the agency have the right people to meet mission and strategic goals?

Step 4: Evaluate progress: It is important to determine progress, make mid-course corrections, and assign accountability for achieving the desired outcomes. An evaluation provides a regular flow of information about how well HRM strategies are working. Information should be provided on a regular basis so informed decisions can be made about an agency's staff. Information about recruitment, retention, morale, and training and development should be analyzed.

Step 5: Manage the change process: Top management and human resource professionals' work together to develop a successful change process. Top management identifies the desired change, the reason for change, the expected benefits of the change, and the impact the change will have on employees. The leadership of the agency provides the necessary resources and allows time for the changes to occur, but holds staff accountable for performance.

In an effort to be proactive, the U.S. General Accounting Office developed *Human Capital: A Guide for Assessing Strategic Training and Development Efforts in the Federal Government*.^[5] During the planning and analysis stage, agencies review the following questions: 1) Does the agency have training goals and related performance measures that are consistent with its overall mission, goals, and culture? 2) To what extent do the agency's strategic and annual performance planning processes incorporate human capital professionals in partnership with agency leadership and other stakeholders in addressing agency priorities, including training and development efforts? 3) How does the agency determine the skills and competencies its workforce needs to achieve current, emerging, and future agency goals and missions and identify gaps, including those that training and development strategies can help address? 4) How does the agency identify the appropriate level of investment to provide for training and development efforts and prioritize funding so that the most important training needs are addressed first?

HRP is the process of analyzing and identifying the need for and availability of human resources to meet the organization's objectives. Forecasting is used to assess past trends, evaluate the present situation, and project future events. Forecasting and planning complement each other as forecasts identify expectations, while plans establish concrete goals and objectives. Forecasting has become increasingly important as a large segment of the public work force is inching toward retirement.

Agencies must consider how to allocate people to jobs over long periods. Attempts must be made to anticipate expansions or reductions in programs or other changes that may affect the organization. Based on these analyses, plans can be made for the recruitment and selection of new employees, the shifting of employees to different programs or units, or the retraining of incumbent employees.

A *demand forecast* anticipates the workforce that will be needed to accomplish future functional requirements and carry out the mission of the organization. In this step a visionary staffing assessment against future functional requirements is conducted. The result is a forecast of the type of competencies, numbers, and locations of employees needed in the future. An important part of the demand forecast is examining not only

what work the agency will do in the future, but also how that work will be performed. Some things to consider include:

- How will jobs and workload change as a result of technological advancements, economic, social and political conditions?
- What are the consequences or results of these changes?
- What will be the reporting relationships?
- How will divisions, work units, and jobs be designed?
- How will work flow into each part of the organization? What will be done with it?

Once the above questions have been answered, the next step is to identify the competencies employees will need to carry out that work. The set of competencies provides management and staff with a common understanding of the skills and behaviors that are important to the agency. Competencies play a key role in decisions on recruiting, employee development, personal development, and performance management.

Forecasting human resource requirements involves determining the number and types of employees needed by skill level. First, agencies need to audit the skills of incumbent employees and determine their capabilities and weaknesses. Positions must also be audited. In most organizations there are likely to be jobs that are vulnerable, that technology or re-engineering are ready to replace. Job analyses must be conducted to provide information on existing jobs. The basic requirements of a job should be defined and converted to job specifications that specify the minimum KSAOCs necessary for effective performance. The skill requirements of positions do change so any changes that occur must be monitored and reflected in the job specifications. It is not enough to monitor changes in positions. Organizations must also keep abreast of the skills that their employees possess. It (HRP) uses data inventories to integrate the planning and utilization functions. Data inventories compile summary information, such as the characteristics of employees, the distribution of employees by position, employees' performance, and career objectives. Specific data that are typically catalogued are age, education, career path, current work skills, work experience, aspirations, performance evaluations, years with the organization, and jobs for which one is qualified. Expected vacancies due to retirement, promotion, transfer, sick leave, relocation, or termination are also tracked. Using a computerized human resource information system to compile these data makes the retrieval of information readily available for forecasting work force needs.

When forecasting the availability of human resources, agencies need to consider both the internal

and the external supply of qualified candidates. The internal supply of candidates is influenced by training and development, and by transfer, promotion, and retirement policies. Assessing incumbent staff competencies is critical. Agencies should undertake an assessment of employees' competency levels. This will provide information for determining the number of those available and capable of fulfilling future functional requirements. It will provide salient information as to what recruitment, training, and other strategies need to be deployed to address workforce gaps and surpluses. The County of Los Angeles Department of Human Resources has developed a Strategic Workforce Planning Guidebook.^[6] The Guidebook is intended to provide departments with a common definition of Strategic Workforce Planning as it relates to the County's Strategic Plan; a case study to illustrate an actual Strategic Workforce Plan; a framework for departments to conduct a four-part needs assessment of current and future requirements; and developments of their department and a list of strategies, methods, and tools that departments can utilize when developing their workforce plans and be equipped to complete their Needs Assessment Workbook.

A *succession analysis* should be prepared that forecasts the supply of people for certain positions. Succession plans should be used to identify potential personnel changes, to select backup candidates, and to keep track of attrition. The external supply of candidates is also influenced by a variety of factors, including developments in technology, the actions of competing employers, geographic location, and government regulations. A number of local governments have begun to examine succession planning for their executive positions. They have put together talent banks listing incumbent employees' current skills and areas of expertise, job preferences, and possible new skills the employees may need in order to be promoted. Succession planning becomes more important as the labor supply tightens and the unemployment rates hit low levels. Los Angeles County has developed a Training Academy to enhance the skills of its current staff. A variety of certificate programs are offered that encompass leadership, problem solving, and creativity training.

HRP attempts to match the available supply of labor with the forecasted demand in light of the strategic plan of the organization. A gap analysis is the process of comparing the workforce demand forecast with the workforce supply projection. The expected result is the identification of gaps and surpluses in staffing levels and competencies needed to carry out future functional requirements of the organization. A gap occurs when the projected supply is less than the forecasted demand. It indicates a future shortage of needed employees. Strategies such as recruitment, training, succession planning will need to be developed and implemented.

A surplus is when the projected supply is greater than forecasted demand. This indicates future excess in some categories of employees that may also require action to be taken. The surplus data may represent occupations or skill sets that will no longer be needed in the future or at least not to the same degree. Retraining, transfers, or separation incentives may need to be implemented to address surplus situations.

HRP involves the development of strategies to address future gaps and surpluses. There are a variety of factors that will influence which strategy or which combination of strategies should be used. Washington State has identified some of the factors:^[7]

- *Time*: Is there enough time to develop staff internally for anticipated vacancies or new competency needs, or is special, fast-paced recruitment the best approach?
- *Resources*: The availability of adequate resources will likely influence which strategies are used and to what degree, as well as priorities and timing.
- *Internal depth*: Does existing staff demonstrate the potential or interest to develop new competencies and assume new or modified positions, or is external recruitment needed?
- *"In-demand" competencies*: How high the competition is for the needed future competencies may influence whether recruitment vs. internal development and succession is the most effective strategy, especially when compensation levels are limited.
- *Workplace and workforce dynamics*: Whether particular productivity and retention strategies need to be deployed will be influenced by workplace climate (e.g., employee satisfaction levels), workforce age, diversity, personal needs, etc.
- *Job classifications*: Do the presently used job classifications and position descriptions reflect the future functional requirements and competencies needed? Does the structure of the classification series have enough flexibility to recognize competency growth and employee succession in a timely fashion? Does it allow compensation flexibility?

If necessary skills do not exist in the present workforce, employees will need to be trained in the new skills or external recruitment must be used to bring those skills to the organization. The employer must identify where employees with those skills are likely to be found and recruitment strategies must be developed.

IMPLEMENTING HUMAN RESOURCE PLANNING

To implement HRP, it is important for HRM departments to expand their scope of activities beyond the

traditional HRM tasks and functions, and enter partnerships with managers and employees. Working together provides managers and employees a better understanding of HRM issues. Likewise, HRM staff becomes more informed about the needs of the employees and departments.

To facilitate the partnership, HRM Departments should establish a human resource planning task force composed of managers and/or staff from a variety of departments, and staffs from the HRM department who are responsible for identifying the trends and challenges that will impact the agency. The task force should involve other employees seeking their input and observations. This can be done through the use of surveys, focus groups, agency publications, or a needs assessment instrument. After the task force receives information, it should prioritize the most critical issues. HRM staff should be directed to develop strategies, solutions, and alternatives to address the issues.

Questions that should be investigated and planned for include:

- Is the top administration committed to quality and excellence?
- Are changes necessary?
- How can we meet employees' perceptions and concerns?
- Which employees will be affected?
- What barriers might be there to successful implementation of HRP?
- Once program cost estimates are developed, will dollars be provided for training and development?
- Who will be responsible for the implementation of HRP?
- Who will evaluate and adjust the planning process?

Once these questions have been answered, authority and resources must be assigned to the person(s) responsible for the planning and implementation of HRP. Failing to put human and financial resources into HRP will relegate it to just another fad. Organizational leaders must demonstrate their commitment to HRP and champion it.

CONCLUSION

HRP determines the human resource needs of the agency and ensures that qualified personnel are recruited and developed to meet organizational needs. Turnover, including retirements, must be anticipated and planned for. The HRM departments must track the skills of incumbent employees and keep skill inventories. Recruitment and training must be tied to the organization's mission. Should there be a shift in demand for services; agencies must know whether there are potential employees with the requisite skills available to provide these services and whether the agency's finances can afford the costs associated with additional compensation and benefits. Forecasting an agency's human resource supply reveals the characteristics of its internal supply of labor; it also helps to assess the productivity of incumbent employees, implement succession planning and salary planning, and identify areas where external recruitment and/or training and development are necessary.

Human Resources Administrators in State Government, Changing Roles of

Curtis R. Berry

*Department of Political Science, Shippensburg University,
Shippensburg, Pennsylvania, U.S.A.*

INTRODUCTION

Numerous challenges and expectations confront human resources administrators in state government today. The “devolution” of governmental responsibilities by the federal government has shifted increased responsibility for domestic policy to the states. A sluggish economy has created, in several states, intense budgetary pressures and the need to cut expenditures or impose tax increases. Terrorist threats and workplace violence increasingly make the headlines and contribute to increased anxiety in the workplace. Today more than ever state personnel agencies are experiencing increased pressure to provide effective, meaningful, and timely assistance to agencies of state government.

GROWTH IN STATE BUREAUCRACIES

In May 2002, the seasonally adjusted number of persons employed by the 50 states totaled some 4,930,000. Increases in state employment levels were recorded in 9 of the 11 years between 1990 and 2000 and by 10.2% between 1991 and 2000. These increases, however, were not evenly distributed across the 50 states or among agencies or programs within the states. Between October 1990 and April 2000, 36 states experienced a net increase in full- and part-time employment, with 26 states experiencing growth of 10% or greater and six states experiencing growth of 20% or more in their level of employment. Since the fall of 2001, numerous states experienced fiscal stress brought on by the recession (and the events of September 11, 2001). Commentators were once again focusing on the phenomena late hired, first fired and the implications that it holds for minority and female employment (Table 1).^[1,2]

ORGANIZATION OF STATE PERSONNEL AGENCIES

With the exception of Texas, all states have a centralized personnel function, although significant differences exist in their structure and scope. In 47 states, a single

personnel office has primary responsibility for most activities associated with the personnel function. In some, one or more functions (e.g., labor relations or appeals of adverse actions) may be assigned to a separate organization. Some offices have responsibility for serving only state agencies or departments; other have additional responsibilities for educational institutions and/or local government administrative units. Two states, Pennsylvania and California, divide responsibilities associated with directing the state merit system into separate agencies. In about one-half of the states, the personnel function operates as a stand-alone administrative entity, whereas in the remaining states it functions as a division of a larger administrative structure, such as an Office of Administration. The chief personnel official in most states (26) is selected by the governor; officials in 15 states are appointed by the department head of the agency in which the personnel office is located; in the remaining states, a personnel board makes the appointment. Finally, the number of employees the office is responsible for ranges from about 10,000 in New Hampshire to 188,000 in New York.^[3–5]

FUNCTIONS OF THE CENTRAL PERSONNEL AGENCY

Functions of the central personnel agencies alone or shared with operating agencies included activities such as recruitment, test development and administration, issuing hiring rules, classification and compensation administration, labor-management relations, and appeals of personnel actions. The range of functions and roles handled by the central personnel agency in the states is shown in [Table 2](#).

Recruitment

Recruitment of personnel is a vital function with central personnel agency normally developing and disseminating recruitment literature, and maintaining a pool of applicants certified for appointment for the various state agencies, educational institutions, and local governments served by the office. The Internet

Source: Adapted from Refs.^[43] and ^[44].

has substantially increased the potential audience of their recruiting efforts in recent years. Central personnel agencies' web sites linked to their state's "Home Page," as well as nationally focused web sites, such as "U.S. Government Info/Resources/Jobs in State Government: State Employment and Job Openings Web Sites," "State Job Search," and "State Government Jobs," to name a few, have opened up an unparalleled audience for state recruitment efforts in the twentyfirst century.^[6–8]

Test Development and Administration

Decentralized testing and assessment of applicants has been widely discussed; however, it generally remains the responsibility of the central personnel office. Although Wisconsin has received a lot of attention for decentralizing testing, the actual extent of that decentralization is somewhat limited. Test development and validation is a highly technical, time-consuming, and expensive endeavor. It must be undertaken in a manner consistent with the requirements of federal civil rights laws, as well as specific and perhaps unique requirements of the agencies being served. In addition, the "client" agency may assist in developing procedures or standards used by panels who conduct oral interviews of applicants for vacant positions. The central personnel agency has responsibility for certifying test results and applying the veteran's bonus points to passing test scores of qualifying applicants. Finally, civil service lists of "eligibles for appointment" must be continually updated.^[3]

Hiring Process Constraints

Political choices play a significant role in the policies associated with hiring employees. Hiring constraints

include the desire for a socially representative bureaucracy at a time when there is a backlash against the use of affirmative action, which for some implies "reverse discrimination." Popular initiatives, legislation, or gubernatorial executive orders have restricted or banned the use of affirmative action, causing states to rethink their strategies for achieving a workforce representative of the society it serves. Many have adopted policies that are less aggressive or threatening to the interests of majority group males, effectively stunting efforts to achieve a representative workforce in the short term. Today, the focus is on "workforce diversity," a concept open to interpretation as to meaning and extent of effort in pursuing a representative bureaucracy.^[9–11]

Another hiring constraint can be found in statutory rules mandating reliance on the so-called "Rule of 3." A number of jurisdictions have sought ways to expand the pool of persons eligible for consideration through interviews. States have expanded the pool of applicants under consideration by adopting a "Rule of 5" (e.g., Alaska, Kentucky, Maryland, Nevada, South Carolina); a "Rule of 6" (Maine); a "Rule of 7" (Washington), a "Rule of 10" (Alabama, Arkansas, Idaho, Ohio, Oklahoma, West Virginia); or a "Rule of 15" (Delaware, Missouri). In Connecticut and Kansas, anyone who passes the examination may be interviewed. In some states, agencies may hire applicants based on the specific requirements of the position.^[3]

"Veterans' preference" systems represents yet another major constraint on the hiring process used by agencies to fill vacancies. Typically, the preference entails awarding of "bonus points" to the test scores of qualifying veterans. At least 42 states award bonus points of 2, 5, or 10 points to qualifying veterans. Disabled veterans or veterans with service/combat-connected disabilities may receive bonus points of 10,

Table 2 Functions and responsibilities of central personnel agencies in the states

- Establishes minimum qualifications
- Merit system testing

15, or 20 points, depending on the state in which they are seeking employment. At least seven states have an “absolute preference” in the appointment of personnel.^[3,12]

Position Classification

Classification is typically a function that the central personnel agency shares with operating agencies or those who contract with it for services. The number of separate classifications found in a state can be enormous, with some 6169 existing in New Jersey in the

mid-1990s. Several factors contribute to this situation. States with large workforces responsible for a multitude of activities typically have larger numbers of classes. Growth in the number of classes is also linked to “grade creep” and efforts to circumvent the restrictive nature of the compensation plan linked to the classification system. The frequency with which the overall system undergoes a comprehensive updating significantly affects the number of classifications. Finally, absolute veterans’ preference may cause agencies to prepare narrow position descriptions and classification specifications to mitigate against the negative impact such systems have on sound personnel selection procedures.^[12,13]

Managing the Compensation Plan

Revisions to the compensation plan require that the agency address several important concerns. It must carefully consider how many steps or levels will exist in the plan. An appropriate balance must be struck between longevity and qualifications. Further, if employees are guaranteed step increases plus cost of living adjustments during their career with the organization, they may become complacent. Consequently, the organization needs to prudently consider how much of a percentage change there should be between increments in the salary plan. Generally, the larger the increments, the more time an employee should remain within a pay grade.^[9,14]

To minimize the future implications of negotiated compensation increases, the agency may seek payment of a one-time only “bonus” to employees in lieu of an increase in the base pay structure. Such a strategy allows management to claim that it has addressed the needs of employees to keep pace with inflation in a particular year, but without making the long-term commitment of modifying the base. By limiting growth in the base, the employer’s related expenses for social security, Medicare, pensions, health and welfare benefits, and the like are held constant at the current level. Employee unions will likely resist proposed bonuses because future compensation levels and other benefits are not positively enhanced or adjusted to keep pace with inflation.^[15]

Controlling Benefit Costs and Increasing the “Value” of Benefits

Employers are increasingly asking employees and/or their unions to choose between improvements in salary/wage levels or preserving existing benefits and minimizing the shift to employee contributions (e.g., higher deductibles or copayments) or reductions

in levels of coverage. Imposing higher deductibles represents a significant cost containment strategy. The greater the deductible, the lower the premium the employer and/or employee pays. Another tool involves use of an offset, which represents a benefit paying something less than 100% of the lost income or expense replacement. Coordination of benefits has become commonplace and entails ascertaining if a scheduled payment can be reduced or rejected because it is covered by a spouse's plan. Finally, a coinsurance/copayment benefit provision in which the employee generally must pay a fixed percentage of the cost of service provided by a benefit on each occurrence of use is another significant cost containment mechanism.^[16,17]

"Cafeteria benefits" programs allow employees to personalize the range of benefits and levels of coverage contained in their compensation packages. "Flexible spending accounts" represent yet another option to assist employees in tailoring a benefits program to meet their unique needs. This form of "cafeteria benefits" allows an employee to set aside "pretax" dollars into a specific fund for recurring or routine medical, dental, and dependent care expenses. Funds are then deducted from the account to pay the incurred expenses. The principle advantage of these accounts is that neither income nor social security taxes are paid on the funds set aside.^[16,18]

Early Retirement Incentives and Cost Savings

Early retirement incentives and "window" periods have been created to enable employees to separate from the personnel system prior to the normal retirement age, with fewer years of service than normally required to qualify for full pension entitlements and/or with "bonus" credits allowing the retiree to enjoy a higher monthly pension. In considering such a strategy, several issues must be considered in determining its appropriateness. First, determining which employees are to be targeted and how the incentive will affect their decision to leave the system. Second, deciding whether the objective is to permanently eliminate positions or merely replace more "expensive," older personnel with younger, less expensive ones. Additional administrative expenses and resources associated with implementing the early retirement effort must also be anticipated and accounted for. Finally, these incentives may not yield the cost savings expected when initially considered. Careful analysis must be undertaken to avoid a situation in which, rather than producing substantial financial savings, the effort ends up haunting the jurisdiction for years to come and creates nearly insurmountable barriers to future early retirement incentive efforts.^[14,19,20]

Labor Relations and Collective Bargaining

Collective bargaining rights for state employees exists in some 28 states plus the District of Columbia. Strikes by public employees are strictly prohibited, with severe penalties imposed in the event of an illegal strike or job action in all but 13 states that authorize a "limited right to strike." The central personnel agency may bear responsibility for contract negotiations with a number of separate bargaining units (and unions), representing a wide range of employees, negotiating in succession, with each attempting to gain a better deal than the one arrived at previously by other units. Once negotiated, the office advises line agencies on matters related to the implementation and enforcement of the "master" collective bargaining agreement in a wide array of units that may have local agreements or "side letters," which have an impact on the bargaining relationship.^[21-24]

Appeals of Adverse Actions

Adverse action appeals may be handled through administrative reviews in the operating agency and/or the central personnel agency. When the facts are in dispute, hearings before an impartial decision-maker leads to factual determinations and recommendations for resolution. These "preliminary" determinations are subject to final review by the agency head and/or merit protection panel operating in the jurisdiction. Critics of the merit system cite the amount of time and documentation necessary to terminate public employees which appears to be generally low. Delays are often a function of a backlog of cases and the inability to schedule hearing until months after petitions are filed. Requests for continuances by one or both of the parties and the need for multiple hearing dates may also push back the final decision date.^[3,12,25]

Outsourcing and Privatization

Privatization efforts in the state government can range from "modest"—such as reliance on clerical employees provided by a temporary employment service while a permanent employee is on maternity or military leave—to private sector construction and lease back of facilities, to construction, staffing, and operation of correctional facilities. Appropriate administrative controls need to be developed prior to implementation of privatization initiatives. Promised savings should be closely scrutinized to ensure that they are real and that private delivery of such services are not more expensive than the public systems they replace. Additional staff may have to be hired and trained to draft complex

contracts that cover the specific services for which government is seeking private sector bids. Poorly crafted requests for proposal and contract language may result in vendors delivering far less than what advocates of privatization expected. Contract compliance officers must be employed to monitor and oversee the implementation of contracts to ensure that government is getting that for which it has paid. Agencies need to develop tools to effectively and accurately measure performance, and account for all relevant costs to realistically determine if tax dollars are being saved and the public is being served better.^[26]

Preserving Merit System Principles

The federal government has been a driving force behind the implementation of merit-oriented personnel systems in state government. Today, such standards are set forth for recipients of grants-in-aid. The standards cover recruitment and selection of personnel promotions, equitable compensation, access to training opportunities, continued employment based on adequate performance, identification of prohibited partisan abuses, and fair treatment in all aspects of personnel administration.^[12]

Beginning in 1976, a trilogy of U.S. Supreme Court cases,^[27-29] addressing “freedom of association” protections began to have a profound impact on the manner in which elected officials and political appointees carry out or influenced the process of staffing and maintaining bureaucracy. These decisions make it essential for personnel departments to clearly identify those positions that are legitimately policy making in character and are therefore among those organizational slots that may be properly filled on the basis of political sponsorship.

A final factor restricting political sponsorship or spoils patronage are the standards for imposing discipline in collective bargaining agreements. Such agreements often cover persons occupying non-managerial positions that were once the prize to be claimed after the election was won. Contracts specifically limit dismissals to a “just cause” determination subject to appeal through the grievance procedure culminating in binding arbitration. These provisions coupled with the union’s “Duty of Fair Representation” create a powerful incentive to challenge the legitimacy of terminations, which smack of patronage dismissals.^[19,30,31]

Several steps can be taken to minimize organizational exposure to judicial challenges on the basis of alleged patronage employment practices. The personnel agency should develop and disseminate clear statements concerning patronage practices and nepotism in the workplace. Such pronouncements should clearly state the organization’s commitment to “neutral

competency.” Positions which are non-policy making should be clearly identified, and the organization should state its commitment to identifying qualified personnel for such vacancies.^[32]

EMPLOYEE RELATIONS ISSUES CONFRONTING THE CENTRAL PERSONNEL AGENCY

Nepotism and Workplace Romances

Nepotism policies prohibit relatives and spouses from being employed in the same organization, the same office, or in a supervisor-subordinate relationship. Such policies exist to protect the “merit principle” by preventing the appointment of employees on the basis of family connection rather than competence. In addition, such policies are intended to prevent the potentially disruptive consequences that may arise when married couples work together. Restrictive policies may adversely affect the employment opportunities of dual career couples. Organizations may minimize inequities created by such policies by clearly defining the family relationships [i.e., spouses (including “partners or companions”), children, parents, brothers, sisters, blood relatives] covered by the policy. The policy should then stipulate that these persons are not be permitted to work in the same department, under the direct line of supervision of each other (first and second line), or be involved in decisions affecting each other in areas involving compensation, benefits, promotion, performance appraisal, etc.^[33,34]

Personnel offices have also increasingly had to deal with employees who date one another or who cohabit. Promulgating policies that balance the employer’s legitimate interest and concern in maintaining an efficient and effective workplace while respecting an employees right to privacy is problematic. Office romances may undermine employee morale if coworkers believe a colleague is receiving special treatment as a result of their relationship with a superior. The employer has legitimate concerns about the possibility of the romance turning sour and the subordinate employee raising allegations that they are being sexually harassed or punished for ending the relationship. Non-fraternization policies will not prevent office romances from developing, but well-thoughtout policies can minimize the negative potential of such relationships for the organization.^[35,36]

Sexual Harassment Policy

The central personnel agency must develop and promulgate specific policies that assist organizations to

identify and root out sexual harassment whenever it arises in the workplace. Central personnel offices should, in consultation with employee representatives, develop and disseminate to all agencies, departments, and bureaus under its jurisdiction a clear and unequivocal policy against all forms of sexual harassment. Education and training programs for supervisors and managers are a key component in the success of the program. All employees should be informed of what constitutes harassment, their right to raise the issue, and how they may file a complaint. An in-house grievance or complaint procedure, with appropriately trained individuals to hear and investigate fully and fairly all claims of sexual misconduct, should be developed. Staff responsible for conducting the investigation should be sensitized to the special aspects of sexual harassment cases. Investigators should listen and take complaints seriously. Immediate steps should be taken to stop the harassment and rectify any wrongs that have been documented. When the evidence warrants, transfers, training and education or disciplinary action should be directed against persons engaging in harassing conduct.^[37,38]

Addressing Violence in the Workplace

Various steps can be taken to minimize threats to employees in the workplace. The personnel office must develop and promulgate a comprehensive policy on workplace violence that provides clear direction to agencies. Included would be information that helps employees to identify the warning signs that an employee, former employee, client, or vendor is potentially violent. The policy should also provide direction to employees to help them to minimize personal threats they may encounter and to deescalate potentially violent situations. In addition, the policy should provide a detailed reporting mechanism to document and communicate to superiors threats or incidents that employees observe, receive, or encounter on the job. Finally, a “zero tolerance” policy with respect to employees bringing weapons to the workplace should be adopted, which includes a provision for a “measured response.”^[39,40]

Potential threats to the workplace may be addressed by preemployment background checks on prospective employees and inquiries about prior incidents of violence from previous employers. Persons with a history of workplace threats or violence obviously should not be employed if a potential for similar behavior in the future exists. In addition, the central personnel agency, in consultation with those responsible for facilities management should evaluate security measures and use of barriers, security devices, etc., to minimize threats to employees.^[39,40]

Qualified Immunity/Civil Suits for Damages

Central personnel offices are responsible for disseminating clear statements to all personnel that violating the constitutional or statutory rights of public employees, agency clients, or persons incarcerated or subject to the authority of the state’s paroling authority is intolerable. If employees knew or should have reasonably known that the actions taken were in violation of someone’s rights, they may be found liable for damages. Employees should receive appropriate training regarding their job-related actions that may create legal liability. In the current legal environment, employees enjoy what might be characterized as “qualified immunity.” As such, if a violation of protected rights occurs, they may be sued personally for actual and punitive damages associated with rights violated. When allegations arise regarding employee involvement in violations of protected rights, the employer should conduct an independent internal investigation to determine if any of its policies or rules were violated that might subject the employee to discipline or discharge.^[41,42]

THE INTERNET: MASTERING AN EMERGING RESOURCE

The Internet has the promise of making it considerably easier for the agency to fulfill its mission. Recruitment efforts, for example, can and have been enhanced as agencies post information about position vacancies, civil service position announcements, testing requirements, submission of applications, and the like. Test development and validation efforts have the potential for significant improvement due to the ability to have nearly instantaneous access to information from operating agencies, professional associations, personnel agencies in other states, and the federal government. The central personnel agency staff has instant access to information from federal databases, and professional counterparts in other states without ever having to telephone anyone or send a written request for information. As the knowledge explosion continues, the Internet affords personnel agencies a low cost means of keeping pace with available information.

Human Resources Management in Local Government

J. Edward Kellough

School of Public and International Affairs, University of Georgia, Athens, Georgia, U.S.A.

INTRODUCTION

In the broadest sense, human resources management encompasses everything connected with the management of people in organizations. More specifically, it is that area of activity associated with the recruitment, selection, training, compensation, and discipline of employees. These functions are central to effective management; in the public sector, which is heavily labor intensive, that significance is magnified. Furthermore, in local governments, jurisdictional size and the nature of certain public services provided will shape the context of human resources management in important ways. Small local governments, for example, may lack the capacity necessary for in-house delivery of critical human resource management functions, and in some locations where the legal environment is permissive, public employee unions play an important role in shaping the nature of human resource management policies. Some local government services, including police and fire protection, have long histories of union activity.

certified as eligible for employment and have their names placed on a list or register in descending order by examination score. Those selected for employment are required to come from the top of the list. In many jurisdictions, rules will limit selection to among the top three (or four or five) on the register.

Of course, the integrity of selection processes organized in this fashion depends in large part on the validity of the examinations used. In this context, validity refers to the extent to which the examination used actually measures job qualifications. The most widely used approach to assessing examination validity is based on the notion that an examination for selection should reflect job content and should do so proportionately. For example, an examination for a clerical position might assess a job candidate's word processing skills, provided that the job requires word processing as part of its ordinary activity. It is not unusual for smaller local governments to use examinations developed and validated by consultants or other larger public organizations, given the limited resources often available in smaller jurisdictions.

FUNCTIONS IN HUMAN RESOURCES MANAGEMENT

Employee Selection

One of the most significant human resources management functions is employee selection. Obviously, it is in the interest of local governments, or any organization, to select employees who are capable and well qualified. In the public sector, of course, a responsibility to the citizenry makes that objective even more imperative. Typically, public jurisdictions structure selection processes through merit systems designed to ensure that employees and applicants for employment are screened on the basis of their ability to perform the jobs at issue. The focus of activity is on open competitive examinations of qualifications. Examinations may be written or non-written, and may include assessments of job knowledge, skills, abilities and, in certain instances, physical capabilities. Often, the selection process involves a combination of several examination techniques. Individuals who pass an examination are

Job Analysis, Job Evaluation/Classification, and Compensation

Job analysis, job evaluation/classification, and compensation are also major human resources management functions. Job analysis is the process of systematically examining and determining job content. The purpose is to identify the tasks and activities involved in a particular job, the amount of time devoted to specified tasks, and the kinds of knowledge, skills, and abilities required to perform the job effectively. Once this information is collected, it may be used to inform selection procedures and the construction of examinations, employee performance appraisal systems, and compensation decisions. Questionnaires completed by employees and supervisors, employee interviews, and direct observation are a few of the techniques used to collect data on job content. The information is organized and presented in a formal written document known as a job description, which specifies the nature of the job, the various tasks involved, and the qualifications required.

Once job descriptions are developed, jobs may be compared with one another so that the relative value of each may be determined. This is known as job evaluation, or sometimes as job classification. It is based on the assumption that an employee's rank within an organization should be determined by the nature of the job or position held—a concept known as rank in job. The most common approach to job evaluation is one in which jobs are assessed based on the presence or absence of a set of specific job characteristics or factors. Typical job factors used, include knowledge, skills, contacts with other employees, responsibility for materials and equipment, working conditions, and physical effort required. The factors are weighted and various levels of each are identified. Points are then assigned to each level of each factor, and jobs are then assigned points on the basis of the presence in the jobs of the specified levels of each factor. Once points are assigned to a job on the basis of each factor, a summary score is then developed by adding the factor scores. The summary scores or point totals are then assumed to represent the relative value of jobs analyzed.

After job evaluation is completed and a determination has been made regarding the relative value of the jobs in an organization, the stage is set for the development of a compensation or pay structure. An underlying purpose here is to ensure that employees are treated fairly with respect to compensation. This objective will require that employees with different jobs be paid differently and employees with similar jobs be paid similarly. Jobs that have been determined to have lower relative values will be paid less than those that have higher values. In this manner, the compensation structure, which is usually based on the identification of specific pay grades, will provide equity internally among employees within an organization. It is also important, however, that an organization achieve what is known as external equity, which is the idea that employees be paid fairly relative to what employees in other organizations are paid. Obviously, this objective requires that the organization collect and analyze salary information from the labor market within which it operates.

Clearly, job analysis, job evaluation, and compensation are based on complex and time-consuming processes. Significant skill is necessary to properly complete these functions. Again, smaller local governments may not always have the resources in terms of skilled staff members who can perform these functions. There is an industry of private consultants available, however, to assist in the provision of these services, and smaller jurisdictions may turn to them for such assistance. It is true, though, that consultant's services are often very expensive; as a result, human resources functions associated with job analysis and evaluation

are sometimes not adequately performed in small governments. Large municipalities and urban county governments are usually in a much stronger position to take advantage of professional human resources services, either from well-known consulting firms or from professionals employed in their own human resources management staffs.

LOCAL GOVERNMENT FRAMEWORK

The legal framework within which local government human resources management occurs is also extremely important. As is the case in any public sector setting in the United States, constraints imposed on government by the Constitution significantly influence the nature of human resources practices in local government. In particular, the constitutional guarantee of equal protection of the laws found in the Fourteenth Amendment will restrict the government's ability to draw distinctions among employees and may be particularly important in limiting the nature of affirmative action programs used within selection and promotion systems. Constitutional requirements of due process also significantly shape human resources policies, especially in terms of adverse actions taken against employees. Due process requires, for example, notice and a hearing prior to the dismissal of most (although not all) local government employees. Employees' First Amendment rights to freedom of speech and association must also be protected.

State law also provides further limitations on the operation of human resources management practices in local government settings. States may mandate specific kinds of procedures or practices, and of course, these laws can vary considerably from one state to the next. A good example is provided by laws governing the operation of public employee unions in local governments. Some states permit collective bargaining on a range of issues, including salary and benefits, whereas other states prohibit bargaining in any form with unions and their representatives.

CONCLUSION

In sum, human resources management in local government is a dynamic field. Although the core functions associated with the effective management of human resources are the same in all jurisdictions, the manner in which those functions are carried out varies considerably, depending on the size of local governments and the availability of resources. Variation across the states in the legal framework as specified in state law will also determine the nature of local government human resources practices.

Human Rights, Ethical Analysis of and in Public Policy

Cyrus Ernesto Zirakzadeh

Department of Political Science, University of Connecticut, Storrs, Connecticut, U.S.A.

INTRODUCTION

Today, politicians and political activists of different partisan bents and ideological leanings cite “human rights” as a warrant for extraordinary action. Protesters sometimes justify civil disobedience on the grounds that they are protecting or promoting human rights. Citing the need to punish violators of human rights, superpowers sometimes intervene in other states’ affairs and, on occasion, inflict economic boycotts, war, and other forms of suffering on foreign populations.

Of course, protesters, nation states, and other political actors sometimes are mistaken, insincere, and dishonest when they declare that are acting to protect or promote human rights. Still, human rights are cited often enough to merit an investigation into its meaning. What do we mean when we sincerely talk about human rights? What are the implications of human rights for public policy?

DUAL CHARACTER OF HUMAN RIGHTS

“Human rights” is a compound concept with philosophical and political connotations.

The concept is partly rooted in a Western tradition of moral philosophy—sometimes called the natural-rights tradition—that stretches back at least as far as the ancient Greeks. This tradition derives moral prescriptive judgments from a presumption that underneath the flux of daily life, a timeless natural order exists independently of humans’ preferences and wishes. One element of the timeless order is a fixed human nature.

According to Aristotle, systematic observation of the world reveals that humans are a distinctive species. Among all animals, humans are uniquely able to make reasoned judgments about competing values and about right and wrong behavior. Human-rights philosophers since Aristotle have contended that this choice-making characteristic of human beings is self-evidently valuable and should be protected by all governments. Moreover, its protection ought to outweigh competing government duties, except under truly extraordinary circumstances, such as military invasion. In the language of contemporary human-rights philosophers,

human rights normally should “trump” all competing political interests, values, and goals.

The notion of human rights has another connotation that arises from often blood-drenched histories of political struggles against tyranny. For many political observers and scholars, “human rights” refers to those quasi-constitutional arrangements that have been established to minimize the danger of arbitrary and violent action by rulers against the ruled. Here, the concept is closely connected to specific civil rights and legal processes, such as rule of law and the principle of habeas corpus. A government’s “human-rights record” refers to the government’s palpable treatment of citizens and to the citizens’ practical rights to dissent and contest.

The choice-making and antityrannical connotations of human rights are equally true. Neither meaning is false, and one is not superior or more important than the other. The two meanings are, in a sense, different sides of the same conceptual coin. The philosophic meaning celebrates opportunities for individuals to be creative. The legalist tradition celebrates constraints on the power of the state.

HUMAN RIGHTS AS THE OPPORTUNITY TO MAKE CHOICES

Many natural-rights and human-rights philosophers, such as Jack Donnelly, H. L. A. Hart, and Ronald Dworkin, used evocative phrases, such as treating people as “ends in themselves” or as “subjects, and not objects,” to convey their public-policy orientations. Such pithy mottos assume that all humans are supremely valuable because of their capacities to establish goals, to dream of alternative conditions, and to deliberate about and prioritize aims. Stated differently, the policy implications of human rights arise from the assumptions that humans are meaning-creating creatures who are capable of choice, and that this creative, self-directing capacity should not be curtailed except for extraordinary reasons. Therefore (argue human-rights philosophers), public policy should be guided foremost by the principle that each person should be as free as possible to choose how to dispose of time, energy, and other possessions. Any government

that infringes on its citizens' opportunities to be autonomous (or self-directing) must demonstrate that such actions are needed to protect citizens from a clear, immediate danger of significant proportions. Otherwise, the government's infringement is illegitimate, and citizens have the right to defy, rebel, and (if necessary) overthrow political authorities.

Some human-rights advocates, such as Milton Friedman and Ayn Rand, make almost no further recommendations about legitimate government action. In effect, they say that a government should resemble the proverbial night watchman, whose sole task is to insure that enough peace exists within the community for individual residents to pursue their private dreams. On strictly human-rights grounds, a government should not enforce or implement a particular theory of economic justice on citizens, because this may limit individuals' opportunities to reason morally for themselves. Perceiving the laissez-faire implications of human rights for public policy, Karl Marx criticized the concept's celebration of greed, competitiveness, and self-concern.

Some political philosophers and theorists, however, have deduced more ambitious lists of government responsibilities from the working assumption that all humans are endowed with a capacity to choose. These authors argue that the capacity to choose requires that the government directly or indirectly promote specific social and economic conditions.

One condition that is frequently cited in the human-rights literature is economic security. Some writers believe that without protection from hunger, homelessness, and joblessness, a person cannot have the peace of mind needed to reflect carefully and systematically on values, options, and priorities. Donnelly, for one, argued that governments in advanced capitalist societies must assure all citizens a minimum standard of living (including minimum levels of education, health care, and housing), although Donnelly denied that there need be either a strict equality of condition among all citizens or state ownership of the means of production. In Donnelly's opinion, the exercise of human choice presupposes, whenever possible, an extensive but never totalitarian welfare-capitalist order (akin to the social democratic practices of northern Europe).

Some human-rights philosophers contend that because of contemporary sexual stereotyping, the development of the moral reasoning capacity of human beings requires that the state regulate gender relations and extinguish popular prejudices that may deter some citizens from aggressively defining and pursuing their own goals. Martha Nussbaum, for instance, contended on human-rights grounds that a government should protect its gay and lesbian citizens from housing discrimination, from exclusion from the military, and from daily verbal harassment—hardly a laissez-faire

agenda. Arati Rao similarly argued on human-rights grounds that it is the government's responsibility to protect women from the internalization of feelings of worthlessness and inferiority, and that this may require governmental monitoring of and intervention in citizens' conventionally understood "private affairs"—for example, aggressive enforcement of laws against marital rape.

Donnelly's, Nussbaum's, and Rao's policy recommendations illustrate how the philosophic assumptions of human rights need not lead to the set of laissez-faire policy prescription envisaged by Friedman, Rand, and Marx. The number and kinds of public-policy recommendations that human-rights advocates draw depend in large part on their implicit theories of psychological growth. Broadly speaking, the larger the number of social preconditions that one considers necessary before citizens are emotionally ready to exercise their independent judgments to choose, the larger will be the number of the duties that one wants a government to undertake in the name of promoting human rights.

HUMAN RIGHTS AS THE MINIMIZATION OF TYRANNY

Unlike the philosophic approach to human rights that deduces political prescriptions from a mental vision of all humans as choice makers, Edmund Burke, in the late eighteenth century, championed a historical approach to appreciating rights. He argued that rights should not be viewed mathematically, as logical deductions from timeless principles. Instead, rights should be viewed as the outgrowth of collective experience in overcoming concrete dangers, tyranny in particular. Rights are those arrangements that have been demonstrated to protect groups and individuals from significant political harm.

According to Burke and the later followers of his historical approach, human rights are a logically messy collection of pragmatic rules of thumb that have been tested in actual political struggles and that have been shown to be valuable in constructing ramparts against authoritarianism and illegal rule. Perhaps the first collection of guidelines was the Magna Charta, which in 1215 prohibited the English King from capriciously convicting and punishing subjects. Since 1215, documents outlining proper restrictions on the state have become more commonplace across the globe and also have gradually grown longer. Consider the 1689 English Bill of Rights that specified limits to the King's authority to suspend laws, keep a standing army, and tax subjects. The U.S. Constitution's Bill of Rights (adopted in 1791) similarly enumerated several bulwarks against tyranny, such as citizens' right to bear arms.

Many historically oriented students of human rights believe that the 1948 United Nations' Universal Declaration of Human Rights marked a turning point in the evolution of these quasi-legal documents. Unlike previous documents, the Universal Declaration broadened the concept of tyranny to include social conditions that deprive human beings of different forms of happiness and respect. Later twentieth-century documents, such as the 1993 Vienna Declaration and Programme of Action, continued the practice of seeing social, and not just governmental, threats to personal freedom.

The Universal Declaration of Human Rights did not only explicitly prohibit cruel and unusual punishment by governments and their use of torture. It also proclaimed that dignified work, motherhood, free elementary education, the opportunity to participate in trade unions, and periodic holidays with pay are "human rights" that, if not politically protected and promoted, may compel people to engage in "rebellion against tyranny and oppression." Article 23 proclaimed that "everyone has the right to work" and a right to "free choice of employment," to "just and favorable conditions of work," to "just and favourable remuneration insuring for himself and his family an existence worthy of human dignity." Article 24 added that "everyone has the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay." According to Article 25, "Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services."

Some critics of the Universal Declaration, the Vienna Declaration, and other similarly worded twentieth-century documents say that these proclamations are little more than laundry lists composed by dewed-eyed reformers, and that the lists are for the most part disconnected from the concrete problems of tyranny that made earlier human-rights doctrines so important. After all, is it obvious that the absence of periodic holidays with pay is a form of tyranny and oppression that must be eradicated immediately? What about the absence of free elementary education?

Another common criticism is that these twentieth-century lists are disconnected from practical sensitivity to the constraints and possibilities posed by historical conditions. How can everyone be assured of "dignified work," in any non-trivial sense of the phrase, given the inevitability of monotonous and servile service-sector jobs even in the wealthiest of nations? And when we look outside the industrialized West, do these proclamations amount to much more than pie-in-the-sky thinking? Can decent housing and modern health services be provided for all citizens in most African and Asian countries, to take but one example?

Brian Barry is among the scholars who are wary of the usefulness of recent lists of human rights. He has openly wondered whether the conventional notion of human rights has drifted so far from the original anti-tyrannical concerns of the Magna Charta that the notion now is little more than shorthand for a particular group's image of desirable social relations—a topic on which opinions differ and about which there are no authoritative "right answers." Barry, moreover, found most of the specific rights listed in the Universal Declaration of Human Rights to be obscure and to be too vaguely stated to be useful even in debates. Barry mused that the cryptic statement in the Universal Declaration about everyone having a right to an "adequate" standard of living might mean no more than that the state is obligated to keep citizens at least barely alive. Any serious declaration of human rights ought to explain what grand phrases mean, insisted Barry. Otherwise, the declaration can have no practical, prescriptive force.

Maurice Cranston, going a step beyond Barry's critique, has argued that even if we give the current lists of human rights clear, substantive meaning, we soon will discover that the concept has become wildly utopian and therefore meaningless. Can we truly expect (Cranston asked) that impoverished nations in Africa and Asia will in the foreseeable future provide free elementary education to everyone? Where will money for teachers' salaries and professional training come from? What about school buildings, books, and electricity? Similarly, "special care and assistance" to mothers and "periodic holidays with pay" will seem utterly impossible goals as soon as we try to give these entitlements some concrete meaning.

Cranston may have a point. Can universal paid holidays, employment security for everyone, and "just and favourable remuneration" (to mention just a few provisions found in the Universal Declaration) be guaranteed to all residents in any major country, including those with the most prosperous, industrialized, and rapidly growing national economies of our day?

But, Cranston could also be wrong. One might, after all, believe in a more optimistic theory of economics and argue that sufficient economic resources already exist to meet almost all the social demands that the Universal Declaration of Human Rights enumerates. Donnelly, for example, has insisted that today, economic surpluses are adequate to realize the social rights listed in the Universal Declaration. The failure to secure these rights reflects a lack of political will, not a shortage of economic wherewithal (or so Donnelly contended).

A somewhat different line of criticism of the current political-historical notions to human rights draws on Sir Isaiah Berlin's seminal distinction between positive and negative freedom. A negative freedom (or negative

right) refers to a person's freedom not to be interfered with, to be left alone. As an example, consider the freedom to pray to the god of one's choice without pressure from the state. Negative freedom is, Berlin maintained, valuable, because it allows for idiosyncrasy, originality, and creativity. A positive freedom (or positive right) refers to the opportunity to affect the external world and thus master one's fate. Consider the freedom to petition a government official or to vote. Critics, such as Cranston, sometimes argue that recent declarations of human rights improperly mix negative and positive freedoms. This mixture is confusing, because it combines two different postures toward political rule: one highly critical and oppositional, and one highly supportive and almost supplicating. The notion of human rights pushes one, paradoxically, toward wanting to hem in the state and wanting to enlarge its powers. How can one derive a coherent and consistent view of public policy when one's basic attitude toward government is so bipolar?

Finally, many commentators have noted that the long list of rights that currently comprise human-rights documents fail to address the messy question of prioritizing policy claims. Of the many proclaimed rights in existence, which should the government take more seriously when conflicts in rights inevitably occur? Article 26 of the Universal Declaration of Human Rights, for example, states that all levels of education are to include a specific ethical curriculum that "promotes understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace." But, Article 26 in the same document states, "parents have the prior right to choose the kind of education that shall be given to their children." What if parents wish to teach their children to be wary and critical of the beliefs and practices of other nations, racial groups, or religious groups? Consider the following two hypothetical cases. What should happen if Catholic parents in southern California do not want their child to be exposed to the Islamic ideas of nearby Iranian-Americans, or Amish parents in Ohio do not want their child to be exposed in school to the more agnostic and materialistic values of nearby city dwellers? Which of these two rights governing education of children—the right to learn religious tolerance or the right of parents to choose the kind of education that their children will receive—takes precedence?

Similar questions arise when we juxtapose the human right to "own property alone" (Article 17) with the long list of employees' human rights to a livable wage, to job security, to a paid holiday, and to dignified treatment in a healthy workplace (Articles 23–25). Which, if any, of these rights is to be privileged—the rights of business owners to use their property as

they see fit or the rights of employees to particular wages, holidays, and styles of work?

PUNISHMENT OF RADICAL EVIL

One policy area where the notion of human rights has been applied with minimal conceptual criticism or confusion involves what the late legal philosopher Carlos Santiago Nino called the punishment of "radical evil." This phrase refers to large-scale acts of government violence against unarmed people, such as the Nazis' enslavement and extermination of millions of Jews, homosexuals, gypsies, and ethnic minorities; the "Young Turks" massacre of one-third of Turkey's Armenian population in 1914; and the Argentine military's torture and murder of thousands of students, lawyers, journalists, and peasants during the 1960s and 1970s. Regardless if one adheres to the philosophic understanding of human rights or the political understanding, such acts seem to be unquestionable violations of human rights on a large scale. What policy response is appropriate?

Nino, Hannah Arendt, and some other political philosophers and theorists have concluded that reasonable assessments of proper punishment are hard to reach, partly because it is difficult to determine who should be held responsible for atrocities on a such a scale: the soldiers who are expected in times of war to carry out orders without question; the bankers and industrialists who financially backed the tyrannies and therefore might be considered as complicit in the atrocities; or just a handful of top government officials who signed the orders to murder? Moreover, how does one determine the proper punishment for perpetrators of radical evil—what punishment could ever be commiserate with the scale of the inhumanity of the act? Lastly, because acts of radical evil usually are formally legal—that is, when the despicable violence was carried out, the perpetrators scrupulously adhered to the letter of existing laws and seldom technically violated them—how do outsiders who want to punish someone for the crime against human rights avoid charges of arbitrarily imposing one country's moral standards upon others? How can one reconcile the rule of law, which denies the legitimacy of *ex post facto* laws, with conscientious concern for human rights?

A few famous human-rights trials, such as the 1945–1946 Nuremberg trial of Nazi leaders, have been undertaken since World War II. Although Nino and Arendt were outraged by the Nazis' violence (Arendt died before the Argentine trial was held in the 1980s), both were greatly troubled, because at times, the victors seemed to arbitrarily impose their own standards of justice and openly trample on legal principles. Arendt and Nino were further troubled, because an unusually large

number of local onlookers (other than members of the victims' families) appeared disinterested in the course of the trials. Arendt and Nino reported that if anything, many citizens of Germany and Argentina expressed admiration for the perpetrators of radical evil because of their atypically high status and material wealth. Conversely, most local citizens expressed little outrage over the fate of the victims of radical violence, especially when the victims were poor, gypsies, or belonged to some other socially stigmatized group.

The apparent disinterest of local populations during trials of radical evil raises troubling questions about the extent to which the moral concept of human rights is held worldwide and among all social strata. Although some human-rights advocates, such as Donnelly and Dworkin, insist that arguments about human rights carry considerable weight among policy makers and citizens at large, the observations of Arendt and Nino suggest otherwise. Could it be that in the current pecking order of political goals and social values, the concept of human rights is not as highly placed as Donnelly and Dworkin contended?

Whether in the foreseeable future human rights will become more influential in domestic or foreign policy making depends in part on whether political theorists can satisfactorily answer current questions about conceptual vagueness, resolve debates about the social preconditions for human choice, address concerns about the economic practicality of twentieth-century human rights, and solve puzzles about prioritizing the many rights that human-rights documents currently proclaim. Perhaps if the meaning of the concept becomes more refined and its policy implications less ambiguous, the importance of human rights will become more salient to both government officials and everyday citizens.

Human Subjects Research: United States Public Policy

Patricia M. Alt

Department of Health Science, Towson University, Towson, Maryland, U.S.A.

Marcie Weinstein

College of Health Professions, Towson University, Towson, Maryland, U.S.A.

INTRODUCTION

While the benefits of scientific research on humans have been considerable, it has also raised many ethical questions, most notably about the treatment of the people participating in the research. Public policy makers have tended to produce regulations governing the conduct of human subject research in the aftermath of scandal. In the United States today, federal regulations apply only to research using certain types of public funds or in institutions that choose to apply them to all their activities. Some states have begun regulating research within their boundaries. The Health Insurance Portability and Accountability Act of 1996 (HIPAA) regulations have added a new layer of complexity to the use of medical information, and emerging areas such as stem cell research have become politically charged. Meanwhile, Federal agencies are encouraging publicly and privately funded research to spread beyond academic centers, with widely varied oversight; there is pressure for the use of central Institutional Review Boards (IRBs) (including for-profit organizations) instead of local ones; and some faculty organizations are calling for relaxed IRB review for social and behavioral research.

BRIEF HISTORY OF HUMAN SUBJECTS RESEARCH POLICY

One of the most notorious examples of policy making in crisis was the Nuremberg War Crime Trials, conducted at the end of World War II, which resulted in the drafting of the Nuremberg Code as a set of international standards for judging physicians and scientists who had performed biomedical experiments on concentration camp prisoners. The World Medical Association's Declaration of Helsinki, issued in 1964, further elaborated on these principles. The United States only developed strict policies about human subject protection in research when information about exploitation of subjects in this country became public knowledge in the 1960s and 1970s, painfully exemplified

by the famous Tuskegee Syphilis Study and the Milgram experiment.

Signed into law in 1974, the National Research Act (PL 93-348) charged the Department of Health, Education and Welfare (HEW) with codifying its human subject protection policies into federal regulations. It also created the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research, whose charge was to identify the basic ethical principles that should underlie the conduct of research involving human subjects, and to develop guidelines to assure that research is conducted in accordance with those principles. The Commission issued the Belmont Report in 1979, identifying three basic ethical principles, which when applied by scientists, subjects, and reviewers, were intended to provide an analytical framework for the resolution of ethical problems. In 1979, HEW [renamed the Department of Health and Human Services (DHHS)] started the revision of the 1974 regulations and gave final approval in 1981 to 45 CFR 46, referring to Title 45, Part 46 of the Code of Federal Regulations, Protection of Human Subjects.^[1]

The principles discussed in the Belmont Report are: *respect for persons*, which requires the acknowledgment of individual autonomy and the protection of individuals with diminished autonomy; *beneficence*, which translates into "do no harm," seeking to maximize potential benefits and minimize potential harms; and *justice*, referring to fairness in distribution of research benefits and burdens, so that no one group unduly bears the costs, while other groups unduly reap the benefits.^[2] These three principles form the basis for six norms of scientific behavior that the Belmont Report mandated for the ethical conduct of research, and they are summarized below:

- *Valid research design*: The researcher must use a valid design that takes into account relevant theory, methods, and prior findings; design is selected to minimize risks.
- *Competence of researcher*: The researcher must have the necessary skills and experience to carry out all procedures; the researcher is responsible for

training all other investigators; and the researcher is responsible for guaranteeing appropriate facilities for safe implementation.

- *Identification of consequences:* The researcher must provide subjects with an assessment of benefits and risks, taking care to establish a favorable balance of benefits to risks; the researcher must respect privacy and ensure confidentiality.
- *Selection of subjects:* The researcher must offer additional protections to vulnerable populations and enroll them only in minimal risk studies; the researcher must use fairness in enrolling subjects so that no groups are unduly burdened and no groups are excluded who may benefit.
- *Voluntary informed consent:* The researcher must obtain consent beforehand that must be obtained freely after the subject is fully informed, has the opportunity to ask questions, and demonstrates comprehension; consent means that explicit agreement is reached, and it can be withdrawn at any point during the study.
- *Compensation for injury:* The researcher is responsible for what happens to subjects and is required by federal law to inform subjects of possible compensation; compensation is not required.^[3]

The 45 CFR 46 regulations require institutions that receive federal funds and conduct research involving human participants to establish Institutional Review Boards (IRBs) for the purpose of protecting the rights and welfare of human research subjects. Specific requirements govern the composition and operation of IRBs; they must be composed of a minimum of five members, and their membership should be sufficiently diverse to guarantee expertise in a broad range of scientific, and also ethical, considerations. Racial and cultural diversity must be considered, as well as community representation.^[2]

Researchers submit their research protocols to their institution's IRB prior to conducting research, and IRBs use the following criteria to evaluate whether the proposals appropriately safeguard the rights and welfare of subjects:

Is the study design consistent with sound scientific principles and ethical standards?

Have all risks to subjects been minimized, including their right to privacy and confidentiality of participation?

Are risks to participants reasonable relative to anticipated benefits and the importance of the potential knowledge generated?

Is subject selection equitable? If subjects are drawn from vulnerable populations, such as children, pregnant women, and prisoners, are additional appropriate safeguards built in? Are questions of undue influence and coercion considered?

(Continued)

Are all necessary elements of voluntary informed consent present? Is the consent form written in language that would be understandable to a layperson? Are subjects apprised of all of their rights as a research subject, such as the right to withdraw without penalty?

Does the study design make adequate provisions to ensure the safety of subjects during their participation, and to modify protocols as appropriate, including discontinuation?

Are adequate provisions in place to safeguard the data at study conclusion to protect subjects' rights to privacy and confidentiality?^[2]

The IRBs are responsible not only for the prospective review of all research involving human participants but also for the ongoing review of each approved research protocol, at least annually. In an initial review, an IRB may approve a study protocol, may approve the protocol contingent upon modifications requested from the Board, may declare a study exempt from IRB approval if specific criteria are met, or may deny approval. An IRB has the responsibility to modify, suspend, or terminate an ongoing study that is not being conducted in accordance with its initial requirements or that poses serious risk to subjects.^[2]

While institutionally based IRBs provide oversight and assurances of human subject protection in their respective facilities, the Office for Human Research Protections (OHRP), which was formerly called the Office for Protection from Research Risks (OPRR), is the body responsible for broadly overseeing the implementation of 45 CFR 46 at the federal level. Housed in the Office of the Secretary, DHHS, the OHRP also provides guidance on ethical issues related to biomedical and behavioral research. Similarly, the U.S. Department of Education has federal regulations governing the protection of human subjects, known as 34 CFR 97, and provides oversight through the Grants Policy and Oversight Staff. In fact, a number of federal agencies have their own policies and regulations for human subject protection, and while they maintain their individual oversight functions and regulations specific to vulnerable populations, there is substantial similarity among them. In 1981, 17 federal departments and agencies adopted a common set of regulations known as the Federal Policy for the Protection of Human Subjects, or "Common Rule." The "Common Rule" is based on the ethical principles and standards outlined in the Belmont Report. The "Common Rule" was reissued in 1991, without change, and was again endorsed by the federal agencies it governs. Since then, it has been only slightly amended, although under constant scrutiny by a series of Federal advisory committees on human research protections.^[4] However, not all federally funded human subjects research is covered by those agencies. Although the "Common

Rule” has provided for essential safeguards, changes to the policies and procedures for human subject protection are often encouraged to increase overall flexibility and ability to adapt to emerging ethical and scientific issues.^[1]

The IRBs have the mandate to educate researchers about human subject protection and will, therefore, work with researchers to design or revise protocols in order to include the necessary safeguards. Some IRBs have begun requiring proof from investigators that they have been trained in the responsible conduct of research (RCR), which includes not only human subjects protection but also plagiarism, animal protection, etc. The Office of the Inspector General, in a series of 1998 reports, found that investigators had inadequate knowledge of their responsibilities toward human subjects.^[5] The National Institutes of Health now require investigators to have had basic human subjects ethics training in order to be considered for grant funding. However, the Department of Health and Human Services’ Office of Research Integrity policy requiring broader RCR training of all investigators was suspended indefinitely during 2001, following a Congressional request that it be reviewed further, and has not been reinstated.^[6] There is no common standard among federal agencies regarding investigator training in human subject research or RCR at this time.

The National Bioethics Advisory Committee (NBAC) issued a draft report called “Ethical and Policy Issues in Research Involving Human Participants” in December, 2001, just as it disbanded. This report advocated the creation of a centralized National Office of Human Research Oversight (NOHRO) to supervise all federal and private studies. The “Common Rule” does not currently apply to private, non-federally funded studies, but the committee pointed out the tremendous growth in privately funded research, particularly pharmaceutical, and argued that it should be held accountable to the same standards.^[7] The proposed centralized office would have also eliminated other problems associated with the “Common Rule,” including the difficulty and confusion in enforcing multiple sets of regulations without a single authority overseeing uniform protections. The “Common Rule” is considered inflexible and unable to adapt to emerging ethical and scientific issues. However, there was also fear that creating a centralized oversight agency would stifle research creativity, as the NBAC report called for the NOHRO to have “final authority for enforcement,” although that “function should be shared with federal departments, institutions, and accrediting bodies.”^[7]

Upon the expiration of the NBAC’s charter in November, 2001, President George Bush created a successor President’s Council on Bioethics, with a similar mission. It is charged with “advising the President on

ethical issues related to advances in biomedical science and technology.” Its reports focus on such issues as human cloning, biotechnology, stem cell research, and ethical caregiving. As areas such as stem cell research have become controversial, with the ban on Federal funding of embryonic stem cell research and the passage of a variety of state laws designed to attract biotechnology researchers, human subjects research has faced the danger of politicization and public distrust.^[4]

In addition to the President’s Council on Bioethics, the National Human Research Protections Advisory Committee was created in 2000, to provide advice and recommendations to the Secretary of HHS, the Assistant Secretary for Health, and the Director of the Office of Human Research Protections on a range of issues connected with protecting human research subjects. When its charter expired, the Secretary’s Advisory Committee on Human Subject Research Protections was created in 2002, and still continues to operate. It has been carefully examining all aspects of the Common Rule, as well as considering requiring accreditation and training for IRBs.^[4]

Another pressure on research with human participants is coming from the implementation of the HIPAA. While compliance with the privacy regulations was not required until April, 2003, debate over their impact on medical research had raged since the law was passed. As an outgrowth of nationwide interest in the privacy of medical information, HIPAA’s main concern is not with human subjects research. However, the regulations sometimes do make research using medical records much more cumbersome. In order to protect individuals’ rights to control access to their medical records, these regulations establish much stricter guidelines for access to personal records than the “Common Rule” required. The Biotechnology Industry Organization and the Association of American Medical Colleges were among the groups arguing that the rules for eliminating identifying information are going to make the use of medical records much less meaningful.^[8] However, it can also be argued that the public’s increased concern for privacy needs to be reflected in the IRB system, and in all aspects of human subjects research. As Annas stated, “Public support of medical research is really a function of public trust. Providing meaningful protection of the privacy of medical records in research is an important goal in its own right and will also increase public trust in the entire medical-research enterprise.”^[9]

Additional human research policy issues have been raised by governmental and private agencies. Frequently heard are concerns that IRBs are not supplying adequate oversight and are often pressured to review and approve protocols quickly. Several well-known cases of ethical violations in medical research

resulting in serious adverse incidents have instigated repeated calls for heightened scrutiny and tighter regulation. A 1996 review by the General Accounting Office, among others, concluded that IRBs face serious shortages of staff and financial resources, undermining their ability to provide sufficient oversight to assure human subject protection.^[10] Other reports discussed the changing climate in medical research, which current regulations are inadequate to address, such as multisite research, conflicts of interest arising from privately sponsored research, new issues related to protection of vulnerable populations, and under-representation of women and children in research studies.^[11] The 2003 NIH "Roadmap" explicitly encourages innovative public-private research partnerships and increasing clinical research outside of academic medical centers, raising new questions about appropriate oversight.^[11] At the same time, non-medical university faculty are increasingly rallying to the concept that IRBs have expanded their oversight too far, especially in social and behavioral research.^[12]

The Children's Health Act of 2000 required that DHHS and FDA regulations for research with children be brought into agreement. It also required further study of the adequacy of IRB protection for children in clinical trials. As a result, the DHHS and the FDA issued new regulations during 2001 about the appropriate use of vulnerable populations in studies. While seeking to protect these populations, they are also trying to ensure their representation in studies, so that the results will be applicable to all groups of the population.^[13]

In addition, policy questions continue to arise about the appropriate balance between gathering information for public health purposes and for research. Should different privacy and informed consent standards apply if a county Health Department is gathering information while investigating an epidemic or potential bioterrorism than if it is "only" gathering the information to produce generalizable knowledge? How do we differentiate between public health practice and research, other than by the original intent of the data gathering?^[14] And, what about the concept of "group risk," which would call for IRBs to review research for its possible negative policy consequences for a protected group (such as Native Americans), as well as for the individual research subjects? "Community consultation" when research will disproportionately affect a particular neighborhood, ethnicity or racial group, is seen as one possible approach to identifying and dealing with these ethical concerns.^[15]

Finally, a perplexing policy question concerning the ethical principle of justice in human subject protection has emerged. Whereas justice was initially intended primarily as protection for vulnerable groups easily exploited in subject recruitment, a differing view

looks at justice in terms of access to clinical trials for vulnerable groups. Since the paradigm began shifting in the late 1980s and early 1990s, there has been a growing belief that research can offer real benefits, and the focus on potential benefits has started to over-ride the focus on potential risks. A classic example occurred in the HIV/AIDS community, which demanded opportunities to participate in studies of experimental drugs and protested limited enrollment in these studies, claiming injustice due to the lack of access to potential research benefits. Some cancer studies have produced similar results. The implications for human subject protection from a policy perspective concern the appropriate balance between protection from risk and access to benefits, the potential loss of distinction between research and treatment, and the adequacy of current informed consent standards.^[1] This is especially true when an increasing amount of research is being conducted in settings such as private doctors' offices.

CONCLUSION

Recognizing that many of our most important scientific discoveries and medical advances have resulted from the participation of human subjects in research, the United States continues to evolve its policies for the protection of those human participants. In the process, policy makers are seeking to balance the benefits of the research, to participants and to the world, against potential risks to each individual participant. Our policies seek to maintain the rights of all citizens to be treated ethically in the pursuit of science. To that end, current regulations, promulgated at the federal and state levels, and implemented at the local and institutional levels, aim to provide for the safety and protection of human subjects in research. Because scientific inquiry is a dynamic process, policy makers are attempting to ensure that regulations keep pace with the research they are charged to oversee. Most recently, this has included an emphasis on such areas as medical privacy rights, new genetic technologies and therapies, increased concern for the rights of children, and more stringent review of IRB operations.

Humanitarian Intervention

Michelle Maiese

University of Colorado at Boulder, Boulder, Colorado, U.S.A.

INTRODUCTION

Humanitarian intervention is the threat or use of military force primarily for the purpose of protecting the nationals of the target state from gross and systematic human rights violations. These violations result from either the conscious policies of a central regime or the general breakdown of that regime. The use of force may come in a variety of forms, including economic sanctions, arms embargoes, restrictions on income-generating activities, aviation bans, restrictions on diplomatic representation, and suspension of membership or expulsion from international or regional bodies. The discussion here focuses on the use of military force by one or more outside states to relieve grave human suffering.

OVERVIEW

Controversy surrounding humanitarian intervention arises from widely accepted constraints on the use of force among states. According to international norms discussed below and provided they do not threaten the legitimate claims of other states, sovereign states have a right to pursue their own destiny free from interference. They also have primary responsibility for the protection of their people's lives. Some believe that military intervention, even to protect human rights, denies the rightful autonomy of the state and constitutes an unacceptable assault on state sovereignty.

Others point out that passivity in the face of gross and systematic human rights violations is likewise unacceptable. They suggest that a government that engages in substantial violations of human rights forfeits both its domestic and its international legitimacy. If a state is unwilling to halt serious harm to its people, the principle of non-intervention yields to the international responsibility to protect.^[1] To be legitimate under international law, military action to protect human rights should be authorized by the United Nations (UN) Security Council. Cases of "unilateral" intervention, undertaken by states without UN authority, are especially problematic.

There is a growing notion that the protection of human rights and dignity should be one of the fundamental objectives of modern international institutions. However, because full-scale military operations may

harm or kill many civilians, those who engage in intervention for human protection purposes should be careful to avoid doing more harm than good. The use of military force should produce substantial humanitarian benefits and be exercised according to principles of right intention, last resort, proportional means, and reasonable prospects.

POLICY OBJECTIVES

It seems clear that the issues faced in the 21st century differ from those the world faced in 1945 when the UN was founded. Cold War politics have imposed a brutal check on the political and economic development of many states. The amount of internal war and civil conflict has grown drastically over the last several decades and many countries have weak economic structures and government institutions.

Given the increase in intra-state conflict, the international community is faced with a dilemma: stand by while there is massacre, ethnic cleansing, and genocide; or take sides in civil conflicts, which may only further contribute to fragmentation of the state system.^[1] Furthermore, humanitarian intervention entails military operations that may harm or kill many civilians. To destroy human life for the benign purpose of protecting human rights seems unacceptably paradoxical. Humanitarian intervention may also seem to go against many of our moral intuitions about the conduct of foreign policy. After all, states are typically concerned only with their own security and well-being; and international relations are commonly thought to be first and foremost relations among states and not individuals.

On the other hand, it seems clear that justice and rights protection no longer stop at the border of the nation-state.^[2] When faced with gross human rights abuses, the international community should not accept that state sovereignty automatically trumps human rights claims. Instead, there is a need to balance the principle of state sovereignty against protection of human rights. Policy surrounding humanitarian intervention needs to meet at least four broad objectives:^[1]

1. Establishing clearer rules, procedures, and criteria for determining whether, when, and how to intervene.

2. Establishing the legitimacy of military intervention in those cases where all other approaches have failed.
3. Ensuring that military intervention is carried out for the purposes proposed, is effective, and is undertaken with proper concern for human costs and institutional damages that may result.
4. Helping to eliminate the causes of conflict while enhancing the prospects for a sustainable peace.

STATE SOVEREIGNTY AND HUMAN RIGHTS: A DILEMMA

The principles of sovereignty and non-intervention suggest that states can legitimately use armed force only in cases of self-defense. The international community, including the UN, is prohibited from intervening in matters that are considered wholly within the domestic jurisdiction of states. Article 2^[2] of the UN Charter prohibits the use of force against a state's territorial integrity or political independence and suggests that states have exclusive jurisdiction within their own territory. If the duty not to intervene is violated, the victim state has the right to defend its territorial integrity and political independence. This effectively rules out interference, whether direct or indirect, with a state's political, economic, or cultural elements. It also seems to rule out a legal right to use force against another state even to promote human rights.

For many states, sovereignty is their only line of defense against major powers. The notion of sovereign equality guarantees that despite differences in economic, social, or political structure, less powerful states have the same legitimacy, rights, and duties as the developed Western states, as well as equal membership in the international community.^[2] In general, sovereignty has meant immunity from external challenge and broad discretion with respect to methods of governance. Insofar as it serves as recognition of states' equal worth and dignity, their identity, and their right to self-determination, respect for sovereignty contributes to international stability.

Because the state is the ultimate repository of individual rights, a resolution should be sought within the state itself when states abuse human rights. If the people do not like what their government is doing, it is for them to rise up and reshape that government. When outside states impose their conception of rights on other countries, this may be viewed as a form of moral imperialism or intellectual arrogance. Moreover, even if human rights conditions are awful, an enduring remedy may require fundamental reordering of the whole society and its values; and an outside force is unlikely to be able to accomplish this. There is also a worry that widespread acceptance of humanitarian

intervention will lead aggressive governments to use it as an excuse for their expansionist policies.^[3]

However, others argue that humanitarian intervention does not represent cultural imperialism, but rather reflects the shared rights of humanity. Sovereignty has never meant the unquestionable right of government leaders and officials to do anything they please within their recognized space. Rather, a state's right of self-preservation is subordinate to individuals' rights of self-preservation.^[4]

The fact that a state has been established according to traditional legal norms and has a fixed territory is not enough for legitimacy. Rather, the community grants limited powers to a central governmental authority to serve the interests of that community. Because states gain their legitimacy from the consent of persons, it is unclear that states that abuse human rights and obstruct social justice should be regarded as legitimate. In fact, governments that behave badly or misuse their authority undermine the one thing that justifies their political power and thereby become delinquent within the international community.^[3] They should not be allowed to shield themselves behind international law and the principle of state sovereignty.

While Article 2^[2] of the Charter establishes the norm of non-intervention, other provisions of the Charter list the protection and advancement of human rights as a primary purpose of the UN system. For example, Article 1^[2] of the Charter commits the UN to promoting and encouraging respect for human rights and fundamental freedoms. The Universal Declaration of Human Rights (1948), the four Geneva Conventions, and the establishment of the International Criminal Court likewise set forth standards for state conduct. These agreements and mechanisms have changed expectations about what counts as acceptable state conduct and established a universal jurisdiction concerning matters of human rights. This emerging discourse implicitly recognizes a new kind of accountability and aims to protect oppressed minorities and excluded social groups against the domination of the powerful.^[2]

Insofar as nations have agreed to promote universal respect for human rights and fundamental freedoms, these rights are a matter of international obligation and subject to the supervision of the international community. But does this warrant forceful intervention to secure that such obligations are met? Chapter VII of the Charter suggests that the UN Security Council may pursue economic, diplomatic, or military measures to maintain or restore international peace and security. Because widespread human rights violations create large numbers of refugees and often escalate domestic civil strife that can spill over into other countries, some maintain that such violations constitute a threat to international peace and security. As

the international community becomes more and more connected, states that violate human rights come to pose a risk to people everywhere. According to this view, the UN has a right and a duty to respond to these situations. Passivity in the face of gross and systematic human rights violations is unacceptable.

However, there is no express linkage in the Charter between the maintenance of peace and security and the protection of human rights. While the Charter does include many human rights provisions, it does not outline concrete powers and functions of the UN in promoting and protecting these rights. It seems that even if an intervention is for the purpose of protecting core human rights, it violates Article 2^[2] by suppressing the political will of the target state. On the other hand, an expansive view of security sees it as extending beyond national or territorial security to include the security of individuals against threats to their life, safety, and well-being.^[1] Over the last several decades, the UN Security Council has empowered itself to consider humanitarian emergencies a threat to international peace and security.

International human rights covenants and UN practice have begun to conceptualize sovereignty in terms of responsibility. In signing the Charter, a state takes on a dual responsibility: externally, to respect the sovereignty of other states; and internally, to respect the dignity and basic rights of people within the state. When states are unwilling or unable to do so, this responsibility should be borne by the broader international community. The responsibility to intervene stems from a general duty to assist victims of grave injustice and help them regain their autonomy and dignity.

CRITERIA FOR LEGITIMATE HUMANITARIAN INTERVENTION

Humanitarian intervention is a matter of delivering aid to ordinary people whose lives are at risk because their states are unwilling or unable to protect them. The international community has yet to develop consistent, credible, and enforceable standards to guide state and intergovernmental practice.

Growing practice among states and regional organizations, human rights provisions, and Security Council precedent suggest that the “responsibility to protect” is an emerging guiding principle for humanitarian intervention policy. The responsibility to protect implies an evaluation of the issues from the point of view of those needing support. It acknowledges that primary responsibility rests with the state concerned, but suggests that if the state is unwilling or unable to fulfill this responsibility, it becomes the responsibility of the international community to act in its place. This raises questions about legitimacy, authority, and operational

effectiveness. The use of military force for human protection purposes should be guided by the principles listed in [Table 1](#).

Most turmoil within states does not require coercive intervention by external powers. The use of military force for human protection purposes should occur only in exceptional and extraordinary cases: situations of genocide, ethnic cleansing, forced expulsion or “disappearance,” enslavement, and widespread and systematic acts of terror or rape. Situations of state collapse, mass starvation or civil war, or overwhelming natural or environmental catastrophes might also be included. Actions that fall short of outright killing, on the other hand, may not warrant military intervention. This includes cases of systematic racial discrimination or political repression.

In those cases where state action (or inaction) “shocks the conscience of mankind,” military intervention should be guided by the principle of right intention. This means that the central purpose of the intervention should be the ending of gross human rights abuses and the restoration of peace. Because some level of self-interest may be required to justify expense of resources and troops, intervening states are likely to have mixed motives. In addition, there is often a gap between stated purposes and actual motivation. However, such cases should not be used as a rationale for abandoning the practice of humanitarian intervention altogether.^[3]

There are various ways to ensure right intention. First, intervention should involve multilateral rather than unilateral state action. Second, those in need of help should welcome and support the intervention. Third, other countries in the region should support the actions taken.^[1] These conditions reflect the general belief that interventions to safeguard commercial property or ideologically friendly regimes are impermissible.

Military intervention to protect human rights should be used only as a last resort, after all avenues for peaceful resolution of the crisis have been tried. Before sending troops into harm’s way, endangering local civilians, and spending valuable resources, leaders have an obligation to attempt other peaceful alternatives. This includes negotiations, economic pressure, peacekeeping, pressure from regional organizations, international legal bodies, and other diplomatic efforts. In addition, all reasonable local remedies should be tried before calling on the international community for assistance. The people of the region should have a voice and accountability in negotiating solutions to humanitarian crises.^[2]

In addition, the means used in humanitarian intervention should be proportional and limited to what is required to protect human rights. Foreign troops should not occupy the invaded territory longer than necessary, demand favors from a newly established

Table 1 Criteria for just humanitarian intervention

Just cause	Large-scale loss of life, with genocidal intent or not; or ethnic cleansing, whether carried out by forced expulsion, acts of terror, or rape. These atrocities may be actual or apprehended, and the product of either deliberate state action or inaction.	This excludes violations that fall short of outright killing: systematic discrimination, imprisonment, or political repression.
Right intention	Primary purpose must be to halt or avert human suffering. This is best assured by multilateral operations that are supported both by regional opinion and the victims.	This excludes the overthrow of regimes, the alteration of borders, or the advancement of ideologies or economic goals.
Last resort	Every non-military option for the prevention or peaceful resolution of the crisis must be explored; and gross human rights violations must be imminent or actual.	This excludes use of military force before negotiations, economic pressure, and other diplomatic avenues have been tried; or there are reasonable grounds to suspect such efforts would not succeed.
Proportional means	The scale, duration, and intensity of the intervention should be the minimum required to protect human rights. The effect on the country's political system should be limited.	This excludes military operations that result in massive civilian deaths, lengthy military occupations, and the use of destructive modern weaponry.
Reasonable prospects	There must be a reasonable chance of success in halting human suffering; consequences of intervention should not be worse than the consequences of inaction.	This excludes cases where protection cannot be achieved, or where intervention is likely to escalate or trigger a larger conflict.
Right authority	The UN Security Council is the most appropriate body to authorize intervention. Its authorization should be sought prior to any military action being taken. If the Security Council fails to act, the matter of intervention may be considered by the General Assembly or regional organizations.	Unilateral action by states is prohibited by international law; however, emerging state practice suggests that states may take unauthorized action in certain cases of extreme necessity.

Source: From Ref.^[1].

government, or seek to dominate the targeted country. Intervention should preserve the territorial integrity of the target state and interfere with the ruling structure only as necessary so as to promote an enduring peace. Whenever possible, military action should be directed not at the entire nation, but rather at those responsible for wrongdoing. Intervening states that contribute more to the deaths of innocents than the aid of the oppressed violate this principle of proportionality.

For states to engage in military action, there should be reasonable prospects of halting or averting human rights abuses. Intervening states need to calculate the damage that may be done to the target society and consider the possibility that the intervention will trigger a larger conflict. If humanitarian intervention leads to further escalation and war, it is likely to do more harm than good.

Note that humanitarian intervention differs from conventional warfare. Rather than seeking to defeat an enemy, it aims to protect and rescue populations. This calls for a new type of military operation, one that is preceded by preventive actions and followed by post-conflict rebuilding. The operational procedures used

should promise quick aid to those under attack and reflect the principle of proportionality. Forces should uphold military law governing the use of force and refrain from using destructive modern weaponry. Because the use of military power may lead to further human rights abuses, quick success through surprise or the use of overwhelming force may not be feasible. There is need for “incrementalism” with respect to the intensity of operations and “gradualism” with respect to phases of the operation. The use of military force should be carefully tailored to the objective of protecting human rights. Finally, intervening military forces should collaborate with civilian authorities and humanitarian organizations to bring assistance to populations at risk. This is the best way to ensure an effective intervention.

THE IMPORTANCE OF UN AUTHORIZATION

Many believe that to be legal and permissible, military action against a sovereign state requires UN authorization. Under the UN Charter, the Security Council has

primary responsibility for peace and security matters. Chapter VII of the Charter suggests that when the Security Council considers non-military measures to be inadequate, it may take military action to maintain or restore international peace and security. The Security Council has expanded the traditional conception of what constitutes a “threat” to peace so that human rights violations are increasingly on the agenda.

Reliance on the Security Council for authorization establishes a legal framework by which humanitarian intervention can and should be conducted. Collective intervention endorsed by the UN is widely regarded as legitimate because it is duly authorized by a representative international body. The Security Council is the principal institution for mediating power relationships and consolidating the authority of the international community. Advantages of relying on the UN include its universal membership, political legitimacy, administrative impartiality, convening and mobilizing power, and expertise.

Many believe that the UN is ineffective and point to inherent limitations in its capacity to conduct interventions. First, some question the democratic legitimacy of the Security Council and suggest that it does not have broad enough representation. The founders of the UN were not interested in creating an ideal system of collective security in which all states would participate equally.^[4] Instead, special responsibilities and privileges were given to the most powerful states. As a result, any of the Permanent Members can use their veto power to override the majority on matters of grave humanitarian concern. This sometimes leads to inertia on the part of the UN.

The UN does not have its own military force or the resources needed to carry out humanitarian intervention. Nor does it have facilities for the training of officers and troops in rules of engagement, command and control, or civic reconstruction. When the UN decides to deploy forces, they must be hastily recruited, and forces from different countries rarely have the opportunity to train with each other. It is likely that the UN will continue to authorize states to deploy forces under their own command in support of Security Council resolutions.^[4]

One alternative to Security Council authorization is to seek support for military action from the General Assembly in an Emergency Special Session under the established “Uniting for Peace” procedures. While the General Assembly lacks the power to authorize military action, it could help to legitimize an intervention that has taken place and put pressure on the Security Council to rethink its position. A General Assembly resolution would engage the views of a wide range of states to determine whether intervention was warranted. However, a General Assembly recommendation for military action still requires approval from the Security Council to be fully legally legitimate.

THE QUESTION OF UNILATERAL INTERVENTION

In cases where the Security Council fails to act, states may be inclined to conduct an intervention on their own initiative. Unilateral intervention has both prospects and problems.

If unified Security Council action is not possible, human rights imperatives will be pitted against the Charter’s rules governing the use of force. It seems we must choose between damage to the international order if the Security Council is bypassed or the slaughtering of human beings while the Security Council does nothing.^[1] If the Security Council cannot uphold its responsibility to protect, unilateral action by states becomes more likely.

However, without the discipline and restraint of the UN, such interventions may not be conducted for the right reasons or in accordance with the proper precautionary principles. Some believe that discounting UN restrictions on the use of unilateral force guarantees the legitimization of barbarism in the name of human rights. There is a danger that the stronger powers will assert a new “duty” or “right” to assert “global leadership” on behalf of the world’s vulnerable. Unauthorized humanitarian intervention poses a threat to the international constraints on the behavior of states and does serious damage to the UN’s reputation and authority. Many believe that intervening states do not really intend to change international law, but rather to create new, exceptional rights for themselves. Providing an exception for a powerful state to violate the rules that continue to apply to all other actors severely undermines respect for international law governing the use of force.^[5] The international legal system has a stake both in prohibiting unilateral intervention and preventing crimes against humanity.

Some point to the evolution of customary law and emerging state consensus as a legal justification for unauthorized humanitarian intervention in rare and exceptional cases.^[6] Such instances of “extreme necessity” arise when there are extremely severe violations occurring, force is necessary to stop immediate harm to civilian populations, and humanitarian intervention is indeed the lesser wrong.^[7] There should be widespread consensus that a situation of extreme necessity has in fact arisen, and states should proceed cautiously. Although the UN Security Council has not authorized action, the intervening states should maintain a close relationship with the council.

The intervention should be motivated primarily by humanitarian purposes, involve a coalition of states, and be welcomed by the population bearing the brunt of the atrocities. The consequences of the intervention should be more in keeping with the intent of the law than what would have ensued if no action had been

taken.^[7] This emerging consensus can help states to find a balance between what is lawful and what is right.

CONCLUSION

Military intervention for humanitarian purposes is controversial both when it happens and when it fails to happen. While there may be significant values of human dignity and justice advanced by intervention, there are also competing values favoring orderly and non-forcible resolution of such situations.^[4] It seems clear that the tension between UN authority to address human rights issues and the demand that it not interfere in the internal affairs of states has been resolved to some extent by an expansive view of peace and security. This expansion raises questions for the future. Will this expansive view of “threats to peace” unleash a new era of just wars? Is the international community seeing a return to warfare “for the right reasons” that it may ultimately regret? Will the Security Council act merely as a tool of imperialism and colonialism, dominated by the most powerful nations?

Military intervention should always remain an option of last resort. However, when humanitarian intervention is required, it should reinforce the collective responsibility of the international community. National leaders should collaborate to mobilize both domestic and international support for intervention, and the UN should respond with timely authorization.

Finally, it is important to note that policymaking has focused almost exclusively on international reaction human rights violations. Little attention has been paid to the prevention of catastrophe or the need for peace building after abuse has occurred. To genuinely protect human rights, the international community

should focus its attention both on conflict prevention and post-conflict rebuilding.^[1]

Impacts of Bureaucratic Reform on State Government Administration

Brendan F. Burke

*Department of Political Science, Bridgewater State College,
Bridgewater, Massachusetts, U.S.A.*

INTRODUCTION

State-level reform has taken several active paths during the past decade. This entry describes three distinct but potentially compatible directions for state reform—the enhancement of internal management subsystems, the movement toward a results orientation in agencies, and the expansion of customer and stakeholder accessibility to the functions of government via on-line technological advancements. For each reform line, this entry offers context and definition, specification of systems or process changes, and assessment of analytic endeavors to contrast state progress. State rankings on these reforms are compared, and a discussion of the measurement of potential outcomes of reform is initiated.

STATE LEVEL EFFORT AT ADMINISTRATIVE REFORM

Recent progress in state administration builds on a solid foundation of institutional advancement during the second half of the twentieth century. Since 1950, the states have acted to streamline organizations, update procedures, enhance the strength of institutions, and reduce the prevalence of independent authorities and commissions.^[1] At the end of the century, the subnational level proved to be the most active in “reinvention”—the reorientation of policy and administrative systems toward concern for customer satisfaction and enhanced results.^[2] The federal system facilitates a healthy competition across like units of government, wherein the 50 states view at least a comparable subset as competitors. The states strive not only to enhance conditions for their own citizens, but also to demonstrate their comparative advantage with regard to other states, or to leave their inferior status behind and climb up the ranks.

Table 1 displays a comparison in rankings for the most and least successful states on three different reform trends. Each trend, as well as a current measurement process and details of implementation, is discussed in turn. The table shows that certain states are

successful under multiple definitions of reform, and that others rank poorly on multiple measures. However, certain states focus their reform efforts more narrowly, with leadership concentrating only on certain techniques (and for those at the lowest rankings, neglecting only certain narrower bands of reform option).

THE REFORM OF INTERNAL MANAGEMENT SUBSYSTEMS

Light^[3] contends that reforms are like the tides—varying in force over time and potentially cyclical in nature. The historic focus of Light’s “scientific management” tide is the enhanced efficiency of administrative systems as a precursor to the best direct service delivery processes. Early advocates, such as Luther Gulick, recognized the public administration specialist as the appropriate actor to ensure public management effectiveness and efficiency. In 1997, the Pew Charitable Foundation granted funds to Syracuse University’s Maxwell School of Citizenship and Public Affairs to pursue the Government Performance Project (GPP), an effort to measure managerial performance at the federal, state, and local levels. The study results are displayed prominently on the project’s web page^[4] and through special issues of *Governing* magazine.

The management philosophy underlying the GPP is as follows: Government performance is a function of the cohesiveness and coherence of policy implementation efforts. But an important precursor of implementation is the strength of staff or administrative processes. Public management is seen as a kind of “black box” involved in the translation of government resources into varied direct results. Successful management includes an effective oversight of personnel, financial, planning, and information technology “subsystem” capabilities. In addition to these separate internal service functions, the integration of all four comes through the contemporary emphasis on “managing for results”.^[5] The unifying strand of the GPP model is a focus on enhancing the capacity of executive leadership and other top management to

Table 1 Comparison of state rankings on alternative reform orientations

Rank	Internal management subsystems ^a	Results or “reinvention” ^b	Accessibility via e-government
1	Michigan	Michigan	Indiana
2	<i>Utah</i>	<i>Florida</i>	Michigan
3	<i>Washington</i>	Georgia	Texas
4	Delaware	Oklahoma	Tennessee
5	<i>Iowa</i>	<i>South Carolina</i>	<i>Washington</i>
6	Kentucky	<i>Ohio</i>	California
7	Maryland	Oregon	New York
8	Missouri	<i>Virginia</i>	Pennsylvania
9	Pennsylvania	<i>Iowa</i>	<i>Florida</i>
10	<i>South Carolina</i>	<i>Utah</i>	<i>Ohio</i>
11	<i>Virginia</i>	<i>North Carolina</i>	<i>North Carolina</i>
40	Alaska	Alaska	Alaska
41	<i>Arkansas</i>	<i>Mississippi</i>	<i>West Virginia</i>
42	<i>Connecticut</i>	New Hampshire	<i>Mississippi</i>

make well-informed choices and to disseminate them promptly throughout the organization.

The GPP assigned letter grades on an “A”–“F” scale for achievement on each of the five management subsystems, and a summary grade. The grades represent an accretion of effort mostly during the 1980s and 1990s—not an evaluation for a given time unit. But because the state survey was reported in 1999 and 2001, there is some evidence of rising, steady, and falling performance at the turn of the century. The following are examples of “top-grade” activity within each of the categories:

1. Human resource management: Leading states consolidate job categories, where possible, in the civil service system; use prompt hiring and vacancy review processes; provide pay-for-performance systems; and practice long-term human resource planning. This can include an assessment of future human resource

needs—both the potential types of jobs and responses to hard-to-serve markets within the state. Human resource management remains a relatively weak internal function overall for the states—only three received an “A” or “A–” grade in 2001 (South Carolina, Washington, and Wisconsin), and the average state grade was “B–”.

2. Financial management: Successful states use broad budget authority so that appropriations can be flexibly matched with agency-spending needs; emphasize cost accounting and enterprise fund use; provide effective policies for investment and maintenance of fund balances; perform long-term revenue and expenditure forecasting; and stipulate performance-based contracting rules. Ten states received an “A” or “A–” grade in 2001, providing evidence that this is a relatively strong internal focus (average grade: B).

3. Information technology management: Powerful chief information officers are present to coordinate technology needs; to bridge statewide and agency plans; to optimize the use of the Internet for state web sites; and to ensure quick turnaround in technology replacement plans so that systems are current in a rapidly changing field. This is an improving subsystem, but still with some room for enhancement. The 1999 average grade was “C+” and the 2001 grade was “B–”.
4. Capital management: The capital plan is not “one year of reality and four years of fantasy;”^[6] the future needs are well prioritized and will be implemented to schedule; and the management of maintenance and operations funding is an adjunct to the construction of projects. The states were relatively successful at this management function in the initial GPP study, but there has been some decline since then. Nine states received “A” or A–” grades in 1999, but the number fell to five in 2001. The average grade remained a “B–” across the two studies.
5. Managing for results: The leading states pursue strategic planning between legislatures and agencies; effective performance measures are used in most agencies; performance is compared across agencies and across comparable states in benchmarking programs; and state auditors ensure the effectiveness and accuracy of performance information. Only five states received “A” or “A–” grades on this integrating reform in 2001, with an average grade of “C+”.

THE RESULTS ORIENTATION

Although internal subsystems reform has brought greater efficiency and an enhancement of managerial capacity, it neglects an important determining point for the quality of governmental effort—the transaction between the government and the service user or recipient. “Street-level” bureaucratic effort may benefit from better managerial guidance, information, and control of resources, but it serves also to benefit from enhanced flexibility in decision making and allocation of resources. In Light’s vocabulary, this is the “liberation management” tide, but the most common moniker for this movement is “reinventing government.” The Winter Commission Report, *Hard Truths/Tough Choices*, and Vice President Gore’s National Performance Review (NPR) documented the problems and the possibilities for reinvention at the subnational and national levels, respectively.^[7,8] During the past decade, the most salient theme of reinvention has been the movement from government dialog away from processes, and toward service results.

The American State Administrators Project (ASAP) survey includes questions that track the prevalence of specific “reinvention features” underlying the results-oriented reform wave. Based at the University of North Carolina at Chapel Hill, with funding from the Earhart Foundation, the survey has been performed twice each decade since the 1960s, including inquiries about reinvention in 1994 and 1998. State agency heads respond to the mail survey, making ASAP a valid and expert-based source of knowledge about various trends across American state governments. For a full description of the ASAP survey and its methodology, see Ref.^[9]

Eleven features of reinvention were included in the survey, with the request that the respondent indicate a degree of implementation from “no consideration” to “full implementation” of the different reinvention possibilities (Table 2). A primary difference between the ASAP and GPP studies involves the unit of analysis. The GPP developed state grades on the internal management subsystems, whereas the ASAP results tracked agency activity and breadth of implementation across all states. Here, the findings describe the prevalence of the reform technique, without a detailed analysis of a state-specific nature. The state ranking in Table 1 was developed from the summation of results gained from the agency heads within each state, deleting California from the ranking because of a low response rate.

The ASAP inquiry gained information about the scope of reinvention across three of the same four categories as the NPR: reducing regulation by cutting red tape (reinvention features 8, 10, and 11); empowering employees (3, 6, and 7), and refocusing on the customer (1, 2, 4, and 5). The NPR focus on “cutting back to basics” is probably better served at the state level through the requirements for balanced budgets. Contracting out may be downplayed in this summary of reinvention techniques, but elsewhere in the ASAP survey, it is reported that 72% of state agencies contract out some services to private companies, non-profit agencies, or other governmental units.

ACCESSIBILITY REFORMS VIA E-GOVERNMENT

A third reform trend has quickly gained stature in the twenty-first century. Light contends that the tides of reform can overlap one another, and this is certainly the case with state-level e-government initiatives embracing the Internet. (For an assessment of governmental techniques underlying E-government, see Ref.^[10]. For a more theory-based assessment, see Ref.^[11].) States, through the use of the World Wide Web, have enhanced customer access to governmental services

Table 2 Progress on reinvention in the American States—Agency implementation levels for specific reinvention features, 1998

Reinvention feature	Percent of agencies	
	Partially implemented	Fully implemented
1. Strategic planning to produce clear mission statements	37	50
2. Training programs to improve customer service	54	29
3. Quality improvement programs to empower employees	56	23
4. Benchmarks for measuring outcomes	49	24
5. Systems for measuring customer satisfaction	45	19
6. Decentralization of decision making	42	18
7. Reduction in hierarchical levels	23	21
8. Greater discretion in procurement	33	13
9. Simplification of human resource needs	27	7
10. Privatization of major programs	17	7
11. Greater discretion to carry over funds	14	8

Respondents are agency heads asked: "From time to time, state agencies undertake to change the way they do things. Please indicate the extent to which your agency has implemented each of the following changes in the 1990s." Responses range from "no changes considered" to "fully implemented" ($n = 1075$).

and have enhanced the citizens' ability to understand and affect governmental processes. As a reform tide, accessibility enhancement unites the results orientation with a portion of what Light calls the "watchful eye." Earlier legislation under this tide included the Administrative Procedures Act of 1946 and various "sunshine" laws around processes such as public hearings. Citizen access, to be heard by a large number of

governmental actors via e-mail and to read primary documents and databases, has been made much easier via the e-government focus. The Internet is rapidly becoming the facilitator of informed participation.

The accessibility reforms did not arise because of a specific problem; instead, some potential problems could now be treated because of new technology. The Washington State home page on the Internet (Fig. 1)

**Fig. 1** The Washington State home page.

immediately shows the enhanced value for the government's customers and interested citizens. Citizens have immediate and easy access to a number of services, including the renewal of vehicle licenses and payment of child support. The accesswashington site also shows how it may serve "watchful eye" interests, with information links to the state legislature and contract bid processes. Within the state legislature link, one can track legislative actions, their history, and their sponsors.

Darrell West, director of the Taubman Center for Public Policy at Brown University, studied a variety of characteristics of state effort underlying their Internet presence through surveys in 2000 and 2001. At that time, all states except Wyoming provided a variety of services on-line, including the filing of taxes, purchase of vehicle registration and hunting licenses, and the purchase of governmental documents. Forty-eight of 50 states enabled secure access for on-line transactions. All states had some web sites with disability access features, but in some cases, the percentage of accessible sites was low. Between the surveys in 2000 and 2001, West found that most states improved their Internet presence in these service areas and their on-line administration. West ranked the states on their implementation of these citizen services based on the following criteria: user accessibility, interactivity, and ease of use in both years; the 2001 rankings are reported in Table 1.^[12]

MEASURING THE IMPACTS OF REFORM

Many of the intermediate impacts of bureaucratic reform have been specified to this point—public administration techniques bring about improvement and change to administrative systems. But what of the ultimate impacts of reform? More specifically, in what ways have state government reforms improved the status of the citizens? The transaction-enhancing nature of the results-oriented and accessibility-based reforms is too situational or contextual to aggregate into summary measures. One common goal of both the results-oriented and accessibility-oriented reforms is the enhancement of citizen trust in the government. There is situational evidence of the contrasting possibilities regarding this goal and the reform effort. Michigan and Florida are two states with high rankings on both their "reinvention" and e-government initiatives. In Florida, overall trust in the government has risen along with reform implementation; in Michigan, reform implementation does not correlate with higher trust in the government.

The impact of the internal management subsystem reforms is more readily analyzed because of their nature as an intervening variable on the path toward better governmental results. If the GPP grades can be

considered a correlate of the "scientific management" movement, then they should illuminate efficiency gains within government processes. One way to test this is to link the GPP grades and a measure of financial strength—the state bond rating from Standard & Poor's (S&P). Bond ratings constitute a relatively stable factor that affects the cost of governmental debt issues. Small reductions in the interest rate for debt issuance, which correspond to the reduced investor risk of a highly rated governmental entity, can save that government many millions of dollars on a large bond issue. The GPP and S&P measures, when converted to rank order, have a relatively strong 0.50 correlation (0.01 statistical significance). The tie between GPP measures and bond ratings indicates an efficiency impact directly beneficial to citizens within the internal subsystem reforms.

CONCLUSION

During the 1990s and into the twenty-first century, the states have been active implementers of a variety of reform types, designed to enhance efficiency and responsiveness, and to reduce the psychic distance between government agents and varied stakeholders. The intermediate administrative impacts are clear with the types of improvement introduced by state leadership and bureaucracies. The ultimate or substantive impact is clear on internal subsystem reforms, but is harder to track on transaction-based reform tools and techniques. The measurement of service outcomes is a growing advancing area. With effective measures for the results of the myriad of governmental activities, there may prove to be an acceptable method to aggregate these to a higher level, thus giving us a comparative basis across the waves of administrative reform.

Impasse Resolution Procedures

Gary E. Roberts

*School of Global Leadership and Entrepreneurship, Regent University,
Virginia Beach, Virginia, U.S.A.*

INTRODUCTION

The collective bargaining process frequently results in an impasse, an inability to reach an agreement on one or more issues under dispute between labor and management. The objective of this article is to describe the various impasse resolution strategies typically employed to resolve labor disputes as well as their respective strengths and weaknesses (Table 1).

The exact timing of a formal impasse declaration varies according to federal, state, or local labor laws. In some situations, there are well-defined dates to reach an unaided settlement, after which an impasse must be declared. In other settings, the law is silent or ambiguous as to when an impasse must be declared and is left to the discretion of labor and management based upon their bargaining history and prevailing practice (how labor and management customarily resolve disputes). An impasse can also be declared at any time in the bargaining process when the differences between the parties are of such a magnitude that future negotiations are deemed hopeless.

Once an impasse is reached, there are a variety of impasse resolution procedures to aid labor and management in overcoming their differences. They include mediation, fact finding, arbitration, and their variants, such as med-arb. The federal government and 38 states have legislation supporting some type of impasse resolution procedure, with mediation being the most common (36), followed by fact finding (33) and arbitration (30).^[1]

FUNDAMENTAL LABOR RELATIONS PRINCIPLES

A fundamental tenet of the collective bargaining process is that the most equitable settlement is crafted by the parties. As such, impasse resolution techniques are designed to encourage both parties to reach a voluntary agreement before the imposition of a settlement by a strike or lockout or through the actions of a third party, such as the government. Strikes are permitted in the private sector, but only 11 states permit public employees a limited right to strike.^[1] Strikes impose serious costs on labor and management while

disrupting production and service delivery to the public. Conversely, research demonstrates that dispute resolution costs are higher in jurisdictions that fail to provide finality through the right to strike.^[2]

A common misconception regarding labor disputes is that when parties reach an impasse, they disagree over many issues. In most cases, labor and management dissent over a few key bargaining areas. The specific disagreement areas that trigger an impasse vary dramatically from one situation to another, but certain subject areas prompt more disputes than others. The most frequently contested area entails wages and other compensation practices such as longevity pay, merit pay, and employee benefits. Common non-monetary issues include disputes over job security, such as outsourcing, promotion practices, and working conditions, among others.

MEDIATION

When a stalemate is reached, the typical first dispute resolution technique employed is mediation. A mediator is a neutral third party who attempts to restart direct talks between labor and management to facilitate a voluntary settlement. Full-time mediators employed by federal and state governments receive specialized training and are certified by professional organizations. The expertise of ad hoc mediators varies significantly, and their use has uncertain, and sometimes negative, outcomes. There is no formula for success as a mediator given the multitude of variables that influence any single impasse situation. General personality traits associated with success include problem-solving ability, tact, diplomacy, patience empathy, and clear communication skills.^[3]

Mediators employ three strategies based upon their analysis of the situation.^[4] A reflexive approach entails meeting the parties separately to develop an understanding of the disputed issue(s), the parties' positions on each issue, how each side views the other, and identification of the actors with the power to approve or reject a settlement. The non-directive approach attempts to create a climate more conducive to reaching a settlement and to help labor and management become more effective at crafting an agreement.

Table 1 Advantages and disadvantages of impasse resolution procedures

Procedure	Advantages	Disadvantages
Mediation	Flexibility Encourages creativity	Scarcity of skilled mediators Absence of finality
Fact finding	Increases pressure for settlement Formal record maintained	Absence of finality High economic cost
Conventional arbitration	Finality, no strike Decisions are usually binding	High administrative cost Chilling and narcotic effects High settlement costs “Split-the-difference” tendency Delegation of budgeting authority
Final offer arbitration	Finality, no strike Decisions are usually binding Reduces rate of unreasonable offers	High administrative cost Chilling and narcotic effects Chance of unreasonable settlements Illegal delegation of budgeting authority

This frequently entails an educational process in which the mediator outlines the causes and consequences of an extended bargaining impasse. In addition, a mediator may suggest potential solutions or trial balloons that provide novel means for solving the impasse. For example, if the major issue at dispute is a wage increase, the mediator may suggest greater employer pension contributions in lieu of a large salary increase. The final strategy is a directive approach, in which the mediator takes an active role to craft a settlement. This is accomplished by directly proposing a settlement and pressuring the parties to agree, in essence, taking control of the process. Skilled mediators use one or all of these approaches depending on the competency and motivation levels of labor and management negotiators and external factors such as economic or political conditions.

The advantages of mediation include its flexibility, economy, lack of a written record thereby encouraging creativity, ability to educate inexperienced parties, and adherence to the voluntary settlement principle.^[1] The desirable characteristics of mediation can be a serious liability in other situations. For example, the absence of a terminal process makes the outcome of mediation uncertain, because the mediator cannot force a settlement. For mediation to be effective, the mediator needs to be skilled and experienced, qualifications that are in scarce supply.

FACT FINDING

The next level of impasse resolution is fact finding, which is more common in the public than the private sectors. Fact finding is a formal, quasi-judicial process in which a single fact finder or a panel of fact finders hears 1 or 2 days of formal testimony from labor and management on the disputed issues. A transcript of the hearings is sometimes produced. States such as Florida mandate that a collective bargaining impasse

situation culminate in fact finding, while in other states fact finding is voluntary upon the agreement of both parties. There is significant variability in how the fact-finding session is conducted. Some fact finders engage in mediation prior to issuing a decision by informally meeting with the parties and encouraging a voluntary settlement, while others take a more legalistic approach and simply hear the case. There is significant variation in the outcomes of fact finding in terms of the recommendations and the degree of public scrutiny. In some instances, fact finders offer no formal recommendations, while in others, detailed recommendations are issued. Clearly, fact finding absent a formal recommendation differs little from mediation. In terms of public review, in some instances, fact-finding decisions are public record and are widely publicized in the media, while in other settings the recommendations are not released to the public. There is disagreement on the value of public disclosure, with proponents arguing the force of public opinion encourages a settlement, while other observers claim that most labor disputes command little public interest except in a strike situation.^[1]

What criteria does a fact finder use to make decisions? Typical criteria include wage comparability in the local labor market area, the organization's fiscal health and ability to pay, changes in the cost of living, local labor market conditions, and prevailing practice (what most other employers provide or mandate) in terms of working conditions and work rules.

What are the main advantages of fact finding? Fact finding provides an opportunity for parties to reflect on their positions and reduce tensions and anger. It also provides additional negotiating time and can provide “cover” for one or both parties to make concessions that would result in considerable resistance or controversy if a settlement was voluntarily reached. Skilled fact finders can mediate the dispute, resulting in a voluntary settlement during negotiations. The negative aspects of fact finding revolve around its absence of finality given its voluntary nature.

Empirical studies of fact-finding effectiveness have found mixed results with relatively low settlement rates after the issuance of a reward.^[1] Evidence from a large-scale study in New York found that fact finding becomes more successful with a formalized adjudicative (courtroom) structure in contrast to the less successful accommodative (informal) approach.^[5]

ARBITRATION

Binding arbitration is the final common impasse resolution technique. Our focus is on interest arbitration, which entails issuing a decision on the terms of a collective bargaining contract vs. grievance arbitration, which addresses disputes over the interpretation of an existing contract. However, grievance arbitration disputes can enter interest arbitration decisions if they become part of an effort to change or reinterpret the contract. For example, if there are numerous grievances on forced overtime provisions, one or both parties may reach an impasse over contractual language changes. The main benefit of binding arbitration is the closure provided and its avoidance of a strike or lockout. In states with binding arbitration, the incidences of strikes are reduced when compared to statutory prohibitions.^[1]

Arbitration is mandated by legislation for certain categories of public safety employees, such as police and firefighters in states such as Pennsylvania, while in other circumstances, the parties may voluntarily agree to the use of binding arbitration as the terminal conflict resolution procedure. Successful arbitrators are typically highly educated professionals, such as lawyers and college professors. There is a professional organization of labor arbitrators, The American Arbitration Association (AAA), that certifies the qualifications of arbitrators and provides lists of its members to those interested in employing the service of an arbitrator. The most experienced arbitrators conduct the majority of arbitration hearings, given labor and management's interest in having a skilled and seasoned neutral with a proven track record hear their case. Arbitration awards are published by commercial publishers, thereby providing an opportunity for labor and management to research an arbitrator's case history. Unions and management strive to select arbitrators that issue fair, balanced, and well-reasoned decisions.

Larger employers and unions may have a panel of arbitrators hear their case, while smaller employers typically select a single representative. In some industries, union and management contract with an arbitrator to be the exclusive third-party neutral to hear interest and grievance arbitration cases. The advantage of having the same arbitrator is the increased knowledge and understanding gained by the arbitrator

regarding the industry, bargaining history, and economic conditions surrounding the collective bargaining environment. There are a variety of approaches in arbitrator selection. A common strategy is to request a list of names from the AAA, typically 10 arbitrators. Management and labor alternately strike off names until the required number of arbitrators is left.

Most arbitration hearings are conducted in a quasi-judicial manner with sworn testimony, transcripts, and cross-examination permitted. Frequently, union and management are represented by attorneys. Each side presents detailed evidence supporting its position along with voluminous documentation from research studies, prior arbitration decisions, and records of the collective bargaining process that demonstrate the intent and meaning of the respective parties. After hearing the details of the case, the arbitrator issues a written and binding decision. As is the case in most collective bargaining situations, the issues at dispute are limited, narrowing the scope of the arbitrator's decision. In most cases, the only appeal of an arbitration ruling is to the courts, but the standard of review is high in many states and requires a violation of the authorizing statute or a procedural or due process error. Courts are reluctant to overturn an arbitration decision absent a compelling and unremediable error that damages one or both parties and clearly violates case or statutory law.

CONVENTIONAL ARBITRATION

There are several variants to the arbitration process. Conventional arbitration permits the arbitrator wide discretion in crafting a settlement. This places a heavier burden on the arbitrator's analytical and legal-reasoning skills. For example, if the union is asking for a 10% wage increase and the management is offering 5%, the arbitrator operating under a conventional arbitration process could split the difference (a 7.5% raise). If the information submitted warrants a different wage increase from a simple compromise, the arbitrator is free to settle on an alternate figure usually supported by a detailed economic or equity justification. Arbitrators vary in their inclination to mediate, as some encourage the parties to settle voluntarily even after the hearing is conducted and before a ruling is issued, while others make no attempt to reconcile the bargaining positions. There is a variant of arbitration that formally incorporates mediation into the arbitration process and is called med-arb. The parties choose a mediator, and if a settlement cannot be reached, the mediator assumes the arbitrator's role.^[1]

As with fact finding, arbitrators typically utilize well-defined decision rules in making awards. These include wage and benefit comparability, fiscal impact

on the employer including the ability to pay, and industry or sector prevailing practice regarding working conditions and work rules. Union and management typically present detailed wage and benefit surveys to support their contention that their proposals are reasonable. Detailed budgetary information on revenue and expenditures supports fiscal capacity and impact arguments. The financial impact of the settlement on staffing and service levels is another common information source.

FINAL OFFER ARBITRATION

Conventional binding arbitration has been criticized for permitting arbitrators to simply split the difference and not consider the broader economic or policy considerations. If the union believes that the arbitrator will compromise, they are more likely to present a large wage increase and hope that the arbitrator will provide half of a much larger “loaf.” This compromise may impose serious financial burdens on the employing organization.

As such, states such as New Jersey have instituted a variant of conventional arbitration, final offer arbitration.^[6] In final offer arbitration, the arbitrator must select the complete package of labor and management with no alternations. The theory behind the final offer approach is that the threat of having the other parties’ package selected in total reduces the incentive to present unreasonable proposals and have the arbitrator select a compromise position.^[7,8] A variant of the final offer by package approach is a final offer arbitration on an issue-by-issue basis. Each side presents their final offers on each disputed issue, and the arbitrator must select the union’s or management’s final proposal without alternation. Hence, the final offer by issue approach provides more flexibility for the arbitrator and reduces the probability of forcing an arbitrator to choose between final offers that contain unreasonable demands from both sides. For example, in the typical final offer approach, management could demand an unreasonable benefits reduction, while the union package could contain a huge wage increase. This enhanced flexibility, however, reduces the deterrent impact of having the arbitrator reject your complete proposal and select the other side’s.

ARBITRATION CRITIQUES

Arbitration is attacked on a number of fronts. The first critique is the cost involved. Direct costs include the fees charged by arbitrators, the research and proposal development costs, the costs of presenting the proposal, and the time spent analyzing and interpreting

the final settlement. Complex arbitration cases can run into the tens of thousands of dollars.

Another arbitration critique is that the process illegally delegates budgetary authority to an unaccountable third party, an arbitrator. Adherence to arbitration awards can require tax increases, service cutbacks, or layoffs that are not approved by the electorate or the legislative branch. On the basis of this illegal delegation of authority argument, several states forbid binding arbitration. Related to this is the argument that arbitrators place excessive weight on wage and benefit comparability without a complete analysis of the municipality’s fiscal health and ability to finance a settlement. Several New Jersey arbitration awards were overturned in court when arbitrators placed excessive weight on comparability, thereby imposing costly settlements on municipalities that were fiscally stressed.^[6] The aggregate research on the wage impact of arbitration indicate only modest gains in mean salary levels.^[1]

A second critique is that arbitration, on average, favors unions, as arbitrators are more concerned about alienating unions that represent multiple bargaining units across a given geographic area than single employers who are less likely to share information. However, most arbitrators possess a clear incentive to issue balanced awards in order to maintain their credibility. The available empirical evidence indicates relative balance between labor and management in terms of wins and losses in arbitration.^[1]

A third critique is that the availability of arbitration radically reduces the incentive of labor or management to settle voluntarily. There are two variants of this dysfunctional effect. The first is the “chilling effect” in which arbitration attenuates the motivation of the parties to settle earlier in the collective bargaining process given the absence of a strike or lockout threat.^[9] The second drawback is the “narcotic effect,” which occurs when one or both parties perceive that they have a greater chance of success in achieving their collective bargaining goals through arbitration than through traditional collective bargaining.^[10] Hence, the rate of arbitration use increases dramatically over time. Empirical evidence on the chilling and narcotic effects are mixed, however, with strong regional differences.^[1]

Other less common impasse resolution strategies include labor–management committees composed of neutral representatives from labor, management, and the community. The committee members are appointed by the governor based upon nominations by the respective stakeholders. Another strategy is a public referendum, or letting the public vote on issues at an impasse. This strategy manifests several disadvantages, including the difficulty in communicating complex bargaining issues, lack of voter interest and education on the issues, the expense and delays

associated with the voting process, and an increase in political posturing.^[1]

CONCLUSION

The primary goal of impasse resolution is to reduce the number of strikes and lockouts in order to preserve labor peace, safeguard service delivery, and protect the public interest. Voluntary settlement of collective bargaining disputes is the desired outcome, but given the many factors that mitigate against voluntary settlements, impasse resolution procedures are a necessary safeguard. The central objective is to assist the parties in clarifying their basic interests so a reasonable compromise can be crafted. Mediation and fact finding are nonbinding impasse resolution procedures, while arbitration and its variants impose finality to the collective bargaining process.

Incrementalism, Budgetary

Carol W. Lewis

Department of Political Science, University of Connecticut, Storrs, Connecticut, U.S.A.

INTRODUCTION

Incrementalism is an approach to decision making in general and to budgeting in particular. It is used in descriptive and explanatory variants and may refer to the decision-making process or outputs from the process. This perspective relies upon established roles, decision rules, and shared expectations; it broadly divides budgeting into the base and relatively small changes or marginal adjustments; decision making is characterized by a process of “successive limited comparison;” and politics is the dominant explanatory variable.

DEFINITION

Aaron Wildavsky initially described budgeting as incremental, meaning that it is “based on last year’s budget with special attention given to a narrow range of increases or decreases.” The focus is on “relatively small increments to an existing base” and a “small number of items over which the budgetary battle is fought.”^[1] The literature of public administration and public budgeting include numerous definitions.^[2–4] One definition sees incrementalism as:

... a theory of the budgetary process proposing that policy makers give only limited consideration to small parts of the budget and arrive at decisions by making marginal adjustments in last year’s budget... participants [in different roles] make decisions through a process of bargaining and negotiation.... The budget as a whole is not considered.... Instead, participants make marginal changes on an already existing base.^[5]

There are four central ingredients to budgetary incrementalism. The first is that change is marginal and occurs by small steps. The second ingredient is the base, which answers the question: Change from what? Wildavsky defined the base as the “general expectation among the participants that programs will be carried on at close to the ongoing level of expenditures” and operationalized the concept using appropriations.^[1] As a result, “[t]he largest determining factor of the size and content of this year’s budget is last year’s budget. Most of the budget is a product

of previous decisions.”^[1] (His illustrations include standard items, long-range commitments, mandatory programs, and sacred cows.) He stated the following:

The previous year’s budget, the largest part of which is composed of continuing programs and prior commitments, is usually taken as a base needing little justification.... Attention is normally focused on a small number of incremental changes, increases and decreases, calling for significant departures from the established historical base of the agency concerned.^[6]

The idea of *fair share* is the third ingredient and invokes open, pluralist decision making moderated by participants’ shared expectation of short-term proportionality and longevity. All players anticipate sharing in the action (increases or decreases) and returning again to compete for resources in future budget cycles. This concept is operationalized by budget share, the relative size of the budget going to a program or agency.^[1] As a result, incremental budgeting is often depicted as limiting the scope and intensity of competition. Illustratively, *A Citizen’s Guide to the Federal Budget*, a federal resource published annually for the general public, lays out major categories of spending according to the budget share of each.^[7]

The fourth and last ingredient is roles, of which there are two main types: program advocate or promoter and resource guardian or naysayer. Roles are especially important because, with incrementalism, which relies upon politics as an explanatory factor, decisions are seen as outcomes from negotiations and accommodations among a stable group of players, including the chief executive, bureaucrats, professional budgeters, legislators, and others. Long-term relationships and, therefore, strategy develop as players come back to the process in each budget iteration.

Participation, like roles, is believed to hold down competition in the process. “Whatever else they may be, budgets are manifestly political.... Participants in budgeting... drastically simplify their task by concentrating on the relatively small portion of the budget that is politically feasible to change.”^[6] As a political perspective on decision making, incrementalism:

assumes that political pluralism, limited rationality, and time and resources pressures on public administrators are significant constraints on decision making.

Consequently, administrators typically can take only small steps toward some general policy objective.... The test of the desirability of a decision tends to be measured in terms of political support or opposition, rather than cost-effectiveness or scientific analysis.^[4]

INTELLECTUAL FOUNDATIONS

Formative contributions to incremental decision making were made by Herbert A. Simon and Charles E. Lindblom. It is ironic that incrementalism, developed by economists and strongly influenced by psychology as well as economics, emphasizes the political aspects of decision making. One budgeting textbook asserts, "The most important characteristic of the muddling through or incrementalism approach as applied to budgeting is its emphasis on the proposition that budgetary decisions are necessarily political."^[8]

In his *Administrative Behavior* published in 1947, Simon emphasized observable behavioral factors and decision-making processes over the rationalist precepts, structures, and norms associated with the preceding orthodox perspective on administration.^[9] He argued that, because of cognitive limits, external developments, and other constraints, decision makers operate within *bounded rationality*. In 1958, James G. March and Simon introduced a new word to the vocabulary of administration: *satisficing*.^[10] This refers to the "process of finding a decision alternative that meets the decision maker's minimum standard of satisfaction.... Agencies must satisfice by accepting partial solutions rather than pursue illusory, perfect, or optimal solutions."^[2]

In his now classic article, "The Science of 'Muddling Through,'" first published in 1959, Lindblom built upon these ideas about cognitive limits and decision-making strategies.^[11] "The incrementalist paradigm he advanced is uniquely comprehensive, including elements of pluralism, satisficing, bounded rationality, organizational drift, limited cognition, and decentralized authority."^[2] Lindblom's central thesis is that there are two distinct varieties of decision making. One he calls the rational-comprehensive or root method, and the second, the successive limited comparisons or branch method.^[12] The latter "assumes that a historic chain of decisions exists which the administrator can use as a basis for future choices."^[2] Accordingly, "public administrators pragmatically select from among the immediate choices at hand the most suitable compromise that satisfies the groups and individuals concerned" and actual decision making is incremental, "for small steps are always taken to achieve objectives, not broad leaps and bounds."^[12] Lindblom revisited his view of "muddling through" in a 1979 article.^[13]

The foremost scholar of budgetary incrementalism, Aaron Wildavsky applied the concepts associated with

Simon and Lindblom specifically to budgetary decision making with the publication in 1964 of the first edition of his *Politics of the Budgetary Process*.^[1] Much of the literature in public administration and in budgeting for the next two decades was devoted to examining incremental decision making empirically and theoretically.

IMPACT

One reason for incrementalism's profound influence is that it criticized and ultimately outweighed the faith in rationalism and progress that had dominated public administration since the latter part of the nineteenth century. As the predominant model of decision making and particularly budgetary decision making, the incremental model of decision making has been applied to federal, state, and local governments in the United States and to other governments around the world.^[14-16] "Incrementalism has been the favored political approach to public budgeting in the United States."^[4] Indeed, it served as the conceptual core of budgetary decision making; its basic concepts and writings were routinely featured in texts, scholarly collections, and dictionaries.^[2] Lindblom's "The Science of 'Muddling Through'" is familiar to every student and scholar in public administration and Aaron Wildavsky's *Politics of the Budgetary Process*, once the single most widely used text in the field, went through many editions since its initial publication in 1964.

CRITIQUE

Incrementalism quickly came under fire for analytic biases, scientific shortcomings, and normative implications ascribed to it. A wide-ranging and influential critique written by Lance LeLoup concluded that its "self-fulfilling nature renders incrementalism nearly useless for social science theory."^[14] Another critique acknowledged that incrementalism is "intuitively and experientially appealing," but with a "lure" attributable to "the chaos in human behavior" rather than to its meeting epistemological standards.^[17] At least nine major criticisms have been leveled at incrementalism as a decision-making theory or heuristic model.

1. Incrementalism is associated with bias toward stability and conservatism.^[3,14] Wildavsky asserts, "Once enacted, a budget becomes a precedent; the fact that something has been done once vastly increases the chances that it will be done again. Since only substantial departures from the previous year's budget are normally given intensive scrutiny, an item that remains unchanged will probably be

carried along the following year as a matter of course.”^[1] The thrust, then, is this: the best predictor of an agency’s budget request is history. Of course, stability is anticipated only in the short term, because annual reiterations allow for rapid change, albeit in small steps, compounded over a few years. Lindblom’s 1979 response to this criticism was that “incrementalism in politics is not, in principle, slow moving. It is not necessarily, therefore, a tactic of conservatism. A fast moving sequence of small changes can more speedily accomplish a drastic alteration of the status quo than can an only infrequent major policy change.”^[13]

2. In much of the research, aggregation is at high levels that smooth change at the agency or governmental level and mask underlying changes in programs. Variance analysis is a standard tool in budget analysis and is often included in Comprehensive Annual Financial Reports. Variance analysis at as low a programmatic or organizational level as possible yields a more accurate count. Variance is calculated by disregarding positive and negative signs and simply adding together *all* changes from the prior base. An increase of \$150,000 in one program and a cut of \$150,000 in another in the same agency do not cancel each other out, but rather sum to a \$300,000 variance or change.
3. Predictive power in effect is sacrificed in favor of descriptive accuracy, because incrementalism fails to link decision-making dynamics to specific budgetary results. One slant on this issue is that incrementalism addresses only a small part of what budgeting entails. Surely, demand is a factor weighing on the budget in a politically responsive system, where projected changes in the use of a service or good such as public parks may translate into changes in spending. However, there are numerous other factors pressing on budgets that cannot be directly attributable to current decision makers. In fact, a great proportion of governmental budgets are settled before decision makers even get to work. Debt service on long-term debt incurred by previous decision makers is a legal obligation that current budgets must honor; the same is true of accrued liabilities such as pensions and other personnel benefits. Multi-year labor and service contracts and economic conditions such as inflation, unemployment, gross domestic product, and personal income may generate changes in prices and needs as, for example, reflected in the eligibility pools for entitlement programs. (The public is most familiar with the Consumer Price Index at

<http://stats.bls.gov/cpihome.htm>.) Demographic and other social changes (e.g., age structure, household formation) affect services from schools to public safety to elderly services and public works. Changes in programs and services that are required by law (or *mandated*) may mean changes in service levels, beneficiary eligibility, and benefits. (Some changes may be inter-governmental mandates that are addressed at <http://www.cbo.gov/cost.html>.) Courts also may mandate program changes with significant budgetary impact on, for example, prison conditions or services for the mentally ill. Many of these changes substantially reduce decision-making discretion over a given fiscal year’s budget, and budget outputs are pushed by factors other than incremental decision making. This critique suggests that, while incrementalism is an accurate depiction of a small-to-trivial part of the budget, it fails to address the major factors influencing budgetary outputs.

4. The value or size of marginal change is not specified, although Wildavsky used plus or minus 10% of the prior year’s appropriation. Lindblom argued, “Where the line is drawn is not important so long as we understand that size of step in policy making can be arranged on a continuum from small to large.”^[13] Specific variables defined in terms of clearly empirical referents are necessary if research is to be understood, replicated, and useful.
5. The major explanatory variable, the base, shares the problem of specificity. Scholarly work features differing concepts of the base, which may refer to prior year’s appropriation or current services. Current services refers to the resources necessary to continue programs at the prior year’s level and often allows for inflation, changes in law, and other factors.
6. Incrementalism focuses on expenditures to the exclusion of revenue decisions and outcomes, which limits its usefulness for understanding decision making in jurisdictions in which the budget must be balanced.
7. Incrementalism’s application to decision processes or budgetary outputs or both fosters confusion between them.
8. Incrementalism fails to meet the generally accepted criteria of a scientifically valid model as specified in items three, four, and five, above.

Today, incrementalism is in disrepute among some scholars. For example, Irene Rubin argued that the norms of moderation and fairness have diminished, because transparency and long-term relationships have diminished.^[18] Incrementalism is deemed inadequate in

several major respects as a *theory* that explains and predicts outputs from budget processes.

CURRENT USAGE AND SIGNIFICANCE

Incrementalism is still an important influence on the practice and understanding of budgetary decision making. General texts on public administration, texts on public budgeting, and collections of works considered classics in these fields continue to address incrementalism.^[3,4,12,19]

Explanatory incrementalism is no longer “the dominant theory of budgeting” it was a quarter of a century ago.^[14] On the other hand, its descriptive, process-oriented form remains a useful device by which to portray routine budgetary decision making for many—but by no means all—budget decisions in many jurisdictions. While noting that “budget processes are complex and vary widely among states” in its 1999 report on state legislative budget procedures, the *National Conference of State Legislatures* categorizes a majority^[14] of the states as relying predominantly upon a “traditional/incremental” budget approach (and more, if legislatures such as Delaware, Illinois, and Massachusetts that combine this with another approach are included).^[20] As Wildavsky noted, there is “nothing to be gained by ignoring overwhelming evidence or the observation of everyday life.”^[1]

The information provided and its presentation guide attention in particular directions and trigger particular analytic concerns.^[21] It is especially important that an incremental mode of decision making is built into many of the basic budget documents, because the “way in which budgetary questions are framed has a great deal to do with the outcomes of contests for public dollars.”^[4] (Many state and city budget documents are available online via jurisdictions’ home pages and see also the listings under Internet Resources.)

Four signs suggest that descriptive incrementalism as an analytic orientation is practiced at least to some extent. All four point to process, not outputs or outcomes. These signs include the following: 1) historical spending arrayed in columns alongside the current requests, as shown in the *State of Washington’s spreadsheets on expenditures history*, the *New York City Mayor’s proposed budget for fiscal 2002* with financial summaries and fire department data, and the summary schedule of spending in *A Citizen’s Guide to the Federal Budget for Fiscal 2002*; 2) the concept of current services as a point of departure for decision making, as illustrated by Section 1 of the *State of Washington’s operating budget instructions* for fiscal years 1999–2001; 3) an emphasis on change, as in many budget messages and narratives that

highlight new priorities and initiatives, as shown in the budget highlights for the *Illinois State Police* in the executive budget proposed for fiscal 2002; and 4) special detail on and scrutiny of new spending. *Connecticut’s legislative Office of Fiscal Analysis* noted in its description of budget formulation that agencies are “required to present a current services budget plan and a separate list of programmatic options if changes in expenditures or revenues are requested.” And, Sections 5 and 6 of the *State of Washington’s operating budget instructions* illustrate justification requirements.

Conventional formats display figures from prior years, the base, alongside figures for the current cycle. Some jurisdictions specify that the base is defined in terms of current services, meaning that budget requests allow for inflation, changes in law, and other factors. Change, expressed in percentages or dollars, is the decision-making focus in many budget documents; the executive’s budget message and summary narratives and schedules usually lay out proposed changes in detail. Instruction forms sent to the agencies at the beginning of budget preparation commonly require more elaborate justification of proposed changes than of ongoing operations; as a result, under ordinary circumstances, most of the base goes largely unexamined, and new competitors for the always scarce resources are relatively disadvantaged.

Indonesia

Rainer Rohdewohld

German Agency for Technical Cooperation (Deutsche Gesellschaft fuer Technische Zusammenarbeit—GTZ) (Support for Decentralization Measures Project/SfDM) (GTZ-SfDM), Jakarta, Indonesia

INTRODUCTION

More than 5 years after the downfall of the “Orde Baru” regime of ex-President Suharto, Indonesia continues to face a multitude of challenges. The political transformation into a competitive multiparty system reduced the political influence of the armed forces and realigned power between the state institutions. The emergence of vocal, but yet disorganized and therefore often still ineffective, civil society organizations is supported by a free but not yet fully professional mass media. The public sector continues to be characterized by inefficiencies, corruption, and lack of regard for the needs of the society at large. Last but not least, consolidation of economic recovery to provide employment opportunities for the millions of school graduates entering the labor market every year faces an increasingly competitive Southeast Asian environment.

In this context, the Indonesian public administration system needs thorough and far-reaching structural and procedural reforms. It is under increasing pressure to improve performance and accountability. However, public sector reform (with the exception of privatizing selected state-owned enterprises) has largely been neglected in the reform agendas of both President A. Wahid (November 1999–July 2001) and Megawati Soekarnoputri (since 23 July 2001). Institutional or individual “champions of reform” are lacking.

BACKGROUND AND TRADITION

The present Indonesian system of public administration reflects a variety of influences: Dutch colonial rule, indigenous (especially Javanese) customs and values, and the legacy of the “New Order” period of President Suharto (1965–1998).^[1] Centralization of power and the paternalistic attitude of the bureaucracy toward the public have been reinforced by the Suharto regime’s instrumentalization of the public administration to stimulate and direct economic and social development after 1967. Accelerating economic growth, improving social welfare, and maintaining political stability were major achievements of the administration during that period,^[2] during which the bureaucracy, together

with the military, became the most powerful state institution. Despite frequent initiatives for economic deregulation since the early 1980 which increased the role of the private sector in economic and social development, and despite the widespread absorption of public sector reform concepts from abroad, the notion of “development administration” continues to find much sympathy with civil servants and political leaders.

THE CIVIL SERVICE

Indonesia has a civil service system based on life-long appointments of civil servants. There are four service ranks (*golongan*) according to educational background, which are divided into four to five grades, giving the civil service a total of 17 service levels. Civil service positions are either staff positions with no specific professional or managerial responsibilities, managerial positions (*jabatan struktural*), or professional/technical positions (*jabatan fungsional*). The latter have their own specific recruitment requirements and career paths, based on technical/professional skills and expertise. Managerial positions are divided into four levels (*eselon*), echelon I level being the highest.

The total size of the Indonesian civil service was around 3.9 million in 2002, thus being slightly below the regional average of 2.6% of the population.^[3] In addition, there is a huge number of contractual staff (especially at the regional level) who do not have civil servant status. There are concerns about the sectoral and geographical distribution of staff^[4] and about the quality of available skills and competencies: only around 25% of the civil servants have tertiary education, and nearly half (around 1.8 million) are classified as administrative-auxiliary staff (*tenaga administratif*).^[5] A civil service survey in mid-2003 found more than 100,000 fictitious civil servants on the public sector payroll, indicating the weakness of existing internal management and control mechanisms (Table 1).

The Indonesian civil service has been observed to show the negative features associated with closed career systems: lack of managerial flexibility and accountability, limitation of the pool of leadership talent

Table 1 Distribution of civil servants, 1989–2002

	1989		1994		1999		2002	
		in %		in %		in %		in %
Central Government	3.151.661	86.9	3.471.595	87.5	3.519.959	87.9	930.602	23.7
Regions	475.954	13.1	494.183	12.5	485.902	12.1	3.002.164	76.3
Total	3.627.615	100	3.965.778	100	4.005.861	100	3.932.766	100

Source: Ref.^[9].

to insiders, dominance of seniority and patronage in promotion and appointments, and lack of incentives to perform well.^[3] Low pay has often been cited as a reason for low performance and for the widespread corruption in the administrative system; however, World Bank studies have concluded that wage bill increases will not by themselves achieve improved outcomes from the public sector,^[6] and that low pay cannot be regarded as the main driving force for corrupt civil service behavior.^[7]

In May 2002, the State Ministry for Administrative Reform presented an outline of reform initiatives, which included reviewing the role and functions of government agencies, regulating working mechanisms, increasing human resource capacities, improving performance appraisal systems, curbing corruption, and increasing the quality of public services.^[8] Considering the disappointing track record in public sector reform and the lack of strategic direction from the political leadership, observers have little optimism about the chances of such a reform program succeeding.

Several government agencies compete in the management of the civil service system: formally, the State Ministry for Administrative Reform [*Kementerian Perdayagunaan Administrasi Negara*—(MenPAN)] is the lead agency for formulating and coordinating public administration policies, including civil service policies, policies regarding the procedures and mechanisms of delivering public services, and policies regarding the institutional setup of government agencies. The National Civil Service Agency [*Badan Kepegawaian Nasional* (BKN)] is in charge of personnel administration and sets national norms and standards for recruitment, promotion, and staff rotation. The National Institute for Public Administration [*Lembaga Administrasi Negara* (LAN)] determines national policies for civil service training, implements key training programs, and conducts research on public administration. The Ministry of Finance determines the budget ceilings for the government's personnel expenditures and for the formation of the individual central government agencies.

The revision of the civil service law in 1999 included the stipulation to establish an independent Civil Service Commission; however, this has not been implemented yet because of shifting policy priorities and internal resistance in the government's bureaucracy.

STRUCTURE OF THE CENTRAL GOVERNMENT ADMINISTRATIVE SYSTEM

The central government bureaucracy consists of several types of organizations: coordinating ministries (*Kementerian Koordinasi*) which oversee a range of government institutions, departments (*Departemen*) with policy making and implementing functions, state ministries (*Kementerian Negara*) which develop and coordinate government policies in specific areas such as research and technology, and non-departmental (technical) agencies [*Lembaga Pemerintah Non-Departemen* (LPND)] which implement government policies in their respective fields of jurisdiction. Currently (October 2003), there are 3 coordinating ministries, 17 departments, 10 state ministries, and 25 technical agencies. The state and cabinet secretariat, which includes the secretariat of the vice president, is the administrative institution supporting the work of the president and the cabinet. The president is formally at the apex of the central government administration and determines the government's policies, while the ministers are regarded as “assistants” to the president.

The organizational structure of a department consists of the minister as the politically appointed head of the department. A secretariat general is in charge of policy coordination and of internal services (such as personnel management, finance, and public relations), while directorate generals are the main operational units. All are headed by an echelon I official. Most departments have their own training, as well as research and development units. Departments can have subordinated implementation units [*Unit Pelaksana Teknis* (UPT)] in charge of more technical or administrative matters. Before decentralization, departments used to have deconcentrated offices in the regions. This is now limited to those departments implementing exclusive central government functions.

While the total number of management positions in central government agencies has decreased by around 60% since 1999, the number of echelon I positions nearly doubled during the same period. Some departments have drastically reduced their personnel expenditures, and others report drastic increases.^[9] Contrary to expectations, there has been no comprehensive

reconfiguration of the central government administration as a result of the decentralization policy.

THE CHALLENGES OF DECENTRALIZATION

The decentralization policy included the administrative transfer of more than 2 million civil servants from central government agencies to the regions. Regions had no discretion to select or to reject staff in line with the regions' quantitative or qualitative needs. As a result, all regions are overstaffed, and many have created a vast landscape of local government agencies that does not reflect their actual needs. Nepotism and the need to buy in political support have contributed to this mushrooming of local government agencies. Recently, the central government issued a new and controversial regulation on the organizational setup of local governments (Government Regulation No. 8/2003) in an attempt to limit the overall size of the local government sector.^[10]

The decentralization law grants the regions full authority to manage their regional civil service in accordance with national regulations, norms, and standards. The revised civil service law maintains key features of the Indonesian civil service as a unified system, in which entry requirements, preconditions for promotion, performance appraisal system, and all issues related to remuneration are determined by the national level and apply to all civil servants irrespective of whether they work at central or regional level. The continuing existence of a unified national civil service is regarded as a major factor in the context of maintaining national unity.

In general, the structure of administration at the local level consists of a regional secretariat [*sekretariat daerah* (Setda)], which coordinates the formulation of regional policies and provides administrative support to the head of region, of technical agencies (*dinas*) which implement services in the main sectors (such as infrastructure, health, and education), of other technical institutions (*lembaga teknis daerah*) including a regional development coordination agency [*Badan Perencanaan Pembangunan Daerah* (BAPPEDA)], and subordinated implementation units [*unit pelaksana teknis daerah* (UPTD)]. Local government agencies not only implement decentralized tasks (*tugas desentralisasi*), but can also be tasked to implement central government tasks in their respective geographical areas (*tugas dekonsentrasi*).

Part of the decentralization policy was a radical overhaul of the system of local government financing. The percentage of public funds managed by the regions nearly doubled, and in 2002, regions controlled public funds representing 5.6% of the GDP.^[11] The new system of fiscal transfer consists of untied block grants

[*Dana Alokasi Umum* (DAU)], regional shares on certain taxes and revenues from natural resources, and specified grants [*Dana Alokasi Khusus* (DAK)] in priority policy areas of the government. Regions continue to be financially dependent on central government transfer, with own-source revenue in most cases remaining below 10% of the total regional revenue.^[12,13]

PUBLIC ADMINISTRATION REFORM

The lack of pace in reforming the public administration is deeply linked with the issue of public sector corruption. Indonesia has consistently been rated as one of the most corrupt countries in Asia and the world. Public sector corruption involves petty corruption where citizens have to pay a few thousand rupiah to obtain certificates and official documents, the taking of commissions and kickbacks by officials for the procurement of goods and services, the large-scale embezzlement of public funds by senior officials, and corruption within the civil service where appointments and promotions are being bought.^[14] Any attempt to streamline the public administration and to introduce innovative concepts of public sector management is facing the major hurdle of how to eradicate corruption first. Some steps have been taken after 1998: in 1999, parliament passed the Clean Government Law No. 28/1999 which requires state and public officials to declare their assets before assuming their posts. They also have to agree to have their assets officially audited during and after their terms of office. Law No. 31/1999 on the Eradication of Criminal Acts of Corruption provides the legal basis for establishing charges and procedures for prosecution. Political support for a consistent enforcement of both laws has been lacking, and only recently has the required Anti-Corruption Commission been set up. Because corrupt behavior is so deeply embedded in public sector behavior, only a concerted effort with full political support can hope to achieve significant improvements.

There are some areas where reforms have been initiated to improve public sector performance and to make public administration more accountable. Efforts are being made to reform the public financial management system,^[15] with the recently enacted Law on State Finance (Law No. 17/2003) being a key building block in this reform strategy.^[16] Two other laws (on state treasury and on state audit) are currently being debated in the parliament. Efforts are being made to reform the public procurement system.^[17] The emphasis of Law No. 17/2003 on performance budgeting is being complemented by a Ministerial Decree of the Ministry of Home Affairs (KepMendagri No. 29/2002) which requires all regions to use performance

budgeting as of 2004. While these efforts have their own merits, they lack integration in a wider public sector reform strategy, which is certainly not on the present agenda of the political leadership.

CONCLUSION

In its 2002 Governance Assessment of Indonesia, the Asian Development Bank (ADB) came to the conclusion that “the national system of administration and the civil service system are not sufficiently conducive to good governance and improved performances. Both systems need fundamental reform taking internationally recognized good practices into account.”^[14] Increasing the demand for accountability of public institutions and public officials is one option to press for public sector reform. It is no coincidence that if positive changes of the public administration occur, they occur at the local level,^[18] where decentralization and democratization put increasing pressure on local governments to justify their performance toward their electorate. Improving public finance management by fully enforcing the new law on state finance and by concentrating public finance functions in the Ministry of Finance will also have a positive impact on public sector performance. Incremental reform efforts will be more effective if integrated in wider, medium-term reform strategy which receives the political report needed.

Information Sources and State Policy Making

Jill Clark

Department of Political Science, University of Texas at Arlington, Arlington, Texas, U.S.A.

INTRODUCTION

In the last three decades, many American state legislatures have adopted reforms that expand institutional information sources (more professional staff and fewer committees) and encourage legislative independence from information provided by interest groups or the executive department. Studies suggest that individual legislators sometimes prefer information from constituents, other legislators, and legislative staffs. However, interest groups are also key information sources. Committees rely heavily on information from the executive department and interest groups, but information from legislative staffs is important as well.

Outside information (e.g., from other states or from national policy organizations) is transmitted through contacts made by the legislative and executive staffs and legislators, or through interstate interest group networks. This outside information may be most important for scientific issues, economic development policies, and, perhaps, for legislative leaders and minority representatives. Future research might focus on whether different information sources are more or less important at different stages of the policy-making process, for various policy areas or types, in different legislative contexts, or for particular legislators such as leaders.

LEGISLATIVE REFORMS: INFORMATION SOURCES

In the 1960s, “good government” reformers (e.g., The Citizens Conference on State Legislatures) advocated that American state legislatures enhance their policy-making capacity by developing institutional information sources: legislative research bureaus and larger and more professional committee staffs.^[1] Reformers also favored the reduction of committees so that legislators could develop substantive policy expertise with a limited number of committee assignments.^[2] Reformers argued that as a result of professional staffing and “expert” legislators, committees would become islands of policy information and recommend workable, efficient legislation. More importantly, legislators would no longer need to rely so heavily on information from interest groups.

Reformers also encouraged the adoption of an executive budget for the governor, so that professional staff

could provide information for policy making. However, some reform groups maintained that legislative reliance on information from the executive department would compromise the independence of the legislature. Thus, preserving the independence of the legislature became another rationale for developing professional information sources inside the legislature.^[3]

STATE LEGISLATURES: THE RELATIVE IMPORTANCE OF INFORMATION SOURCES

Research on information sources in state legislatures initially focused on the adoption of institutional reforms (fewer committees and larger legislative staffs).^[4] Researchers also surveyed legislators about the relative importance of information sources both for individual voting choices and for committee decision making. Constituents, the media, policy organizations, think tanks, and universities were included as possible information sources along with legislative and executive staffs, interest groups, and expert legislators.^[5–7] One expectation was that constituent information would be the most important source because a legislator’s primary concern was likely to be reelection or career advancement.^[8] In other words, legislator motivations for information were assumed to be quite different from those of reformers. Another expectation was that certain characteristics of information would be salient to legislators. As a result, legislators would prefer information from legislative colleagues or staffs (insiders) because insider information was likely to be reliable, timely, and easily accessible.^[9]

Overall, research findings suggested that there were multiple sources of information for legislative policy making, and that constituents and insiders were sometimes the most important information sources for individual members.^[10,11] A recent survey of legislators in 12 states indicated that grass-roots organizations, legislative staffs, statewide lobby groups, and national ethnic organizations were the four most important information sources.^[12] Furthermore, there were differences in information source preferences among legislators: Minority representatives used more sources of information than other legislators and were more likely to rely on information from conferences, the Internet, ethnic associations, and local branches of

national organizations. Other legislators were likely to rely more heavily on information from the media and statewide lobby groups.

Legislative committees tended to rely most heavily on information from executive agencies and interest groups.^[13] In other words, legislative staffs had not made committees independent of interest groups or executive agencies as primary information sources. However, policy information from legislative staffs was also important particularly on technical policy issues.^[14] Specialist committee members made the most contacts with outside sources.^[15,16] However, in general, policy organizations, the media, and universities did not rank highly as legislative information sources for committee decision making.

Most of the research on information sources has relied on surveys of legislators' reported preferences for information sources, and only a few studies analyzed the legislators' information use.^[17] Furthermore, some findings are based on a single state, and most are based on a small group of states. As a result, study results are tentative, and it is difficult to generalize across states or over time. There has been some interest in determining whether states with professional staffs and fewer committees choose different policies from those with fewer institutional resources. In general, the conclusion is that they do not; instead, policy differences are tied to differences in state environments. The most affluent states are those most likely to adopt legislative reforms and to choose generous expenditures for programs such as education.^[18] The same is true for policy innovation: Professional legislatures had little independent effect on whether states are leaders in adopting new policies.^[19]

However, in 1971, The Citizens Conference on State Legislatures found that reformed legislative institutions were more efficient,^[20] and the Advisory Commission on Intergovernmental Relations, in 1982, suggested that reformed state legislatures were more professional, open, responsive, and representative than unreformed legislatures.^[21] However, some observers argued that legislative staffs had developed too much power for influencing elected officials. Later, legislative reforms came under scrutiny by citizens who believed that state legislatures have become remote, careerist, and elitist. These arguments have resonated in some states: Legislative term limits have been enacted in 21 states, and both annual legislative meetings and staff size are targets for change in several other states.

INFORMATION SOURCES: INTERSTATE POLICY DIFFUSION

Although information sources research underscored the importance of information sources within a state,

cross-state diffusion research suggested that states quite frequently borrow policies from other states, especially neighbors. States often have similar policies, suggesting a flow of policy information among them and the use of that information in legislative policy making.^[22,23] Moreover, the tendency of states to adopt similar policies has increased in recent decades,^[24] perhaps in part because information technology facilitates both easier and timely access to information about other states' policies. Interstate tax base competition has stimulated similar business incentives policies,^[25] tax types or rates,^[26] state-run lotteries,^[27] and educational reforms.^[28] The notion of "welfare magnets" may encourage some states with the most generous welfare benefits to reduce those benefits in comparison with other states.^[29]

One possibility for reconciling the findings of the information sources and policy diffusion literatures is a two-step communication process where staffs, expert legislators, or interest groups acquire information about other states' policies and then provide that information to legislators. Surveys of executive department staffs suggest that bureaucrats are actively involved in professional networks and are aware of policy developments in other states.^[30-32] Specialist legislators typically report more contacts with information sources outside the state than other members. Certain individual characteristics such as ethnicity, educational level, or years of experience^[33] may differentiate specialists from other members. Some interest groups rely on interstate advocacy coalitions to diffuse policy innovations to state legislatures.^[34,35]

Although interstate staff and interest group networks have received some attention, there has been no research on the role of governors in acquiring information from outside the state.^[36] The National Governor's Association is typically described as an organization that presents governors' views to the national government as a means of enhancing the reputation of governors with presidential aspirations. The assumption seems to be that governors rely primarily on political parties or executive department staffs to provide specific policy solutions. Legislators, like governors, have access to several national policy organizations (e.g., the National Conference of State Legislators, the Council of State Governments, the National Legislative Exchange Council, and the State Government Affairs Council), and there is some evidence that legislators acquire information independently of staffs.

In fact, legislators now have more incentives for outside searches for policy information because legislators are more "careerist." Policy accomplishments or campaign issues can be part of a strategy to stay in office.^[37] In other words, policy information from outsiders may have political uses for legislators: job security and/or career advancement. Moreover, pressures from constituents, citizen groups, the media, public

opinion polls, and, in some cases, direct democracy^[38] could also motivate legislators to initiate their own policy proposals. Independent policy information could make the legislature an initiator of policy, rather than a more passive institution that responds to proposals from either the executive department or from the citizens.

National policy organizations (such as the Council of State Governments) offer a number of advantages as information sources for legislators. Professional staffs prepare research, and organizational meetings offer legislators contacts with peers from other states. Information is available on political feasibility, and there is policy evaluation on programs that are in place in other states.^[39] Internet communications make it possible to gain information quickly, and legislators can interact with peers. Thus, the same characteristics of information that appealed to legislators inside the institution are now available from national organizations: peer information and information that is reliable, timely, and easily accessible.

Policy solutions borrowed from national organizations can be adapted to the political context of a particular state or to a legislator's political agenda.^[40] One possibility is that constituents or interest groups inside the state define problems, but solutions are borrowed from national policy organizations. Alternatively, policy information may be more relevant to the initial formulation of legislation and constituent or insider information, to agenda setting, or to the adoption of legislation. Policy information may also be useful in persuading other legislators or the public, or in justifying existing political beliefs.^[41]

INFORMATION SOURCES: LEGISLATIVE LEADERS

Given their positions, legislative leaders may be most attuned to legislative independence, election agendas, and career advancement. As a result, leaders may engage in more outside information searches than members. Recent research from a national survey has focused on legislative leaders' (speakers, senate presidents, and minority and majority leaders) contacts with information, and their use of information from national policy organizations.^[42,43] Results suggested that leaders from "springboard legislatures" and/or from states without legislative term limits relied more on national organization information than leaders from dead-end or term-limited legislatures. Perhaps the most active leaders are motivated by the value of outside information in the context of legislatures that provide long-term career opportunities.

Additionally, both majority and minority leaders from states with one-party control of the legislative and executive institutions are more active in joining

national organizations and in attending meetings than those from states with divided-party control. It could be that for these leaders, national organizations provide possible policy solutions independent of instate actors, and leaders can claim credit for policy accomplishments.

Compared with leaders in states with larger staffs, leaders in states with small legislative staffs reported that national organization information was more important. Leaders from small states were more active in joining professional associations and in attending meetings than those from large states, possibly because small states have fewer instate information sources. Perhaps these leaders seek more independence from the executive department, or they see political advantages associated with outside information.

CONCLUSION

Future research might investigate the information sources of policy makers other than legislators. There has been no attention to information sources for governors, and there has been little interest in executive department staffs. Future research on legislative policy making might focus more on identifying information sources utilized at different stages of the policy-making process (agenda setting, formulation, and adoption) and in further distinguishing the information sources of committees from those of individual legislators. Information uses should include not only policy making, but also political advantage (career advancement). Perhaps, ironically, the reformers' goal of legislative independence may be embraced by legislators who see career opportunities in acquiring policy information. Furthermore, interstate policy diffusion may be at least partially a product of politicians' political ambitions.

Additionally, different information sources may be more or less important for certain policy areas. For example, outside information may be more salient for policies that involve interstate competition for economic development, or for scientific or technical issues. Information use may also be influenced by differences in legislative context. Perhaps outside information is more important in legislatures with limited staff capabilities and/or in legislatures with the most career opportunities. Legislative leaders may be more attuned to the political advantages of outside information than to its members. Women and minority legislators may be more likely to seek information from national organizations that emphasize their concerns.

Information Systems

Mary Maureen Brown

Piper S. Charles

*Department of Political Science, University of North Carolina at Charlotte,
Charlotte, North Carolina, U.S.A.*

INTRODUCTION

An information system (IS) can be defined as a set of interrelated components, such as hardware, software, policies, communications, users, and data, that collect, manipulates, stores, and disseminates data and information that support the business activities of the users. As the public continues to place pressure on government to provide services cheaper, better, and faster, public managers have sought ways to streamline their operations to achieve those objectives and improve services. Information systems are the support mechanism to enhance and improve an organization's ability to carry out its primary mission and achieve its organizational goals. Through the use of information systems, government operations can be conducted more quickly, accurately, and efficiently. In addition, information systems permit government agencies to make a wide range of information available to the public, as well as conduct business electronically. By the end of 2000, nearly 40 million Americans were doing business with the government electronically.^[1]

Strategic information management is the process by which top agency officials and line managers plan, direct, and evaluate the use of information and information systems to help accomplish their programmatic objectives. Organizations need accurate, reliable, and timely information for strategic planning, identifying objectives, improving productivity, and facilitating service delivery. Technology is becoming the vehicle from which accurate, reliable, and timely information is produced to achieve organizational goals.

Government agencies can leverage the strengths of information systems to achieve efficiencies and operational gains, such as eliminating duplication and process bottlenecks, streamlining processes, increasing productivity, broadening the range and scope of service delivery, improving analysis and decision-making capabilities, enabling coordination of processes across distances and functions, reducing complexity, and adding value for the customer.

TYPES OF INFORMATION SYSTEMS

There are several types of information systems: office information systems, transaction processing systems, management information systems, decision support systems, expert systems, executive information systems, and geographic information systems.

Office Information System

An office information system improves workflow and communications among employees in an organization. The software supports activities such as word processing, spreadsheets, databases, presentations, e-mail, scheduling, and web browsing. It may even include voicemail, fax, scanner, and videoconferencing from the desktop computer.

Transaction Processing System

A transaction processing system collects and processes data on a routine basis, generally performing the same transactions on large amounts of data. The strength of these systems is their ability to process large amounts of data quickly and repetitively. Examples of transaction processing systems are a payroll system, utility billing system, or a computer-aided dispatch system for fire and police.

Management Information System

A management information system (MIS) is a system designed to support the information needs of managers to make decisions and solve problems within the organization. A management information system has the ability to analyze data and provide timely, accurate, and meaningful information in the form of reports. For example, a utility billing MIS system might produce reports to indicate high water usage in the summer months that managers may need to react

to, or identify water leakage based on unusual water usage. Water usage information can be useful for planning water line expansions or additions. Likewise, the police department can use MIS systems to examine call for service data to assist in resource deployment and to identify problem areas with repeat calls for service.

Decision Support System

A decision support system (DSS) is used more in business than in public organizations. A decision support system is used to provide a greater level of detailed information to support a particular decision. A DSS is able to handle large amounts of data from internal and external sources to support the problem-solving process. For example, some coastal jurisdictions are looking to decision support systems to determine the best time and method for evacuating coastal residents in the event of a hurricane. The DSS can calculate a number of factors, such as number of residents affected; characteristics of the hurricane, such as its rate of approach, wind speed, size, and potential for damage; available roads; and other factors to assist emergency management authorities in determining the best plan for evacuation.

Executive Information System

An executive information system (EIS) is similar to a decision support system designed to assist the decision-making process of the executive. An executive information system will often present the data in the form of charts and graphs to indicate pattern and trends and other statistics to assist the executive in developing strategic plans for the future activities and direction of the organization.

Expert System

An expert system is an information system that collects and stores the knowledge of human experts, draws conclusions from complex relationships, and provides the reasoning used to arrive at a suggested decision. The expert system can assist less-experienced users through the decision-making process. The expert system has two components: the knowledge base and inference rules. The knowledge base is the collection of human knowledge, and the inference rules are a set of business rules applied to the knowledge base to generate a suggested solution or decision. Expert systems are seen in the medical field to assist doctors in diagnosing diseases based on a patient's particular set of symptoms. A unique feature of the expert system

is its ability to capture human expertise that can be shared with other less-experienced users.

Geographic Information System

A geographic information system (GIS) can take data in tabular form that is associated with a location and present that data in a graphical format on a predrawn map. An example of the use of a GIS is in local area planning, where a map can indicate various zoning classifications over the county map. This geographic representation of data can aid managers and planners in developing zoning policy and future area development plans. Police departments often utilize GIS to identify areas of concentrated crimes, called "hot spots," or to identify patterns of crimes occurring in particular locations. Geographic identification aids police in developing tactics to address specific crime problem locations.

COMPUTER LITERACY VERSUS INFORMATION LITERACY

In order for the public manager to be able to develop appropriate information systems, the public manager must be computer literate as well as information literate. Computer literacy is the knowledge and understanding of hardware components, communications and networks, programming languages, and software applications, such as databases. Information systems literacy includes not only knowledge of computer technology but also the broader scope of what data and information are required by the organization's personnel and the customers in order to achieve organizational mission and goals. This includes how to find information, how to analyze the information, as well as how to use the information effectively. Understanding how to apply the various types of information systems within the organization to obtain maximum use of available data is the essence of information literacy. Knowledge management is the ability to derive knowledge from data and information to be applied to provide solutions to future business problems.

SYSTEMS DEVELOPMENT

Systems development is the process of creating, developing, or modifying information systems to support agencies' missions and goals. The systems development life cycle (SDLC) is a set of activities developed to assist and guide the development of information systems. The SDLC provides several steps, such as

planning, analysis, design, implementation, maintenance, and review.

The Clinger–Cohen Act of 1996 set requirements for performance-based and results-oriented decision making for all major developments of information technology at the federal level. Investments in information systems and technology can have a significant impact on an organization's performance but only when they are well managed and focused on supporting the organization's mission. A key goal of the Clinger–Cohen Act is for agencies to establish mechanisms to ensure that information system projects contribute in a measureable way to improved mission performance and are implemented in a reasonable time frame and at a reasonable cost.

These mechanisms include the first stage of selection: developing a portfolio of information system projects; identifying the costs, benefits, and risks associated with the projects; determining priorities; and selecting those projects that should be funded for the near future, based on how well the projects support the goals of the organization. The second stage involves controlling of the project and ensuring that the projects deliver the expected benefits on time and within budget. The third stage is the evaluation of projects and the use of the lessons learned in the next selection stage.^[2]

CHALLENGES AND OBSTACLES

The implementation of information systems in the public organization brings several challenges for the public executive. The public manager must ensure that strategic goals, information, and technology are integrated into common organizational procedures, ensure that effective management strategies are applied to all information technology adoption efforts, and ensure that everyone on the project is involved in risk management.

However, public managers are faced with obstacles often unique to public organizations. Although IT implementation is considered a high-risk endeavor in public and private sectors, the obstacles to successful implementation in the public sector tend to be greater for several reasons:

1. Public managers often are not motivated to implement large technology projects. Rarely does a public manager receive any incentive, monetary or otherwise, for a successful technology implementation that results in significant productivity gains. However, the public manager is fully exposed to public criticism if the system fails in any number of categories. As a

result, public managers tend to be conservative with technology implementation, relying on only proven technology.

2. Agency executives often do not have a clear line of authority for information system implementation. Often, their decisions must comply with existing laws, budget appropriations, legislative mandates, and a host of other political influences. Further, many agency executives have tenure that is short-lived, compared to the relatively long life cycle of system implementation.
3. Government agencies and programs are influenced by a number of stakeholders who often have competing interests and goals. The act of balancing and mediating these competing interests often stifles the creativity and implementation of information systems.
4. Most government agencies budgets are developed on an annual basis. The uncertainty of the future availability of funds to continue an information system project implementation as well as support and maintain the project after implementation hinders the ability of public managers to plan and implement information systems successfully. In addition, budgets and policy or program mandates are often legislated separately and may not correlate with each other.
5. Public agencies have more intangible and diverse goals and objectives with efficiency that is harder to measure. They provide services on the basis of public interest rather than services exchanged in the economic market.
6. The procurement mechanisms for government are cumbersome and time-consuming. While designed to maintain integrity and fairness in government acquisitions, the competitive procurement processes are often a source of problems and delays. These delays create additional complications for the procurement of technologies that are constantly changing.^[3,4]

SECURITY, PRIVACY, AND ETHICS

Security, privacy, and ethics are additional issues that must be considered during the development and management of public agency information systems. Security pertains to the protection of the components of information systems from loss, damage, or unauthorized access. Computer viruses and hackers are two examples of security breaches that can damage information systems or allow unauthorized access to and exposure of confidential information about citizens. System failure, electrical power loss or power surges, as well as the physical security of equipment from

tampering, theft, or damage from natural disasters can place information systems at risk.

Public agencies collect a wealth of information on individuals. Privacy refers to the right of these individuals to control or restrict the collection, storage, or dissemination of personal data without their knowledge or consent. This issue surfaced recently when several state departments of motor vehicles were said to be selling drivers' license information to third parties in order to earn revenue to ease strained budgets. Many citizens have a strong interest in who gains access to personal information contained in records retained by public agencies.

Ethical issues are of concern in not only how the information collected and retained by public agencies is used but also in the accuracy of the information. One example involves a man whose identity was "stolen" by another man who lives in another state. The other man has an extensive arrest record, and the man whose identity was stolen nearly lost a job opportunity because of his "arrest record." The problem is in placing responsibility on a particular agency for data accuracy and developing procedures for ensuring data accuracy. Unfortunately, in this case, the "victim" was unable to correct this inaccuracy, and the national crime computer still shows an arrest history for him. Other ethical issues involve the appropriateness of supervisors to monitor employee use of

the Internet, or track their whereabouts during work hours via the use of electronic key cards.

CONCLUSION

Information systems can provide accurate, reliable, and timely information to public agency managers to support the achievement of the agency missions and goals. In addition, information systems can be used to facilitate the delivery of services to the public (see the article *Electronic Government*).

Innovation and Public Policy

Stuart S. Nagel

Political Science Department, University of Illinois, Urbana, Illinois, U.S.A.

INTRODUCTION

The purpose of this article is to discuss some aspects of the relations between public policy and creativity. There are basically two kinds of relations in this context. One set deals with how public policy can help stimulate creativity. The other set of relations deals with how creativity can be helpful in improving public policy.

On public policy as a stimulant to creativity, this article briefly discusses policies that relate to politics, economics, socialization, and psychology. On creativity in improving public policy, this article briefly describes pushing, facilitating, and pulling factors. It also discusses sources of policy goals and policy alternatives. It further discusses concepts that are useful in arriving at win-win public policies.

Win-win policies are alternatives that can enable conservatives, liberals, and other major viewpoints to all come out ahead of their best initial expectations simultaneously. Win-win is also called superoptimizing or doing better than the previous best of all major groups.

There are basically five steps to win-win policy analysis:

- What are the major goals of conservatives, liberals, or other major groups who are disputing what policy should be adopted for a given policy problem?
- What are the major alternatives of those groups for dealing with the policy problem?
- What are the relations between each major alternative and each major goal? In their simplest form, these relations can be expressed in terms of a minus sign (relatively adverse relation) and a plus sign (relatively conducive relation) and a zero (neither adverse nor conducive relation).
- What new alternative is there that might be capable of:
 - Achieving the conservative goals even better than the conservative alternative.
 - Simultaneously capable of achieving the liberal goals even more than the liberal alternative. Whatever new alternative meets these two criteria is a win-win alternative or a superoptimum solution (SOS).

- Is the proposed win-win alternative capable of getting over various hurdles that frequently exist? These hurdles may be political, administrative, technological, legal, psychological, and economic in random order. Win-win solutions should also consider how to upgrade workers and firms that may be displaced by downsizing due to increased productivity, free trade, defense conversion, immigration, merit treatment, labor utilization, creativity, and related factors.

PART ONE: PUBLIC POLICY IN STIMULATING CREATIVITY

The following political, economic, sociological, and psychological institutions or ways of doing things in a society are conducive to innovative and effective public policy making. This includes public policies that can enable conservatives, liberals, and other major viewpoints to come out ahead of their best initial expectations simultaneously, i.e., superoptimum or win-win solutions.

Political Methods

Competitive political parties

This is a key facilitator, because the out-party is constantly trying to develop policies (including possibly SOS policies) in order to become the in-party. The in-party is also busy developing new policies in order to remain the in-party. New policies are developed largely as a result of changing domestic and international conditions, not just for the sake of newness. Without the stimulus of an out-party, the in-party would have substantially less incentive to be innovative. More important, without the possibility of becoming the in-party, the out-party would lose its incentive to be innovative. More innovation generally comes from the out-party than the in-party (all other factors held constant), including the possibility of SOS innovations.

Better policy analysis methods and institutions

SOS solutions are likely to be facilitated by policy analysis methods that deal with multiple goals,

multiple alternatives, missing information, spreadsheet-based decision-aiding software, and a concern for successful adoption and implementation. Better policy analysis institutions refer to training, research, funding, publishing, and networking associations. These institutions can be part of the activities of universities, government agencies, and independent institutes in the private sector. The extent to which these policy institutions deal with superoptimizing analysis will make them even more relevant to facilitating SOS solutions.

Economic Policies

Competitive business firms

Competition among political parties may be essential for facilitating SOS public policy. Competition among business firms may be essential for facilitating a prosperous economy and a prosperous world through international business competition. Numerous examples can be given of nations that failed to advance and collapsed due largely to a one-party system, such as the former Soviet Union. Likewise, numerous examples can be given of business firms that failed to advance and virtually collapsed due largely to lack of substantial competition, such as the American steel industry. The American automobile industry has not collapsed, but it failed to develop small cars, cars that resist style changes, safer cars, less expensive cars, and more durable cars in comparison to the international competition that was not taken seriously until almost too late.

Well-targeted subsidies and tax breaks

In the context of superoptimum solutions, this tends to mean subsidies and tax breaks that increase national productivity and international competitiveness. Such subsidies and tax breaks are the opposite of handouts that provide a disincentive to increased productivity on the part of welfare recipients or big business. Good targeting in this regard especially refers to upgrading skills and stimulating technological innovation and diffusion. A dollar invested in those kinds of subsidies is likely to pay off many times over without necessarily having to wait very long for the results.

Increased national productivity

All these facilitators are important. Economists might rightfully consider increased national productivity to be especially important. It leads to an increased gross national product or national income, which means an increased tax base to which the tax rate is applied.

If increased productivity increases the tax base, then tax rates can be lowered and still produce more tax money for well-targeted subsidies that produce further increases in national productivity. These increases, however, are not an end in themselves. The increased national income can facilitate finding and implementing SOS that relate to employment, inflation, agriculture, labor, business, poverty, discrimination, education, families, the environment, housing, transportation, energy, health, technological innovation, government structures, government processes, world peace, international trade, and every other public policy-field. In other words, with more money and resources available, SOS solutions are facilitated, but SOS solutions often draw upon creativity that is associated with doing much better on relevant goals with constant or decreasing resources.

Sociology: Childhood Socialization

Risk-takers get generated from about age 0 to 5 in little children, depending on whether they are allowed to take chances or are treated in such a way that they never come in contact with anything that might hurt them. There is certainly a need for encouraging more experimentation on the part of children, within reason. More rebelliousness, more of the kind of trying out to see what will happen if you push your food off the highchair onto the floor without being punished for doing so, to see if the bowl will break or not. That does not necessarily mean that you jump off the third-story porch to see if your head will break.

Liberals have a lot of trouble talking about socialization, because it sounds like brainwashing people. It can be done in a brainwashing way, or it can be done in a way that encourages children to think things out for themselves to some extent. An example might be telling children not to discriminate on the basis of race or gender, as contrasted to setting up a situation where they more creatively reason that discrimination is undesirable. Such a situation might involve the teacher calling for volunteers to erase the blackboard and virtually everyone volunteers. The teacher says we cannot have so many people erasing the blackboard, and we might therefore just pick the African-American girls. She then asks for reactions and alternative suggestions. She thereby stimulates creativity and possibly an implicit understanding of such concepts as merit treatment, sharing benefits, sharing costs, having a minimum benefit threshold, having a maximum cost threshold, and other such ideas without using those words.

In the SOS context, this refers to creating a frame of mind that causes adults to do what is socially desired, because the alternative is virtually unthinkable. This

can be contrasted with a less effective emphasis on deterrence, whereby socially desired behavior is achieved through threats and bribes. Examples include childhood socialization to reduce adult behavior that is violent, alcoholic, drug addictive, and hostile toward constitutional rights.

Psychology of SOS Solutions

Innovative risk taking

This is an important SOS facilitator, because many SOS solutions involve technological fixes. In order to develop new technologies, many people usually had to risk substantial amounts of money, time, effort, and other resources. There may have been a strong possibility that it would have all been wasted. An SOS society needs more people who are willing to take such chances. Classic examples include Marie and Pierre Curie who sacrificed about 30 years of work plus their health to develop radium and thus radioactivity, which is part of the basis for nuclear energy. Thomas Edison frequently not only risked his resources but also his reputation by announcing inventions before he had developed them in order to give himself an ego risk as a stimulus to quickly inventing what he falsely said he had already done.

Sensitivity to opportunity costs

This means trying through socialization or an appropriate incentive structure to get decision makers to be more sensitive to the mistake of failing to try out a new idea that might work wonders, as contrasted to being so sensitive to sins of commission rather than omission. Both wrongs are undesirable. One can, however, say that a police officer who wrongly beats a suspect is doing less harm to society than a president who wrongly fails to adopt a new health care program that could save numerous lives or a new education program that could greatly improve productivity and the quality of life. A person who is sensitive to opportunity costs tends to say “nothing ventured, nothing gained,” whereas an insensitive person tends to say “nothing ventured, nothing lost.” We need more of the former in order to facilitate the generating, adopting, and implementing of SOS.

SOS combination of pessimism and optimism

This does not mean a balance or a compromise between being pessimistic and being optimistic. It means being 100% pessimistic or close to it regarding how bad things are and how much worse they are going to get unless we actively do something about

them, including developing SOS solutions. It simultaneously means being 100% optimistic or close to it regarding how good things can get in the future if we vigorously work at them, including developing SOS. This is in contrast to those who say the present is wonderful and needs little improvement. It is also in contrast to those who say the present may be wonderful or not so wonderful, but some invisible hands or automatic forces of Adam Smith, Karl Marx, or God will automatically improve the future.

Constantly seeking higher goals

This list of societal facilitators is in random order. Some of the items overlap or interact, but it is better to overlap than leave gaps in this context. It is appropriate perhaps to have the last facilitator relate to constantly seeking higher goals. Traditional goal seeking leads to compromises. Worse, it can lead to one side trying to win 100% and the other side losing 100%, but the war, strike, litigation, or other negative dispute resolution leads to both sides losing close to 100%. Obviously, seeking higher goals is more likely to result in higher goal achievement than seeking lower goals, including SOS goal achievement. The counterargument sometimes made is that higher goals lead to frustration because of the gap between goals and achievement. There may be more frustration in fully achieving low goals that provide a low quality of life when others are doing better. High societal goal seeking (including SOS) is facilitated by all of the above factors, but it is a factor in itself, because high goal seeking tends to become a self-fulfilling prophecy.^a

PART TWO: CREATIVITY FOR IMPROVING PUBLIC POLICY

Pushing, Facilitating, and Pulling Toward Innovative Public Policy

A useful way of organizing ideas for stimulating creativity is in terms of pushing factors, facilitators, and pulling factors. That three-part organization comes from Frederick Jackson Turner's analysis of the causes of people moving west in the 1800s. The pushing factors included undesirable aspects of the East, such as overcrowding, lack of jobs, and debts. Facilitating factors included wagon trails, railroads, river systems, and other means of transportation. Pulling factors

^aOn public policy in stimulating creativity, see Ref. ^[1]. Also see Refs. ^[2,3].

included attractions in the West, such as free land and business opportunities.

In this context, the pushing factors include other people and commitments. The facilitators include relevant literature, working style, and multicriteria decision making. The pulling factors include the rewards that go to successful imagination. The rewards here emphasize intellectual rewards, partly because the article is based on experience in academic and government activities, where monetary rewards are not as great as they are in business. The reader can adjust the ideas, however, to fit other contexts besides the academic and governmental contexts.

Pushing factors

Other People as Pushing Factors. Talk with someone else about generating alternatives. Trying to explain alternative ways of achieving something with an audience listening stimulates more ideas than talking or thinking to one's self. Put one's head together with someone else who is trying to come up with ideas. The interaction of two or more people trying to generate ideas tends to work better than one person alone. Have contact with stimulating colleagues via correspondence, conventions, informal campus relations, or other on-the-job relations. Work with graduate students and undergraduates to develop dissertations, seminar papers, and term papers.

Work with different people to provide a variety of interaction. Arrange to be asked questions by people with a variety of orientations, including sincere inquiry, skepticism, cynicism, and even a touch of malice. Try to operate in an interdisciplinary environment for a great variety of perspectives. Apply one's creative ideas to see what happens in practice.

Commitments as Pushing Factors. Accept a commitment to write an article, a book chapter, or a conference paper on how to deal with a policy problem. That is likely to generate new alternatives. Teach in those fields in which one wants to generate policy alternatives. Take on obligations to coauthor articles, chapters, or papers.

Take on obligations to do consulting work that involves generating alternatives. Prepare grant proposals. Arrange for competitive situations as a stimulus to developing new ideas.

Facilitators

Literature. Consult the literature in the field. There may be lots of alternatives already suggested. There are some software checklists that might be worth trying, such as "Trigger" published by Thoughtware

and the "Idea Generator" published by Experience in Software, Inc., 2039 Shattuck Avenue, Suite 401, Berkeley, CA 94701. Keep up with the newest ideas in various policy fields. Read provocative literature. Know the general literature in the fields in which one is interested.

Read some of the literature on creativity, including the list of references attached to this article. Have theoretical frameworks that can serve as checklists and prods for developing alternatives. Be familiar with the methods of knowing, including how to inductively generalize, how to deduce conclusions, how to determine what authorities hold, and how to do sensitivity analysis. Think about ways of generating ideas like this article or adding to this article.

Working Style. Talk out loud about the possible alternatives. Dictating is better than thinking in generating ideas. Delegate work to others in order to have more time to think. Have a pencil and paper handy at all times or dictating equipment to write or dictate ideas that come to one's mind before they are lost. Schedule time periods for creative development and idea implementation. The more time periods the better. Occasionally travel in order to provide a variety of environments.

Multicriteria Decision Making. Try listing some alternative, even if one only has in mind one or two alternatives to begin with. Merely trying to generate a list tends to result in more items being listed than one originally had in mind, or thought one had in mind. After generating some alternatives, then list some criteria for evaluating them. That will lead to more alternatives. After generating alternatives and criteria, then generate some relations between the alternatives and criteria. That will lead to more alternatives. After generating alternatives, criteria, relations and initial conclusions, then do various forms of sensitivity analysis designed to determine what it would take to bring a second-place or other-place alternative up to first place. That may generate still more alternatives.

If there is a situation in which there are two conflicting sides, each one favoring a different alternative, look to see what kind of alternative could maybe satisfy the goals of both sides. Also look to the possibility of a compromise alternative that will partially satisfy each side if it is not possible to find an alternative that will fully satisfy both sides. Then, observing how the alternatives score on the criteria, ask how each alternative can be improved. Try to convert the alternatives, criteria, relations, tentative conclusions, and sensitivity analysis into a publishable table with notes. That may generate new alternatives.

Pulling factors: rewards

Be motivated to want to generate alternatives. Arrange to be in situations where one is rewarded for generating alternatives, such as recognition, grants, publishing opportunities, graduate students, consulting opportunities, etc. Non-intellectual rewards can also be arranged for. These might include money, power, love, food, sleep, pure recreation, etc. Operate in a permissive environment that encourages experimentation and new ideas. The earlier one can get into such an environment the better, preferably starting at birth.

Some people use heredity as an excuse for not being creative. In both areas, there is a substantial range in which each person can operate. If one is more determined, then one can operate closer to the top (rather than the bottom) of one's inherited range. Creativity is probably less a matter of heredity than intelligence is. It is more susceptible to the kind of pushing, facilitating, and pulling factors mentioned above. Thus, one can more easily arrange to be a more creative person than one can arrange to be a brighter person by seeking more favorable occurrences of those factors. Doing so can be rewarding, as well as produce the kinds of rewards mentioned above. The broader rewards accrue not only to the individual, but also to the many potential beneficiaries of individual creativity. It is an ability well worth stimulating by society and by one's self.^b

Sources of Goals and Alternatives

Public-policy evaluation can be defined as the determination of which various governmental policies or decisions are best for achieving a given set of goals in light of the relations between the alternative policies and the goals and various constraints and conditions.

This definition emphasizes four key elements in public-policy evaluation:

1. A set of goals to be achieved within various normative constraints.
2. A set of alternative policies or combinations of policies that could be relevant to achieving the goals.
3. A set of relations between the policies and the goals.
4. The drawing of a conclusion from those goals, policies, and relations as to which policy or combination is best.

^bOn pushing, facilitating and pulling toward innovative public policy, see Ref. [4].

Where do these goals, policies, and relations come from? The answer includes four main possibilities:

1. Authority: one or more persons, books, articles, or other reliable sources of information regarding the relevant goals, policies, or relations.
2. Statistical or observational analysis: the analyzing of specific instances in order to generalize what the goals, policies, or relations might be.
3. Deduction: the drawing of a conclusion from premises that have been established from authority, observation, and intuition.
4. Sensitivity analysis: the guessing of the goals, policies, or relations and the determination of what effect, if any, the guessed values have on the final decision regarding which policy is best.

The four basic sources can be subclassified in various ways. For example, authority can be meaningfully discussed in terms of expert authority and general public opinion. Authority could also be contemporary or historical. Observation can be impressionistic or systematic, including statistical. Deductive approaches can be based on intuitively accepted premises or on empirically validated premises. Sensitivity analysis is threshold analysis in which we want to know the break-even point, above which we should take one course of action, and below which we should take another.

Authority

Consulting authorities, rather than establishing the goals, feasible policies, or relations in a policy evaluation with original data or reasoning, can be a big time saver. Traditional social science tends to downplay introspective information-gathering methods, in contrast to non-obtrusive methods. In policy evaluation, however, perhaps more consultation with insiders is needed in order to obtain more meaningful information about relationships than can be obtained from the limited and questionable data records that are available.

Who constitutes an authority on goals, policies, or relations? The answer depends on the subject matter. The Supreme Court is an authority, for example, on what goals are legitimate in satisfying the right-to-counsel clause of the Sixth Amendment to the Constitution. The Court has said that saving money is not an appropriate goal, but that saving innocent persons from being convicted is. If, however, the issue is not where right to counsel should be provided but rather how it should be provided, then saving money is an appropriate goal. For this issue, the goals of a county board would be relevant, because it generally appropriates money to pay court-appointed lawyers to

represent the poor. Such goals might include satisfying local lawyers while minimizing expenditures. The board might, therefore, decide on a salaried public defender system, rather than on a less expensive but less politically feasible assigned counsel system or a less legally feasible volunteer system. For other policy problems, the key authorities might be legislative opinion, public opinion, the head of an administrative agency, or the like.

Statistical observation

Statistical analysis is the most systematic form of inducing generalizations from many instances or observations. It is generally used for establishing relations, rather than for establishing goals or feasible policies. Statistical analysis can, however, be useful in establishing goals or weights for the goals, whenever the goals, rather than being ultimate, are instrumental for achieving higher objectives.

Accounting is a variation on statistical analysis. Like statistical analysis, it involves aggregating data, but accounting data is generally more precise than statistical analysis that is based on averages or the fitting of curves to scattered data points. A public opinion survey is not a variation on statistical analysis in the context of the typology of sources used in this article. Rather, it is a form of consulting authority in which the authority is the general public or a special segment of it. A statistical analysis (as a distinct source of information on goals, policies, or relations) involves a cross-tabulation, an analysis of the variation between averages, or a regression-equation analysis. These forms of statistical analysis involve determining a relation that is relevant to weighting goals, deciding which policies are feasible to choose among, or relating a policy to a goal.

Deduction

Deduction involves arriving at a conclusion from premises that have been established by way of authority, empirical validation, prior deduction, or intuition. The more acceptable the premises are, the more acceptable the conclusions should be, assuming the conclusions have been validly deduced from the premises. Deduction is especially helpful where there is no authority and no empirical data for determining the information desired.

It is important to note that deductively analyzing premises may lead to an alternative policy that might be missed if one only relies on authority or statistical analysis. Authority is often not very creative in foreseeing problems, and statistical analysis is incapable of dealing with policies that have never been adopted.

Sensitivity analysis

In policy evaluation, sensitivity analysis is a useful source of information about goals, policies, and relations when authority, statistics, and deduction do not provide clear answers regarding them. Sensitivity or threshold analysis enables one to determine how much room for error there is in weighting the goals, listing the policies, or measuring the relations. Often, the controversy over precision in these matters is wasted, because within the range in which the controversy occurs, the overall conclusion as to which policy or combination is best is still the same. Sensitivity analysis also enables the policy evaluator to convert difficult questions about goals, policies, and relations into relatively easy questions, such as, "Is a given weight, policy, or relation above or below some threshold?" rather than, "What is the exact weight, policy score, or relation?"

In using sensitivity analysis to determine a set of feasible policies, we have to distinguish between a method that will provide a set of policies from which we can choose, rather than a method designed to arrive at an optimum policy. All four sources of information can be used to arrive at feasible policies or an optimum policy.

Intuition

Intuition is closely related to sensitivity analysis as a source of goals, policies, and relations. Sensitivity analysis frequently involves determining how different guessed values affect the optimizing conclusions. Intuition is also a form of guessing or basing estimates on strong feelings. Goals are sometimes accepted intuitively rather than being justified in terms of authority, statistics, or higher premises. This is especially so if the goals are general or near-ultimate goals, rather than instrumental. Policies may often be suggested as a result of a flash of insight, which is the case with hypotheses in traditional social science research. Although it is not generally respectable in social or policy science to arrive at relations through intuition, one can repeatedly guess at a relation until the reasonable possibilities have been exhausted and then see how these guesses affect the optimizing conclusions. One may find that it is unnecessary to be any more scientific than that, because all the reasonable guessed values may yield the same conclusion as to which policy is best.

Ultimately, all goals and relations depend on intuition. Goals can be justified by appeal to authority, statistics, or deduction. However, how does one justify the authority, the dependent or goal variable in a statistical analysis, and the basic premises in a deductive analysis? One can likewise ask for a justification of

these justifications. In policy evaluation, one usually has an overall goal that is accepted intuitively, such as promoting the greatest happiness for the greatest number or satisfying the decision makers. Likewise, one can ask, why does policy *X* cause goal *Y*? The answer might be that there is a *Z* variable between *X* and *Y* which is caused or increased by *X*, and which in turn, causes or increases *Y*. One can then ask, why does *X* cause *Z*, and why does *Z* cause *Y*? At each stage of the causal regress, one tends to move further away from substantive policy and social science toward natural science and metaphysics. Ultimately, the question becomes, how do we know there is an *X* or a *Y*? That is, how do we know there is such a thing as a congressional statute or an American population that has social-indicator characteristics? In other words, on a philosophical level, we have to accept some empirical reality, such as the existence of the world. Fortunately for most policy evaluation, the goals in dispute are seldom ultimate goals, but rather instrumental goals that can be justified in terms of authority, statistics, or deduction. Similarly, the relations are seldom, if ever, metaphysical; rather, they can also be explained in a satisfactory, non-philosophical way in terms of authority, statistics, and deduction.

We can conclude from this analysis of the sources of goals, policies, and relations in policy evaluation that there are a variety of sources that can be systematically classified. We can also conclude that perhaps policy evaluation should be making more use of the variety of sources available. Unfortunately, certain disciplines tend to overlook some sources at the expense of others. Law and political science seem to rely heavily on authority as a source, especially legal authority. Psychology and sociology may rely too heavily on statistical analysis, which tends to overemphasize variables that are easily measurable and policies that need to be adopted before they can be evaluated. Economics and engineering often rely too heavily on deduction, especially mathematical modeling, which sometimes involves unrealistic or incomplete premises. By working with a combination of authority, statistics, and deduction, one provides a form of triangulation that increases the likelihood of arriving at more meaningful goals—weights, policies, and relations.

There is no need to argue over which source between authority, statistics, and deduction is the most desirable. Authority is clearly a big time saver if an accessible and respected authority is involved. Deduction enables one to draw conclusions about goals, policies, and relations without having to gather original data, but instead by synthesizing already known information. Statistical analysis constitutes a more ultimate, but more difficult, form of proof. In any concrete policy evaluation situation, the best source depends on the subject matter and what is to be done with it.

If the policy evaluation involves constitutional policy, an appeal to Supreme Court authority may be most relevant. If it involves the effects of a strike in the coal industry on another segment of the economy, a deductive input–output model may be the preferable type of analysis. If it concerns the trade-off problem of inflation and unemployment, a time-series statistical analysis may be especially appropriate in relating inflation and unemployment to suicide rates, to the percentage of the two-party vote that goes to the incumbent party, or other social indicators.

We can also conclude that sensitivity of threshold analysis is a useful tool in policy evaluation, because even with authority, statistics, and deduction, it may still not be possible to arrive at precision in weighting goals, measuring policies, or determining relations. Sensitivity analysis enables one to determine whether increased precision is needed. It is only needed if the range of unclearness on a goal–weight, a policy, or a relation happens to encompass a threshold value. Thus, if the range of unclearness on a goal–weight or a relation is between 20 and 30, but the threshold value of the goal–weight or the relation is 10, then one can forget about clarifying the unclearness if one is mainly concerned with determining which policy is best. If, however, the threshold value is 26, then one should seek additional information from authority, statistics, and deduction to determine whether the actual value is above or below 26.

The purpose of this article has been to discuss the sources of goals, policies, and relations in policy evaluation. The article represents a synthesis of reasonable common sense, at least as a matter of hindsight. That is what good policy evaluation should be, namely, codified common sense. For thousands of years, many human beings have been making effective and efficient decisions. What decision science and policy science should now try to do is to capture the essence of what these good decision makers have done implicitly. Less naturally competent decision makers can then improve their decision-making or policy-evaluating skills.^c

A Typology Toward Win–Win Public Policy

There are about 14 different ways of arriving at win–win superoptimum solutions, whereby conservatives, liberals, and major viewpoints can all come out ahead of their best initial expectations simultaneously. The list could be used as a checklist to prod one's mind into thinking of solutions to specific problems.

^cOn sources of goals and alternatives toward innovative public policy, see Ref. [5].

More resources to satisfy all sides

Expanding Resources. An example might include well-placed subsidies and tax breaks that would increase national productivity and thus increase the gross national product and income. Doing so would enable the tax revenue to the government to increase, even if the tax rate decreases. This would provide for a lowering of taxes, instead of trying to choose between the liberal and conservative ways of raising them. It would also provide for increasing domestic and defense expenditures, instead of having to choose between the two.

Third-Party Benefactor. Some situations involve a third-party benefactor that is usually a government agency. An example is government food stamps, which allow the poor to obtain food at low prices, while farmers receive high prices when they submit the food stamps they have for reimbursement. Another example is rent supplements, which allow the poor to pay low rents, but landlords receive even higher rents than they would otherwise expect.

More efficiency in achieving goals

Setting Higher Goals. An example of setting higher goals than what was previously considered the best while still preserving realism might include the Hong Kong labor shortage with unemployment at only 1%. Hong Kong is faced with the seeming dilemma of having to choose between foregoing profits (by not being able to fill orders due to lack of labor) and opening the floodgates to mainland Chinese and Vietnamese (in order to obtain more labor). An SOS might involve adding to the labor force by way of the elderly, the disabled, and mothers of preschool children. It also would provide more and better jobs for those who are seasonally employed, part-time employed, full-time employed but looking for a second job, and full-time employed but not working up to their productive capacity.

Decreasing Causes of Conflict. An example of removing or decreasing the source of the conflict between liberals and conservatives, rather than trying to synthesize their separate proposals, would be concentrating on having a highly effective and acceptable birth control program to satisfy proponents and opponents of abortion, because abortions would then seldom be needed. Another example would be concentrating on a highly effective murder-reduction program to satisfy proponents and opponents of capital punishment. Such a murder-reduction program might emphasize gun control, drug medicalization, and reduction of violence socialization.

Redefining the Problem. Quite often, a highly emotional controversy between liberals and conservatives may be capable of being resolved beyond the best expectations of each side through the approach of redefining the problem. They may be arguing over how to deal with a problem that is relatively unimportant in terms of achieving their goals, as contrasted to a more important problem on which they might be likely to get mutually satisfying agreement. This involves seeing beyond a relatively superficial argument to the higher-level goals that are endorsed by liberals and conservatives, although possibly not to the same relative degree.

Increasing Benefits and Decreasing Costs. There are situations where one side can receive big benefits but the other side incurs only small costs. An example is in litigation, where the defendant gives products that it makes. The products may have high market value to the plaintiff, but low variable or incremental cost to the defendant, because the defendant has already manufactured the products or can quickly do so.

Early Socialization. The socialization matter could be discussed across every field of public policy. If one is going to have a superoptimum society, then it is important what kinds of attitudes children have with regard to discrimination, poverty, world peace, crime, education, consumer-merchant relations, labor-management relations, free speech, and fair procedure. One could even say that the key purpose, or a key purpose of public policy, is to provide for a socialization environment in which children have socially desired attitudes on every field of public policy. If that is done properly, then a good deal of the problems of what policies to adopt will take care of themselves, because the need for public policy will be lessened. If children, for instance, are imbued with more of the idea of judging each other in terms of their individual characteristics rather than in terms of ethnic characteristics, then we have less need for public policies dealing with racism, because there is likely to be a lot less racism.

Technological Fix. The second level of insight is to communicate a recognition that such SOS are realistically possible and not just conceptually possible. A good example relates to the ozone problem and the use of fluorocarbons in hair sprays and other aerosol containers. As of about 1985, such devices represented a serious threat to depleting the ozone layer, thereby causing a substantial increase in skin cancer throughout the world. The solution was not to rely on an unregulated marketplace, which normally provides almost no incentives to manufacturers to reduce their pollution. The solution was not regulation or prohibition, which tends to be evaded, is expensive to enforce, and

is enforced with little enthusiasm given disruptions that might occur to the economy. The most exciting aspect of the solution (although the problem is not completely solved) was the development of new forms of spray propellant that are less expensive for manufacturers to use and simultaneously not harmful to the ozone layer.

This kind of solution tends to be self-adopting, because manufacturing firms, farmers, and others who might otherwise be polluting the environment now have an important economic incentive to adopt the new low-polluting methods, because they reduce the expenses of the business firm. This approach requires substantial research and substantial government subsidies for research and development as contrasted to paying the polluters not to pollute, which is even more expensive and often not so effective, because they may take the money and pollute anyhow. The business firms generally do not have capital for that kind of research and development, or the foresight or forbearance which public policy and governmental decision making may be more capable of exercising. This includes international governmental decision makers, as well as those in developing nations.

Contracting Out. As for how the SOS operates, it involves government ownership, but all the factories and farms are rented to private entrepreneurs to develop productive and profitable manufacturing and farming. Each lease is renewable every year, or longer if necessary to get productive tenants. A renewal can be refused if the factory or farm is not being productively developed, or if the entrepreneur is not showing adequate sensitivity to workers, the environment, and consumers.

As for some of the advantages of such an SOS system, it is easier not to renew a lease than it is to issue injunctions, fines, jail sentences, or other negative sanctions. It is also much less expensive than subsidies. The money received for rent can be an important source of tax revenue for the government to provide productive subsidies elsewhere in the economy. Those subsidies can be used especially for encouraging technological innovation–diffusion, the upgrading of skills, and stimulating competition for market share, which can be so much more beneficial to society than socialistic or capitalistic monopolies. The government can more easily demand sensitivity to workers, the environment, and consumers from its renters of factories and farms than it can from itself. There is a conflict of interest in regulating oneself.

International Economic Communities. An exciting new development with regard to international interaction to deal with shared policy problems is the international economic community (EC). It involves

a group of countries agreeing to remove tariff barriers to the buying and selling of goods among the countries as a minimum agreement to constitute an EC. The agreement may also provide for removal of immigration barriers to the free flow of labor, and removal of whatever barriers might exist to the free flow of communication and ideas. The European Economic Community is a good example, but other examples are developing in North America, Africa, Asia, and East Europe.

The alternative of having an economic community does well on the conservative goal of preserving national identity, because no sovereignty is lost in an IEC, as contrasted to the sovereignty that is lost in a world government or a regional government. The IEC may also add to the national stature of the component parts by giving them the increased strength that comes from being part of an important group. Thus, France may have more national stature as a leader in the European Economic Community than it has alone.

Likewise, the alternative of having an economic community does well on the liberal goal of promoting quality of life in terms of jobs and consumer goods. Jobs are facilitated by the increased exporting that the IEC countries are able to do. Jobs may also be facilitated by free movement to countries in the EC that have a need for additional labor. Consumer goods are facilitated by the increased importing that the EC countries are able to do without expensive tariffs.

More combinations of alternatives

Big Benefits on One Side, Small Costs on the Other. An example of this kind of SOS is the case of growers versus farmworkers in Illinois. The essence of the solution is that the growers agree to deposit \$100,000 to begin an employee credit union. Depositing \$100,000 costs nothing to the growers, because it is insured by the federal government and can be withdrawn after an agreed-upon time period, possibly even with interest. The \$100,000, however, serves as the basis for the beginning of an economic development fund that enables the workers through real estate leveraging to obtain a mortgage for building over \$500,000 worth of housing as a big improvement over their current housing. The existence of the credit union also enables them to avoid having to get advances from the growers, which generates a lot of friction as a result of alleged favoritism in giving and collecting the advances. There are other elements involved, too, such as new grievance procedures and reports regarding compliance with other rules governing the working conditions of migratory labor. The essence of the solution, though, is that both sides come out ahead of their original best expectations.

Combining Alternatives. An example of combining alternatives that are not mutually exclusive is combining government-salaried legal-aid attorneys with volunteer attorneys. Doing so could give the best of public-sector and private-sector approaches to legal services for the poor. Another example is combining tax-supported higher education plus democratic admission standards with contributions from alumni and tuition plus merit standards. Doing so results in universities that are better than pure government ownership or pure private enterprise.

Developing Multifaceted Packages. One can develop a package of alternatives that would satisfy liberal and conservative goals. An example is pretrial release, where liberals want more arrested defendants released prior to trial, and conservatives want a higher rate of appearances in court without having committed a crime while released. The package that increases the achievement of both goals includes better screening, reporting in, notification, and prosecution of no-shows, as well as reduction of delay between arrest and trial.

Sequential SOS. We can put the land reform example in with sequential SOS. The current verbalization does not say anything about encouraging the landless peasants to subsequently upgrade their skills to be able to take on non-agricultural work or to upgrade the skills of their children. We could change the SOS definition to say simultaneously or sequentially. One drawback is that there is subjectivity and favoritism as to which alternative goes first. Simultaneity has an air of equality and equity; doing it sequentially may be essential in terms of developing feasibility. It is not so feasible to do various alternatives or goals simultaneously.^d

CONCLUSIONS

Public policies that tend to stimulate creativity are those that relate to the following:

1. Competitive political parties.
2. Better policy analysis methods and institutions.
3. Competitive business firms.
4. Well-targeted subsidies and tax breaks.
5. Increased national productivity.
6. Childhood socialization.
7. Innovative risk-taking.
8. Sensitivity to opportunity costs.
9. Combination of pessimism and optimism.
10. Seeking higher goals.

Some of these stimulants are part of the culture, not just official or unofficial public policy.

Factors that stimulate innovative improvements in public policy include:

1. Pushing factors, including other people and commitments.
2. Facilitators, including literature, working style, and multicriteria decision making.
3. Pulling factors or rewards.
4. Consulting authorities as a source of policy goals and alternatives.
5. Statistical observation.
6. Deduction.
7. Sensitivity analysis or experimenting.
8. Intuition.
9. More resources to satisfy all sides in win-win policy.
10. More efficiency for achieving goals in win-win policy.
11. More combinations of alternatives in win-win policy.

It is hoped that this article will help build some bridges between people interested in creativity innovation and people interested in improving public policy.^e

Integrated Healthcare Systems: New Trends, Emerging Models, and Future Shocks

Yvonne J. Kochanowski

SteelEdge Business Consulting, Placerville, California, U.S.A.

INTRODUCTION

Integrating the continuum of healthcare providers both vertically across different levels of care and horizontally within a level has been an ongoing trend during the last two decades. The degrees of success in these ventures, however, have varied greatly. Some emerging models are incorporating more than traditional health organizations and are embracing new methods of governance, structure, and financing to reinvent the integrated holistic healthcare system of the future. This e-paper provides an overview of these new trends, emerging models, and future shocks.

HISTORICAL AND THEORETICAL BACKGROUND

To understand why healthcare organizations are evolving into integrated systems, it is important to study the unique development of healthcare in the United States. The history of this development can be identified in three specific categories:

- Individualism and autonomy transitioning to formal medical study: When the country was being settled, experienced lay healers were called upon to use herbs and folk medicines to cure ills and ease pain. As towns developed, fledgling physicians would apprentice with a more experienced doctor and would then move into a solo practice. Knowledge was shared by way of professional journals. The advent of medical schools after the War of 1812, credentialing and standards of practice with a medical license in the mid-1800s, and consultations between physicians in the mid- to late 1800s contributed to the reorganization of medicine.
- Facilities transitioning from dying wards to places of healing: Early facilities could do little to heal those who were unfortunate enough to enter their doors. Until capital was invested by the wealthy or by the physicians, hospitals did not have the resources to perform healing. The move from social welfare to medical science began when the profession of nursing was formalized and when antiseptic surgery became available well after the

Civil War. By 1900, hospitals had changed from voluntary structures to religious and ethnic-sponsored organizations and eventually evolved into a for-profit business run by physicians and corporations.

- Payors transitioning from social programs to risk insurance: Originally intended to guarantee wage replacement, to cover medical fees, and to pay the indirect costs of illness to society, insurance became a right to health benefits and shifted the focus to expanding the access to medical care in the early 1930s. By the 1950s, health insurance became a standard employment benefit, extended to the family as well as to the wage earner. Sophisticated systems of cost containment and utilization management provided the final shift in the past two decades.

According to Starr,^[1] five trends shifted the individualized pieces of the health system toward the integrated structures existing today:

- Changes in type of ownership and control from non-profit and government organizations to for-profit companies.
- Horizontal integration of similar providers into multi-institution systems.
- Diversification and corporate restructuring to corporations that strongly influence a geographic market.
- Vertical integration across the continuum of care at all levels of services.
- Industry concentration covering multiple regional and national geographies.

Four recent significant trends can be added to this list:

- Shifts from facility-based to outpatient, ambulatory, and home-care services, reducing the hospital power base.
- Changes in staffing patterns of care providers, reducing the impact of specialist physicians and increasing the emphasis on alternative staffing models.
- Increased pressures to reduce insurance premium costs, placing greater burdens on insurance

companies to manage limited financial resources without being accused of withholding quality patient care.

- Recognition that social services play an integral part of a successful system, providing the infrastructure of supports that meets the functional needs of those receiving care.

It is within this new framework that the need for collaboration and alliances between physicians, providers, payors, and social services organizations to serve the individual has arisen. This framework requires integrating all levels of patient care and stakeholders interested in the efficiency and the effectiveness of American healthcare.

INTEGRATED SYSTEMS DEFINED

Integrated healthcare delivery models are patterned on horizontal and vertical combinations of different levels of the continuum of care, types of providers, categories of payors, and needs of patients. This organizational realignment is traditionally performed to dominate the market—provide services to a greater portion of the patient population in a given geographic area. Theoretically, this realignment reduces the costs of services, improves service delivery for patients, and increases satisfaction of the various clients of the system.

A fully integrated delivery system is most typically defined as a system that ties the financing for services to the provision of all services, with all the parties sharing risk. Care is provided at the most appropriate level of care—clinically and from a cost-effective perspective. Accountability for community health status—wellness as well as treatment of illness—is also a cornerstone. Conrad and Dowling^[2] expanded this definition:

A vertically integrated health care system is an arrangement whereby a health care organization (or closely related group of organizations) offers, either directly or through others, a broad range of patient care and support services operated in a functionally unified manner . . . Full functional integration requires both administrative and clinical integration.

While this definition identifies the clinical continuum and support services that are necessary to the design of an integrated system, little is mentioned about the cost-effective provision of care. In responding to economic realities, the financial component must be built into the integration paradigm.

Coddington et al.^[3] define an integrated system as:

... a system that combines physicians, hospitals, and other medical services, along with a health plan

(or the ability of the system to enter into risk contracts), in order to provide the complete spectrum of medical care for its customers. In a fully integrated system, the three key elements—physicians, hospital(s), and health plan(s)—are kept in balance by common management and financial incentives so they can match medical resources with the needs of payers and patients.

The key characteristics of this definition include providers and payors, shared risk for the success of the venture, and cost effectiveness and information management systems which can maintain the efficacy of the system overall.

Shortell et al.^[4] add the following key characteristics to the definition:

We define an organized delivery system as a network of organizations that provides or arranges to provide a coordinated continuum of service to a defined population and is willing to be held clinically and fiscally accountable for the outcomes and the health status of the population served.

These researchers further point out that common ownership is not mandatory, and that a variety of strategic alliances and contractual arrangements is appropriate. Expanding the organization further, this structure takes the perspective from the individual to the organization and from the organization to the industry overall. What emerging trend and models can we expect based on this theoretical background?

EMERGING TRENDS AND MODELS

In a 1994 study, 71% of hospital and health network leaders said that their organizations are trending toward integrated delivery systems, with 81% saying that they would not exist as stand-alone institutions within 5 years.^[5] Four indicators—strategic direction, economic processes, organizational culture, and unique clinical capabilities—are normally used to gauge an organization's readiness for integration. With this framework in mind, more recent trends have emerged in the integrated healthcare marketplace. A sample of three—legal structure issues, incentive alignment, and organizational evolution—is discussed here.

Legal Structure

With the formation of a new or reorganized legal relationship, single ownership gives way to shared ownership management contracts, external party contracts, affiliation agreements, informal or formal memorandums of understanding, and formal acquisitions

and mergers. However, many individual providers, poised on the brink of integration with an established or fledgling system, face difficult issues in determining and then gaining approval for their legal structure. These approvals are not only internal to the organizations (governance, decision-making authority, responsibility for services) but also external (antitrust, market power, tax status).

According to Teevans,^[6] "... Antitrust laws seek to protect health care consumers from persons or entities that seek to, among other things, increase prices of, lower the quality of, or limit access to health care services." In both urban and rural settings, health care organizations are coping with the realities of the external controls by demonstrating that the creation or expansion of an integrated network not only improves access, but also allows the organizations to continue to operate, thereby providing vital services to a community. For example, if individual physicians were each to recreate information systems, contract negotiations, and risk coverage, they would have little time left for patient care. Furthermore, many may be forced to leave a market simply based on the economics of investing in all of these support systems.

Incentives Alignment

Clinical, financial, and patient satisfaction incentives are most commonly used to measure the improvement in health status of the community. Clinical integration occurs through the development of critical paths, care tracks, and collaborative case management plans, resulting in an interactive patient care process. Financial incentive alignments come about through capitation, contracting, and more closely managed cost and reimbursement. Improved patient satisfaction typically results from better communications, data sharing, and consumer inclusion in decisions about their care and services.

It is difficult, however, to develop these alignments quickly. Some, such as the integrated care tracks across different levels of care, can take months of education and negotiation between providers who had previously worked independently. In the financial incentives arena, Linenkugel^[7] asks, "How do providers keep going financially when the incentives are misaligned—when a lack of rewards for keeping people healthy is coupled with diminishing reimbursement from payers (government and commercial insurances) to care for persons who don't keep themselves out of healthcare trouble?" Finally, how can organizations consistently engage consumers in developing and implementing processes and systems that improve patient satisfaction?

Many organizations are addressing this through systems that:

- Include non-medical determinants of health, considered within a framework of health behaviors, living and working conditions, personal resources of patients/consumers, and environmental factors.
- Place greater emphasis on population health status, with indicators such as mortality and morbidity, balanced scorecards of changes in population health status, and self-reports of patient changes.
- Examine health status throughout the life cycle, considering both ends of the spectrum and all points in between, from babies to the senior population.
- Assess the coordination at all levels, both between levels of care and within care levels.^[8]

Organizational Evolution

While it is generally recognized that the theories behind the organization development, evolution, and utilization of system tools such as information systems have generally lagged in the health care practice field behind other industries, health systems have, in more recent years, begun to catch up. Barber et al.^[9] have applied a standard organizational evolution model to the healthcare field with the following findings:

The evolving IHS (integrated health system) will need to address the following infrastructure issues: a systemwide mission statement; a corporate culture that welcomes and integrates previously independent entities; an information system that will clinically and financially integrate the system; a clinical support system that emphasizes clinical efficiency and patient-focused care; and an actuarial approach to healthcare planning. The IHS's human resource challenges include recruiting and retaining administrators to initiate and manage complex arrangements among acute, subacute, long-term, and ambulatory care services; requiring governance to be proactive, structured, and focused on the resources and services of the entire system versus individual entities; and preparing physicians for the transition from independent fee-for-service ambulatory and hospital practices to integrated, clinically efficient managed care.

These researchers further state that external factors will influence and alter the life cycle of the organization. The keys are to continue to reexamine and reinvent the integrated system to better meet the needs of its community and to plan for contingencies that may arise from the external factors.

FUTURE EXPECTATIONS

How then can a forward-thinking healthcare organization continue to reinvent itself and remain a vibrant, contributing member of its community? According to some thinking, integrated healthcare systems are failing at an alarming rate, at a time when other industries that have long attempted integration (such as manufacturing, telecommunications, and services) are refocusing on core competencies.

According to Friedman and Goes,^[10] the reasons for failure are both structural and functional:

Structural problems:

- Information system conflicts.
- Focus on hospital/physician/payer rather than on the patient.
- Unwillingness of network partners to surrender autonomy.
- Inefficient supply chain processes.
- Supremacy of financial performance measures.
- Difficulty in determining and measuring meaningful outcomes.

Functional and process problems:

- Misalignment of cultures and incentives.
- Problems associated with building trust between and among key stakeholders.
- Inadequate time and attention paid to managing employee responses to change.
- Problematic leadership.
- Uncertain vision of the desired outcome.
- Lack of overall organizational commitment and understanding.
- Poor or inadequate communication.

Focusing on community as well as organizational needs is critical to integration effectiveness. If the community needs a large network of primary care providers and the organization is attracting specialists,

it will not be competitive. Similarly, reengineering the cost of healthcare delivery at the expense of community programs will disconnect the healthcare network from its greater purpose. Improved communications and requisite data collection will similarly meet community needs. As community report cards become more widely used, providing and maintaining measurable and superior healthcare quality which responds to community needs will become the true measure of integrated network strength.

Internal Controls

Robert W. Smith

Department of Political Science, Clemson University, Clemson, South Carolina, U.S.A.

INTRODUCTION

Internal controls are typically treated as a narrow specialization within or under broader fields such as organizational theory, management, accounting, auditing, or budgeting and financial management. However, internal controls are better understood as a thread running through each of these fields rather than as a separate concentration. Organizations as diverse as the U.S. General Accountability Office (GAO),^[1] the New York State Office of the State Comptroller (1999), and the University of California^[2] define internal controls as “An integral component of an organization’s management that provides reasonable assurance that the following objectives are being achieved: effectiveness and efficiency of operations, reliability of financial reporting, and compliance with applicable laws and regulations.” (See p. 3 of Ref.^[1].) Hence, internal controls constitute both the tools and processes that help public managers achieve effectiveness and efficiency while avoiding serious problems such as overspending, operational failures, and violations of law.

EVOLUTION OF INTERNAL CONTROLS

Internal controls have been around throughout the history of large organizations. In the private sector, the original purpose of internal controls was to protect against misuse of assets, overspending, or even theft by employees.^[3] As commerce flourished, internal controls were viewed as an effective means of corporate command and control. In their 21st century application, internal controls are as much a part of the public and nonprofit sectors as they are of the private sector. In the United States, as systems of commerce evolved, so too did the federal government’s regulatory function and oversight responsibility for commerce and other societal activity. Concomitantly, the level of effort as well as the intricacies of internal control systems also advanced. As large public and private organizations were created in the 20th century, concerns over how best to manage, ensure accountability, and achieve efficiency in expanding and complex agencies and companies were paramount. To understand

why internal controls are an established feature of contemporary public administration, it is necessary to briefly examine the evolution of internal controls in federal, state, and local government as well as the private sector.

The first real advance in modern governmental financial management came with the creation of the Budget and Accounting Act of 1920 (BAA). This act created the National Budget, the Bureau of the Budget, and the General Accounting Office.^[4] As of July 7, 2004, the GAO’s legal name became the Government Accountability Office. Through the BAA, the federal government established that internal controls were necessary to combat misuse, waste, and fraud. “In 1929, the Federal Reserve Bulletin (first issued in 1917 to provide detailed instructions for preparing balance sheets) stressed reliance on internal controls and the use of testing, instead of detailed verification, when such internal control was deemed reliable.”^[3, p. 35] The American Institute for Certified Public Accountants (AICPA) defined internal control “as those measures and methods adopted within the organization to safeguard the cash and other assets of the company as well as to check the clerical accuracy of the bookkeeping” (*Examination of Financial Statements by Public Accountants*, 1936). The AICPA later revised its definition of internal controls in 1949 to include “the plan of organization and all of the coordinated methods and measures adopted within business to safeguard its assets, check the accuracy and reliability of its accounting data, promote operational efficiency, and encourage adherence to prescribed management policies.”^[3]

The federal government continued on its path of crafting legislation and regulations that mandated the implementation of internal controls with the passage of the Budget and Accounting Procedures Act of 1950. This act assigned responsibility for establishing and maintaining adequate systems of internal control to the heads of federal agencies. The act also required that: 1) agencies’ accounting systems and systems of internal control conform to standards set by the Comptroller General; and 2) all such systems be approved by him.^[4] The 1950 act had little success. Elmer B. Staats, former U.S. Comptroller General (1966–1981), explained the reasons for the failure of the act:

The reason internal control systems are in a state of disrepair is that top management has devoted most of its concern and emphasis to delivering funds and services and that effective controls over tasks and functions which lead to the delivery of these funds and services had a low priority. Because of top management's insufficient concern for internal controls, middle management reflects this same indifference.^[4]

Concerned with financial and accounting turmoil in the 1970s, the federal government once again tried to step in to establish some uniformity of internal controls within the various federal agencies. The Inspector General Act of 1978 created the post of Inspector General in 12 federal agencies that combined the auditing and the investigation forces under one authority, which would report to the agency head as well as to Congress.^[4] Later, in 1982, the Federal Managers' Financial Integrity Act provided a strong stimulus for government managers to insist upon sound management systems, including both internal administrative and internal accounting controls.^[4] This Act also mandated that the GAO issue standards for internal controls in government.^[1]

Although the federal government had taken the more visible lead in the internal control movement up to the mid-1980s, the private sector continued to utilize internal controls, but in a more decentralized fashion. This all changed with the creation of the Committee of Sponsoring Organizations (COSO) of the National Commission on Fraudulent Financial Reporting, commonly known as the Treadway Commission, a private-sector initiative that was launched to understand the factors leading to the rising incidences of fraudulent financial reporting in the 1970s and 1980s. The committee issued *Internal Control—Integrated Framework*, which recognized the seriousness of the issue, of not having a common agreement on how to define internal control and not having a set standard that entities could consult to determine whether their own internal control system was effective. "The report presented a common definition of internal control to meet the needs of diverse users and provides a framework against which entities can assess and improve their internal control systems."^[5]

The federal government embraced this definition and related developments. Additional federal legislation has assisted in the continued evolution of internal controls as well as an increased awareness and compliance on the part of government managers. The Chief Financial Officers Act of 1990 called for financial management systems to comply with internal control standards, the Government Performance and Results Act of 1993 required agencies to clarify their missions, set strategic and annual performance goals, and measure and report on performance toward those goals,

and the Federal Financial Management Improvement Act of 1996 identified internal control as an integral part of improving financial management systems.^[1]

"Since the passage of the Single Audit Act (SAA) of 1984; the 1988 revision of the GAO *Standards for Audit of Governmental Organizations, Programs, Activities, and Functions* (The 'yellow book'); and the adoption of Statements on Auditing Standards (SAS) Nos. 53, 54, 55, 60, and 63, a greater emphasis has been placed on the quality of internal controls and the related reporting process."^[6] These mandates have the single purpose of assuring the public that government resources are being used efficiently, economically, and effectively, and are free from waste, abuse, or fraud.

The Single Audit Act of 1984 (SAA) and the Single Audit Act Amendments of 1996 required each audit of a governmental body to encompass the entire financial operation of the entity. As expanded in OMB Circular A-128, auditors must conduct a study and evaluation of the internal control systems used in administering federal assistance programs. The review and evaluation require auditors to test whether the internal control systems are functioning in accordance with prescribed procedures. The auditor's report on the internal control systems must identify the organization's significant internal accounting controls and those controls designed to provide reasonable assurance that federal programs are being properly managed. The report must also identify the controls that were not evaluated and the material internal control weaknesses identified as a result of the evaluation (OMB Circular A-128). Statement of Auditing Standard 55 and OMB Circular A-128 also require a compliance report, which identifies any noncompliance with laws and regulations by the governmental entity that may have affected the use of federal funds.

There is no better evidence of the imperative of internal controls in modern organizations than the passage of the Sarbanes-Oxley Act in 2002 (PL 107-204; see <http://corporate.findlaw.com/industry/corporate/docs/publ107.204.pdf> for a full text of the law). Following in the wake of corporate scandals, Sarbanes-Oxley does many things to address abuses, but section 404 of the Act specifically addresses internal controls. Subsequent regulatory actions by the Securities and Exchange Commission corporations are required to file reports assessing internal controls over financial reporting (<http://www.sec.gov/news/press/2003-66.htm>). In addition, the International Organization for Standardization (ISO), which is a network of national standards institutes for 148 countries, issued ISO 9000 in 1987. Although ISO 9000 focuses on quality management systems, it has the effect of providing standards for an integrated internal control system (see <http://www.iso.ch/iso/en/iso9000-14000/iso9000/>

iso9000index.html). Updated in 2000, these international standards utilize eight quality management principles that organizations can certify to that in large measure parallel requirements of an internal control system.

DEFINING INTERNAL CONTROLS

The federal government, as well as many state governments and other organizations concerned about internal controls, have embraced the COSO-based definition. A host of other professional bodies have built upon this definition to guide their efforts. For example, internal control organizations such as the Financial Reporting Council of the London Stock Exchange (the Cadbury Report), the Criteria of Control Board of the Canadian Institute of Chartered Accountants (COCO), the International Organization of Supreme Audit Organizations (INTOSAI), and the Information Systems Audit and Control Association (Control Objectives for Information and Related Technology—COBIT) embrace the COSO definition of internal control:

Internal control is a process, effected by an entity's board of directors, management and other personnel, designed to provide reasonable assurance regarding the achievement of objectives in the following categories: effectiveness and efficiency of operation; reliability of financial reporting; and compliance with applicable laws and regulations. (From <http://www.coso.org/key.htm>.)

While there are both similarities and differences among these documents (COSO, COCO, INTOSAI, Cadbury Report, and COBIT), they are consistent in contending that internal control has taken on a new and expanded meaning . . . that affects virtually every aspect of an organization's operation (New York, 1999).

The standardized COSO-based definition is built on several fundamental concepts. These concepts are that internal control is a process, a means to an end, not an end in itself. Also, internal controls are affected by people; therefore, they are reliant upon the actions and decisions made by all levels of an organization.^[7] Internal control is a basic element that permeates an organization, but is not just an addition to it; it incorporates the qualities of good management; and internal control provides a level of comfort to an organization but does not guarantee success (State of New York, 1999).

Most government organizations use the five major components of internal control outlined by COSO that apply to all aspects of an organization's operations: programmatic, financial, and compliance. These components

are necessary in that by accomplishing them, the organization is one step closer to having a truly effective internal control system. The components outlined are: control environment, communication, assessing and managing risk, control activities, and monitoring (Fig. 1) (State of New York, 1999; Commonwealth of Massachusetts, 2000).

The *control environment* is defined as “the attitude toward internal control and control consciousness established and maintained by the management and the employees of the organization” (State of New York, 2000). The control environment is essentially composed of the organization's management philosophy, style, supportive attitude, competence, ethical values, integrity, and morale. *Communication* is defined as “the exchange of useful information between and among people and organizations to support decisions and coordinate activities.” A key component of communication is that information must be transferred to management and the employees within a reasonable time frame to allow them to achieve the organization's goals. *Control activities* are defined as “the tools—both manual and automated—that help prevent or reduce the risks that can impede accomplishment of the organization's objectives and mission.” Examples of such control activities are documentation, approval and authorization, verification, supervision, and separation of duties. The fourth component to internal control is that of monitoring. *Monitoring* is defined as “the review of an organization's activities and transactions to assess the quality of performance over time and to determine whether controls are effective.” A key factor to note within the monitoring component is that everyone within

Fig. 1 COSO model. (Reprinted with permission from COSO.)

an organization has some responsibility for monitoring, and the focus of that individual depends upon the position held. The final component is that of *assessing and managing risk*. Risk is defined by the State of New York as “events that threaten the accomplishment of objectives.” Therefore, risk assessment and management is “the process of identifying, evaluating, and determining how to manage these events.” Management should identify and evaluate each risk in terms of significance, likelihood, and cause, and they must therefore provide safeguards against the most qualifying of these assessments.

INTERNAL CONTROLS IN THE FIELD: SELECTED STATE EXAMPLES

The State of North Carolina offers its agencies and smaller government entities an outline of expected policies to be adopted in order to maintain “reliability of financial reporting, efficiency and effectiveness in operations, compliance with applicable laws and regulations.” (See p. 3, 4 of Ref.^[8].)

The State Auditor’s Office (SAO) in the State of Texas builds upon the COSO concept by including a self-assessment program. “The effect of the action would be to expand management’s understanding of the controls, provide more knowledgeable people to assist in controls resources and expand the utility of the internal audit function.”^[9] The state suggests that agencies and local governments use a risk assessment methodology that includes all levels of management. This would result “in a more accurate and comprehensive risk assessment; fewer special projects to interrupt the audit plan; and more effective use of internal audit resources.”^[9]

The Commonwealth of Massachusetts’ Office of the Comptroller’s *Internal Control Guide for Managers* and also *An Act Relative to Improving the Internal Controls Within State Agencies*^[10] outline six standards for internal control for departments. Those six standards are: documentation, transaction management, authority, segregation of duties, supervision, and access privileges. These six standards overlap greatly in the areas of financial management, overall management, and auditing. The guide then briefly discusses both the department’s and the state auditor’s responsibility in the department’s internal control system.

Finally, the State of New York, through the Office of the State Comptroller and the Division of the Budget, identifies and issues its departments certain internal control standards. Although the Comptroller’s guide relates the importance of internal control systems in budgeting, financial management, and auditing, its clear focus is on that of management. “To some degree, everyone in an organization has the responsibility

for ensuring the internal control system is effective. However, the greatest amount of responsibility rests with the managers of the organization.” (See p. 6 of Ref.^[11].) Simply put, the organization’s top executive has the ultimate responsibility for the effectiveness in operations of the internal control system, since he/she has been entrusted with achieving the organizations goals. The *Standards for Internal Control in New York State Government* state, “the strength of the system of internal control is dependent on people’s attitude toward internal control and their attention to it. Executive management needs to set ‘the tone at the top’ in this regard.”

Further refinement of New York State’s internal control system led to the creation of Internal Control Officers (ICO), similar to positions in the Commonwealth of Massachusetts (see <http://www.nysica.com/>). The main responsibilities of these officers are to establish a system of internal control, review process and management policies, and implement education and training concerning internal controls. Even with a clearly identified internal control position, the guidelines reiterate that “it is management’s responsibility to establish the internal control system and for preventing breakdowns from occurring.”

INTERNAL CONTROLS IN THE FIELD: SURVEY RESULTS

A recent survey of state governments shows some interesting trends in how internal controls are utilized in the responding states.^[12] The 12-question survey was designed to assess the current “state of the state” of internal controls in the 50 U.S. states. Senior central budget office staffs in all 50 states were sent the survey. Twenty-two states responded—a 44% return rate—with one state responding from three different offices (budget, auditing, and accounting offices). First, 44% of the responses stated that the controller, comptroller, or treasurer had primary responsibility over the internal control system, and another 32% responded that internal control was decentralized to individual agencies. Only 12% responded that the central budget office had primary responsibility over the state’s internal control system.

Another finding was that only 56% of respondents believed that each state agency had one individual primarily responsible for internal control implementation and oversight. This finding shifts attention to the issue of dispersion of internal control implementation and oversight, and the potential consequences that arise when a multitude of individuals are responsible for the internal control system.

Survey respondents believed that their internal control environment was strong; yet, only 60% agreed or

strongly agreed. At the same time, 84% of respondents believed that their internal control system was used to make improvements in the state or agency operations. However, 40% of respondents agreed or strongly agreed that internal controls are viewed primarily as a financial control rather than a part of daily management operations. Moreover, 32% of the respondents agreed that internal controls and related reporting requirements are viewed as extraneous or supplemental to budgeting or managerial responsibilities.

This survey suggests that internal controls have been widely implemented by state governments, but to varying degrees. A preliminary observation about the states included in the sample was that the responsibility for internal control was largely decentralized to individual agencies. This would seem to indicate that states embrace the notion of internal controls being the responsibility of front line managers, but most states still retained a level of centralized oversight and control over the process. This opens a question about the diffusion of responsibility for internal controls in state government and who is ultimately responsible for internal control failures. With respect to the utility of internal controls for management improvement in state government, the survey suggests the linkage to such improvements is problematic at best.

CONCLUSIONS

Although a single definition is possible and identification of key elements can be presented to describe internal controls, it is nonetheless more accurate to say that internal controls are not one concept or even one process—they are the application of multiple concepts and processes that seek to enhance an organization's efficiency and effectiveness. In many respects, internal controls represent the best of what a management command and control structure has to offer, but at the same time, internal controls embrace empowerment of all organizational actors as responsible for

efficiency, effectiveness, and accountability. Hence, internal controls represent a powerful, underutilized, and little understood tool in the repertoire of managers across all sectors and types of organizations.

International Public Sector Accounting Standards

James L. Chan

*Department of Accounting, University of Illinois at Chicago,
Chicago, Illinois, U.S.A.*

INTRODUCTION

International Public Sector Accounting Standards (IPSAS) are financial measurement and reporting rules recommended for adoption by governments around the world and are promulgated by the Public Sector Committee (PSC) of the International Federation of Accountants (IFAC).

Government officials should care about IPSAS for practical reasons. Their governments are directly or indirectly urged to consider adopting IPSAS. If a country already has government accounting standards, convergence or harmonization with IPSAS is recommended. Scholars in public administration and public policy, especially those specializing in budgeting and financial management, would find IPSAS intriguing. International Public Sector Accounting Standards represent a new kind of government accounting that challenges the traditional superiority of budgeting over accounting in government, and the conventional notion that budgeting and financial management practices are government's own business.

After identifying the political and economic forces that have led to the emergence of IPSAS, the article describes the institutional structure and process for setting IPSAS. The standards are explained in non-technical terms and commented upon. Implications for public administration are stated in the Conclusion.

POLITICAL AND ECONOMIC FORCES

The winds of democracy and market economy sweeping the globe during the last two decades have encouraged government accountability and transparency.^[1] These two values are the foundation for the practice of accounting and auditing in the public sector. Even when it is narrowly and condescendingly regarded as glorified bookkeeping, accounting can still contribute to government fiscal accountability by requiring accurate financial recordkeeping of public money received and spent by government. The creation and preservation of such audit trails could deter corruption and graft—violations of elementary fiscal accountability.

The modern practice of government accounting is much more than financial recordkeeping. It can facilitate sound financial management by making sure that

the budget is faithfully and efficiently executed through authorized transactions and effective government actions. In particular, financial accounting in government is the systematic process of identifying, recognizing, and measuring the financial consequences of these government transactions and actions. Up to this point, accounting, even at its best, is only an adjunct to administration: the information lies inside government. As such, the information helps the government manage its financial affairs, but it does not help stakeholders hold government accountable. Stakeholder groups include legislators and regulators; voters, taxpayers, and the general public; creditors and investors in government securities; employees and vendors; and grantors and donors. All these stakeholders provide economic and political resources to government, thereby acquiring the right or need to know its finances.

The contemporary interpretation of the scope of accounting extends to financial reporting, especially to those who have the political right to know and economic need to know and yet lack the authority and resources to demand information. Accounting thus has become both a product and an enforcement mechanism of democratic accountability in the political system and of economic reciprocity in a market economy. These are the values championed by Western democracies, and by the international institutions they support and dominate especially in the post-Cold War era. No matter how imperfect democracy is and how poorly the market economy work in a particular country, as normative ideals they have inspired what has been called “a global revolution in government accounting.”^[2]

The revolutionary thinking in government accounting has several key elements. 1) Governments should issue audited financial reports shortly after the end of a fiscal year. Most governments prepare budgets, but not all prepare and make public financial reports derived from their accounting systems to serve as a factual check on the budget. 2) Financial reports should not be limited to cash receipts and disbursements, but should report the government's economic resources and short- and long-term liabilities. This would be a major departure from the traditional cash budget.^[1] Government accounting and reporting rules should be set by independent bodies and not by governments themselves. Year-end financial reporting on

the organization as a whole on the accrual basis in accordance with generally accepted accounting principles (GAAP) is required of public and private institutions in the United States and developed countries in the British Commonwealth. The “global” dimension of the revolution reflects the influence of these countries on the international and financial institutions that provide financial and technical assistance to developing countries and those in transition to a market economy.

It is also the case that Anglo-American private-sector accountants and auditors have the tradition of involvement in government. The involvement takes several interrelated forms. Their professional bodies might be directly or indirectly involved in setting government accounting standards. They might appoint a technical committee, or cosponsor a standard-setting body. Or they might designate the authoritative bodies for promulgating GAAP. These principles are used by their members to evaluate the quality of financial statements in order to express audit opinions. When governments engage private-sector auditors to audit their financial statements, accounting professional groups have considerable leverage over governments. This relationship between the accounting/auditing profession and government is elevated to the international level in creating the mechanism for setting IPSAS.

STANDARD-SETTING INSTITUTION AND PROCESS

The IFAC is worldwide alliance of 156 accountancy bodies in nearly 120 countries.^[3] The IFAC’s PSC, with financial support of several international organizations, began a standards program in 1996 to promote government financial accountability and performance through better accounting and financial reporting.^[4]

The committee currently (in the year 2004) has part-time members from Australia, Argentina, Canada, France, Germany, Israel, Japan, Malaysia, Mexico, the Netherlands, New Zealand, Norway, South Africa, the United Kingdom, and the United States. Before its current French chairman took office, the committee had been chaired by a Canadian, a New Zealander and an Australian. The committee has a small full-time staff and is assisted by the volunteer efforts of a large number of consultants and participants on its Consultative Group and Steering Committees for various technical projects.^[5]

International Public Sector Accounting Standards are set through a due process. Research is undertaken and deliberations are held before tentative positions are adopted. Exposure drafts of proposed standards

are disseminated to solicit the views of interested parties. These views are considered in revising and finalizing a standard. While the primary purpose of this process is to improve the quality of the standards, a side benefit is a greater understanding and support for the final standards and the institution for setting IPSAS in general. All the committee’s documents are available online for free downloading.^[6]

Financial support for the committee’s standard-setting project has come from the International Monetary Fund, the World Bank, the United Nations Development Program, and the Asian Development Bank. Institutional collaboration, but not funding, is provided by a group of observers: the International Organization of Supreme Audit Institutions, Organization for Economic Cooperation and Development, International Accounting Standards Board, and the European Commission.^[7]

The issue of IFAC/PSC’s future was recently addressed by a review panel named by the IFAC and chaired by an external chairman. The panel has recommended that the committee be renamed the IPSAS Board and that it continue to develop additional standards.^[7] Such a structure would require continued funding from organizations interested in increased quality of external reporting by governments. Since IPSAS have attributes of public goods, their production and dissemination will have to rely on the donors identified above. These organizations stand to benefit from reliable government financial data, and, if they choose, could require IPSAS be used in accounting for their loans and other forms of assistance.

INTERNATIONAL PUBLIC SECTOR ACCOUNTING STANDARDS

As of August 2004, IPSAS consists of 20 standards: two on accounting measurement issues; 8½ on financial reporting issues; and 9½ dealing with specific transactions or items in financial statements.^[5] These standards are highly technical and are almost impossible to understand without a working knowledge of financial accounting. As a whole, IPSAS are impossible to assess without examining their basic assumptions. Consequently, this section will state the essence of IPSAS without attempting to summarize individual standards (see Table 1 for key terms); it will also try to discern the premises underlying the standards.

The PSC believes that governments should prepare government-wide (consolidated) financial statements. These general-purpose statements are intended for users who lack the ability to request specific information. A complete set of financial statements would describe the government’s financial position,

Table 1 Key terms in financial accounting and reporting*Financial reporting*

Reporting entity: consists of one or more organizations whose finances are of interest to intended users of a financial report.

Financial statements: report the recognized effects of transactions and events, consisting of statements of financial position and of financial performance, and of cash flows.

Government-wide (or consolidated) financial statements: financial overview of the government as a whole, after eliminating the effects of internal transactions.

General-purpose external financial statements: intended to be the primary source of historical financial information to users outside of an entity, prepared with generally accepted accounting principles.

Financial report: financial statements and other financial disclosures.

Financial position: as of a particular date, an entity's net assets are its assets offset by its liabilities.

Financial performance: changes during a period in an entity's amount of net assets, as measured by revenues net of expenses.

Cash flows: sources and uses of cash from operating, financing, and investing activities.

Financial accounting measurement

Transactions: the primary source of financial accounting data, exchanges of economic considerations between two or more parties.

Event: a significant occurrence that has direct or indirect consequences to an entity.

Financial consequences: impacts on an entity's financial position and performance or cash flows.

Elements of financial statements: indicators of financial consequences and therefore major components of financial statements: assets, liabilities, revenues, and expenses.

Assets: range from cash to any economic resources capable of producing future benefits.

Liabilities: obligations to pay in cash or to provide services due to having received benefits.

Revenues: increases in assets (or decreases in liabilities) attributable to service efforts and accomplishments or government's power to tax.

Expenses: assets used or liabilities incurred in the course of generating revenues or providing services.

Realization: financial consequences having been confirmed by an actual transaction or event.

Recognition: the decision and action to formally acknowledge certain financial consequences in the accounts and financial statements.

Cash basis: measures financial performance in terms of cash receipts and disbursements.

Accrual basis: in contrast to cash basis, broadens revenue to include receivables (claims against customers or taxpayers) and expenses to include non-cash resources used and incurrence of liabilities.

Matching: offsets revenues by related expenses to arrive at a net periodic measure of financial performance (i.e., income or loss).

financial performance, and cash flows. Comparisons with the budget are encouraged but not required. The reporting entity should encompass the entities owned and controlled by the government. Appropriate disclosures should be made about distinguishable segments within the government, as well as the government's financial relationships with other entities.

The information in financial reports is produced by the financial accounting system of an entity. The primary function of financial accounting is to recognize and measure the financial consequences of past transactions of an entity and of the events that directly affect it. The consequences are measured by a number of financial variables. The accounting equation "assets minus liabilities equals net assets" describes financial position. Financial performance is measured by revenues and expenses, and therefore income or loss. The inclusion of non-current assets and liabilities is necessary to fairly portray a government's

financial position at the end of the period. The accrual basis of accounting provides a more accurate measures of service effort and accomplishments than does the cash basis of accounting. The use of the accrual basis requires a complementary statement of cash flows from operations and investing and financing activities to show changes in the government's liquidity position.

The key terms in Table 1 and the above description are intended to help readers put the individual IPSAS in a better organized framework. The first three IPSAS describe the form and contents of the three financial statements that constitute general-purpose financial statements. After that, the sequence of the individual statements does not reveal any discernible pattern. As a remedy, Table 2 differentiates general and specific standards. The very small number of standards on the important topics of recognition and measurement is noticeable.

Table 2 Structure of current IPSAS (number and issue date)*General recognition and measurement standards*

- Revenue from exchange transactions (no. 9; 2001)
- The effects of changes in foreign current exchange rates (no. 4; 2000)

General reporting standards

- Presentation of financial statements (no. 1; 2000)
- Cash flow statements (no. 2; 2000)
- Consolidated financial statements and accounting for controlled entities (no. 6; 2000)
- Segment reporting (no. 18; 2002)
- Financial reporting of interests in joint ventures (no. 8; 2000)
- Related party disclosures (no. 20; 2002)
- Financial reporting in hyperinflationary economies (no. 10; 2001)
- Events after the reporting date (no. 14; 2001)
- Fundamental errors and changes in accounting policies (no. 3; 2000)

Standards on specific transactions and items

- Financial instruments: disclosure and presentation (no. 15; 2001)
- Accounting for investments in associates (no. 7; 2000)
- Inventories (no. 12; 2001)
- Investment property (no. 16; 2001)
- Property, plant, and equipment (no. 17; 2001)
- Lease (no. 13; 2001)
- Provisions, contingent liabilities and contingent assets (no. 19; 2002)
- Construction contrasts (no. 11; 2001)
- Borrowing costs (no. 5; 2000)
- Net surplus or deficits for the period (no. 3; 2000)

In addition to the standards in Table 2, in response to some countries' inability or reluctance to adopt the preferred accrual basis, a standard on how to account and reporting under the cash basis was also issued. This is, however, regarded as an interim measure since all countries are urged to move to the accrual basis, even though many conceptual issues and implementation obstacles remain.

The standards in Table 2 are the products of Phase 1 of the PSC's standards program from 1996 to 2002. They are said to constitute a "core" set of IPSAS for public sector entities. This is an overstatement because those standards hardly address the core issues in government accounting. The core issues in government accounting have to do with the unique characteristics of government: the power to tax, the production of public goods, virtually limitless responsibility, unfathomable public property (at least in financial terms), and the disclosure of budgets prior to the fiscal year (a norm in Western countries).

If the standards are to be useful for developing countries and transitional economies, the standards would have to deal with issues that connect business

and government. These concern the shifting boundaries between public and private sectors, the conversion of some public property to private property, government subsidies for state-owned enterprises, government assumption of debts of failing or failed enterprises, etc. The list can go on. These are not easy and technical accounting issues, because the institutional mechanisms for defining and enforcing legal and contractual rights and obligations are either weak or non-existent. Precisely for this reason, the research and development of accounting standards could be instrumental in reinforcing the political, economic, and institutional infrastructure of accountability.

Phase 2 of the PSC's standards program from 2002 to 2005 is addressing some of the issues unique to the public sector. These include: 1) whether and how budgetary information should be included in financial statements; 2) non-reciprocal revenues, such as taxes, grants, and transfers; 3) social policy commitments, such as social insurance; 4) assistance to developing countries; 5) heritage assets; and 6) public/private-sector construction/financing arrangements.^[4,5] Information about the current status of these projects as well as the committee's activities is available from the Internet (www.ifac.org).

The structure and contents of the first 20 IPSAS are based on several assertions. First and foremost is the belief that it is possible and desirable to have a single set of financial accounting and financial reporting standards for both business and government. Even though terms like convergence and harmonization are used, in practice, the current IPSAS are modest adaptations of business accounting and financial reporting standards promulgated by the International Accounting Standards Committee (now Board). Second, the PSC, being an international professional group, should focus on external financial reporting by government. By implication, compliance with legal, budgetary, and contractual requirements and support for financial management are outside of the PSC's concern. Third, it is appropriate to take the incremental approach by setting IPSAS one by one; a conceptual framework is in effect regarded as a luxury not as a necessity. These are debatable points. One might argue on the contrary that: there are numerous and critical differences between government and business; a government accounting systems have both internal and external missions; and a conceptual framework is essential for ensuring coherent and consistent standards.^[1,8]

CONCLUSIONS

International Public Sector Accounting Standards are in essence the worldwide accounting profession's advice to governments on how to report to the public and other

external parties. Based on the premise that government accounting should be as similar to business accounting as possible, they reflect Anglo-American thinking and practice. As such, the United States and developed nations in the British Commonwealth already comply with the spirit, if not the letters, of IPSAS. Other developed nations may, but do not have to, adopt IPSAS unless they are persuaded as to the merits of these standards. However, developing countries now do not have such discretion. According to the IFAC, the World Bank has accepted IPSAS for preparing financial reports on activities financed by the bank.^[5] If other international donors and lending institutions follow the World Bank precedence and begin to require IPSAS, developing countries will have to consider whether to embrace IPSAS as government-wide accounting rules.

Such a decision will not be easy, in part because IPSAS are still a work in progress: standards addressing unique government issues are still being formulated. If the PSC continues to use the incremental approach, individual standards will be issued over a long period of time. Changing government accounting systems to comply with IPSAS will predictably be a prolonged and costly process. Budget directors and chief administrators responsible for approving and justifying the costs to legislatures may soon be asking: what price is more, even if better, accounting? While it is laudable to demonstrate external accountability to external users with financial statements, should not more resources be devoted to forward-looking

planning and real-time financial control system? Answers to these questions may be too important to be left to accountants. It behooves public administrators and legislators to monitor and participate in the development of national and international government accounting standards.

Inventory Management

Ronald John Hy

*College of Arts and Sciences, Texas A&M University-Kingsville,
Kingsville, Texas, U.S.A.*

INTRODUCTION

Sound inventory management is designed to save money by minimizing inventory costs. Inventories are items—such as building materials, office supplies, and chemicals, to name a few—that are used to produce products and/or services. Managing inventories efficiently is important because inventories are among the largest non-wage expense of most public and non-profit agencies.^[1]

Inventory management saves money by purchasing as inexpensively as possible the optimal number of needed items so that they are always readily available, but in an amount that minimizes storage and holding costs. Having a sufficient number of items readily available, therefore, must be balanced against the cost of storing and holding items.

Inventory management requires:

- Preparing specifications, obtaining competitive bids, negotiating, and receiving items
- Buying specific items
- Monitoring the deterioration, obsolescence, storing, issuing, theft, handling, interest, and insurance of items
- Overseeing the storage and holding costs of items.

The most common mistakes made by inventory management are:^[2]

- Stocking too many items
- Stocking items which are seldom, if ever, needed
- Failing to balance purchasing cost and storage costs
- Failing to consider the full cost of holding inventories

Sound inventory management, then, controls costs and thereby saves money by determining the number or amount needed to be readily available, while keeping storage cost to a minimum. Inventory management also contributes to the availability of working capital, which refers to the organization's short-term or current assets (e.g., cash, short-term marketable securities, accounts receivable, and inventories). Spending as few dollars as needed on inventory allows an agency to spend more money on products and/or services,

to invest more money for future use, or to pay off current debts.

VALUING INVENTORIES

In terms of accounting, inventory usage either is first-in, first-out (FIFO) or last-in, first-out (LIFO). With FIFO, the oldest items in the inventory are used first. With LIFO, the newest items in the inventory are used first. Using one of these two systems is necessary because each item in an inventory is not labeled individually. Thus, when similar items have been purchased at different prices, which frequently is the case, the price of each particular item may not be readily known, just the price of a group of items. For example, if the purchasing department buys a chemical at \$5 an ounce at one time and \$6 an ounce at another, it probably does not know which chemicals were purchased at \$5 and which were bought at \$6 because in storage the two shipments are ordinarily mixed together. Purchasing, however, surely knows how many chemicals were bought at \$5 and how many were bought at \$6. Therefore, to keep track of costs the agency has to use a consistent policy, either FIFO or LIFO. A consistent, systematic policy is the only way to keep an accurate record of actual inventory costs.

Under FIFO, the first item leaving the inventory is costed at the newest price in the inventory. Consequently, the value of the inventory at any point in time is determined by the most recent cost of the item. Under LIFO, the first item leaving the inventory is priced at the most oldest price in the inventory. In inflationary periods, using the higher-priced item has a decided advantage over using the lower-priced item because the most expensive items are used first and the least expensive items are held in inventory. Last-in, first-out pricing lowers the value of the inventory over time. Consequently, not as much money is tied up in inventory, and the inventory cost is less. Last-in, first-out pricing also allows the agency to increase reimbursable costs.^[3]

Besides lowering costs and saving money, inventory management keeps inventories amply stocked. Because the time lag between ordering and receiving some items is sometimes substantial in terms of money, time, and

even life, it is important that these items be available for immediate use. An agency cannot always project with certainty the number of items that will be needed at any given time. Therefore, to meet the demand and ensure the continuation of services, inventories must be kept suitably stocked. If a sufficient number of cast iron pipes and fittings are not readily available, then water lines cannot be fixed even when personnel are available to work on the lines. A sufficiently stocked inventory will prevent such discontinuities from occurring.

COSTING INVENTORIES

Given the need to minimize inventory cost, an agency must decide on the optimal number of items to keep in inventory. Inventory management relies on various formulas that are based on certain assumptions of future behavior, as well as common sense and experience.^[4] Inventory cost consists of purchasing cost, order cost, carrying cost, overstock cost, and stock-out cost. The inventory formulas discussed in the following sections are taken from Breman, Kukla, and Weeks.^[5]

Purchasing Cost

Purchasing cost is the price paid for each item. This expense is essential. Even though an agency has little control over the price it pays for items (the price is set by the seller), it can reduce the purchase cost by buying in large enough quantities to qualify for a discount. The timing of the order, as well as its specifications and bidding procedures (when applicable), also influence the price of items. As a result, the price of any item should always be considered to some extent variable and negotiable.

The purchasing cost formula is:

$$\text{Purchasing cost} = PN$$

where:

P = price of each unit.

N = number of units purchased annually.

Order Cost

Order cost is direct expenses incurred when purchasing items, expenses such as writing specifications, letting and analyzing bids, preparing order forms, and receiving items. This cost normally is minimal, especially when items are standard and purchasing processes

routine. However, first-time, unstandardized orders do increase the order cost. The order cost, unlike the purchasing cost, varies with the number of orders placed, not the size of the order. Therefore, the order cost component of the inventory cost encourages large and fewer orders.

The order cost formula is:

$$\text{Order cost} = (D/Q)O$$

where:

D = number of units purchased annually.

Q = size of the order.

O = average cost of placing an order.

Carrying Cost

Carrying cost is the expense involved in holding items in the inventory. This cost actually consists of two elements: opportunity costs and storage costs. Opportunity costs are incurred when the organization spends money purchasing and holding items for inventory, instead of spending the money for something else that will reduce its operating cost (e.g., new equipment). Opportunity costs occur when an agency foregoes the opportunity to buy something other than inventory in favor of stocking the inventory. Generally, the greater the inventory cost, the greater the opportunity costs.

Besides opportunity costs, carrying cost includes storage costs, which are incurred when organizations, as they must, properly store, insure, secure, and otherwise protect their inventory. Storage costs tend to be positively related to the size of the inventory. As with opportunity costs, the larger the inventory, the larger the storage costs.

The carrying cost formula is:

$$\text{Carrying cost} = HQ + IP(Q/2)$$

where:

H = storage cost per unit, determined in much the same manner as rates are fixed.

Q = size of the order, usually the maximum number of items stored at any given time.

$IP(Q/2)$ = opportunity cost,

where:

I = interest.

P = price per unit.

$Q/2$ = average inventory holdings.

Overstock Cost

Overstock cost is the expense of holding unused or unneeded items in the inventory. This cost consists of surplus carrying costs and perishable costs. Surplus carrying costs exist when items are purchased for use in a particular time period, but are not used during that period. Thus, an agency is forced to pay an unexpected carrying cost for the surplus items until they can be used. Overstocking, therefore, contributes to an increase in the carrying cost.

The second element of overstock cost is perishable costs. Although perishable costs do not apply to most public and non-profit agency inventories, they do to some, especially foodstuffs and chemicals. If an agency overstocks and is unable to use a chemical before the expiration date, it incurs a cost similar to that of a tomato that must be discarded.

The overstock formula is:

$$\text{Overstock cost} = [HQ + IP(Q/2)] + S$$

where:

$HQ + IP(Q)/2$ = carrying cost.

S = perishable costs.

Stock-Out Cost

Stock-out cost is the expense incurred when there is an insufficient supply of a needed item. Keeping the stock-out cost minimal increases the inventory cost. This trade-off, however, is almost mandatory when avoiding stock-out is critical. Generally, public and

non-profit agencies seldom, if ever, experience this cost. They generally compensate by keeping substantial inventories on hand.

In summary, inventory cost (IC) is based on the following components:

$$IC = PN + (D/Q)O + [HQ + IP(Q/2) + [[HQ + IP(Q/2)] + S]$$

When using this formula, one should keep in mind that, according to Berman, Kukla, and Weeks, about 15% of inventory items represents 70% of the inventory value.^[5] Another 15% represent approximately 25% of the inventory value. The remaining 70% of the items account for only 5% of the inventory value. By concentrating on the 30% of the items representing 95% of the inventory and ignoring the rest, one can more readily and systematically estimate cost factors.

Israel Civil Society: Characteristics

Nitza Nachmias

School of Political Science, University of Haifa, Haifa, Israel

Amiram Bogot

Former Registrar, Non-Profit Organizations, Jerusalem, Israel

INTRODUCTION

In the early 1980s the term “civil society” (CS) turned into a “user friendly” theoretical tool, gaining great attention from scholars and practitioners alike. Known variously as “Non-profit,” “Voluntary,” “Third Sector,” and “Non-government Organizations (NGO),” civil society organizations (CSO) are operating outside the confines of the market and the state. This set of institutions provide a middle way between sole reliance on the market (the “second sector”) and sole reliance on the state (the “first sector”). CSOs, also known as NGOs, include a sometimes bewildering array of entities—hospitals, universities, social clubs, professional organizations, day-care centers, environmental groups, sports clubs, job training centers, human rights organizations, and many more.

The new CS approach has replaced both the Schumpeterian paradigm of democracy and the paradigm of the “welfare state.” A comparative study of CSOs in 22 developed countries shows that “even excluding religious congregations, the non-profit sector in 22 countries we examined is a \$1.1 trillion industry that employs close to 19 million full-time equivalent paid workers.”^[1] In Israel, as in most liberal democratic countries, the government pays third party service provider organizations to deliver social services to the citizens. These CSOs replace or complement public services in such areas as education, health, immigrant absorption, welfare, and culture. The practice of subcontracting and outsourcing of social services to CSOs follows the New Public Management (NPM) approach that maintains an intense sharing relationship between the government and a myriad of service providing CSOs. While the use of NPM in Israel has widened in the past two decades, the practice has gained both praise and criticism. New Public Management was hailed, mainly by politicians, for promoting democracy, effectiveness, and efficiency in the delivery of public services. But important regulatory and oversight institutions, namely, the state comptroller’s office (SCO), and the courts, voiced strong criticism regarding rampant fraud in the subcontracting procedures, and the unwarranted distribution of public funds to NGOs whose activities were neither necessary nor relevant to the public interest.

Notwithstanding the criticism, the CS in Israel is among the largest in the world relative to the economy as a whole. It takes fourth place among the 22 developed nations after Holland, Ireland, and Belgium, and its economic weight amounts to nearly one-tenth of the Israeli economic activity. However, research on the Israel CS has been limited and late in developing. Serious research began only in the 1990s, with the establishment of the Center for Non-Profit Organizations at Ben Gurion University, headed by Gidron. The rapid growth of the Israeli Third Sector has caught the government unprepared and unequipped to regulate, control, or oversee the burgeoning “civil society.” In fact, a tactical conflict has emerged between the Israel CSOs aspiring to maximize their public support while minimizing oversight, and the government aspiring to maximize its oversight while minimizing its cost. Our research shows that even though the government had introduced new and unique regulatory mechanisms, these bureaucratic and legal instruments need to be further strengthened to ensure the CS accountability.

THE ISRAEL CIVIL SOCIETY

The Israel CS includes over 30,000 registered non-profit associations of individuals who claim to share a common purpose with the rest of the members of the group. Many groups receive direct and indirect public support. The main characteristics of the diverse network of Israel CS are that: 1) they are required to incorporate by law for specific purposes detailed in their bylaws; 2) they must exhibit a firm bureaucratic structure and permanent governing institutions; and 3) they have to strive to achieve specific, detailed economic, social, or strategic goals. Finally, their activities have to be congruent with Israel national interest. Most of the Israeli NGOs’ activities concentrate on three areas: 1) education and research; 2) culture and recreation; and 3) religious activities. The Ministry of Finance (MOF) data show that the highest number of NGOs is found in the religion section. Indeed, 44% (10,358) of all the registered CSOs are Orthodox/Haredi, but only a quarter of them (2635) are

active. In contrast, in the late 1990s, only 1067, or 4.5% of all registered NGOs were Arab Israeli groups, and only 28% of them have been active. Between 1991 and 1997, the religious-orthodox education system received 37.2% of the funds transferred to all NGOs. In comparison, Israel's higher education CSOs received 3.6% of the total funds (Table 1).

Historically, the Jewish NGOs in the Diaspora provided all the social services for the community. This tradition continued in Palestine where between 1882—the year considered the beginning of the Jewish settlement in Palestine—and until 1948, a highly sophisticated network of NGOs functioned as an effective and efficient *bone fide* government, providing all the social services for the Jewish community in Palestine. The newly created state maintained the long tradition of support (financial and other) by Diaspora Jews for the Jewish community living in the Holy Land. During the first Israel coalition government headed by David Ben Gurion, special relationships have been established between the state and the orthodox NGOs. The government approved the religious parties' demand to grant their sectarian orthodox education institutions a national status, eligible for all the support and benefits granted to the Israel national-secular education system. Consequently, over 41% of Israel NGOs are orthodox educational institutions fully supported by the state, while the percentage of the orthodox people in the population is less than 20%. This thorny political issue has not been resolved either by the NGO Law of 1980, or the various government regulations that followed in the 1990s.

While the Israel CSOs have always played an important socio-economic role in the Israeli society, their importance has grown in the past two decades. This is clearly exhibited in the following data: In 2000, NGOs employed 10.7% of the Israeli work force

(non-agricultural work force), and produced 12.8% of the Israeli gross domestic product (GDP). The Third Sector employs 30,000 paid employees and an unknown number of volunteers. Between 1991 and 1995, the total NGOs expenditures grew by 13.5% reaching 33 billion new Israeli Shekel (NIS) (over US \$8 billion), and the number of their employees grew by 19,000. On the other hand, the number of government employees decreased by 22%, from 66,631 to 51,995.^[2]

The Israel government initiated intense partnership and shared responsibilities with the CSOs, creating an environment of “mutual dependence.” The CS has become greatly dependent on public funding for providing most of the education, health, and welfare services, while the state became greatly dependent on the social services provided by the CS. The research shows that “A high rate of 78% (4705 organizations) of the 6030 active CSOs engage in service provision. Only 5.7% engage in advocacy, and 5.8% are foundations funding NGOs.^[2] The government has increased its support of the Israel CS, and in 2004, transferred 36 billion NIS to non-profit organizations compared with 33 billion NIS in 1999. The MOF reported that the funds have been transferred as block and formula grants, but only about 10 billion are included in the regular budget. The rest are mandatory payments for healthcare and education, jointly paid by national and local governments. The subcontracting of services, from NGOs, not mandated by law amounted to only 6% of all the funds (Tables 2 and 3).

MINORITY NGOs IN ISRAEL CS: JEWISH ORTHODOX AND ISRAELI ARAB NGOS

The data shows that the Jewish orthodox NGOs are almost exclusively engaged in providing services

Table 1 Government grants to NGOs by ministries 2002–2004^a

Department	2002	2003	2004
Prime Minister	46,863	47,905	305,348
Interior	4,697,832	3,963,079	3,839,894
Education	1,388,469	1,196,543	1,513,911
Religion	1,223,054	1,053,534	3,005,485
Welfare	160,425	123,001	98,25
Health	98,089	24,032	6,191
Absorbition	34,002	31,602	28,774
Agricultural education	150,709	119,367	116,468
Science, culture, and sport	438,812	125,570	1,354,638
Total (NIS)	8,238,255	6,684,633	10,180,534

Additional, smaller amounts were granted by various national and local government departments.

^aIn millions of NIS. Grants under clause 3[a] in the regular budget. Numbers do not include subcontracts and indirect support.

Table 2 Funding for NGOs by categories of operation^a

Category	% of the total organizations	% of total public funding
Religious organizations	24	41.3
Education and research	19	17.2
Culture and leisure	14	11.4
Recreation and welfare	12	9.4
Philanthropy	8	3.2
Civic, legal, and political	6	1.3
Housing and development	5	0.6
Health	3	6.2
Labor unions and chambers of commerce	3	4.2
Memoriam	2	1.0
Environment	1	1.5
International activities	1	0.4
Non-Jewish religious NGOs	1	0.4
Others	1	2.4
Total	100	100.5

The categorization of the NGOs follows a universally accepted model developed by Salamon, L.M.; Anheier, H.K.; List, R.; Toepler, S.; Sokolowski, W. *Global Civil Society*; John Hopkins Center for Civil Societies, 1999: 1) Business and professional; 2) Civic and advocacy; 3) Community empowerment; 4) Culture; 5) Education; 6) Environment; 7) Health; 8) International operation; 9) Philanthropy; 10) Relief and social services; 11) Religious and congregations; 12) Unions; and 13) Others (in Israel, memorial organizations).
^aRatio between the volume of the organizations' activities and funds received.

(97%) in three areas: 1) religious activities (60%), mainly operating religious facilities for the exercise of religious ceremonies, e.g., "Miquveh," a bathing facility for women and "Kolel," a Talmudic school for bright young married men; 2) education and research

(24%), including private orthodox day schools for boys and girls, and operating Sunday schools and after-school religious programs; and 3) welfare (16%), including operating soup kitchens, free grocery centers, free kindergartens with three meals per day, among others. Thus, it is not surprising that registration rate of Orthodox education NGOs is growing faster than registration for secular education institutions. However, although Orthodox NGOs constitute almost half of the total number of Israeli NGOs they employ only 25% of all-paid employees.^[3]

The burgeoning trend revealed in the past two decades in the Israel CS is also evident in the Israeli Arab NGOs. The data shows that 65% of all Arab NGOs were registered during 1990–1998. However, the differences between the two ethnic groups are greater than the similarities. Among the Arab NGOs, advocacy organizations are especially noticeable: 7.3% compared to 5.7% in the entire network of NGOs. The number of NGOs providing civil services is also high. The main areas of activity are religion (24.5%), culture and recreation (22.2%), welfare (18.9%), and housing and development (13.9%). The rest 5% are mainly family associations. In contrast, educational activity (8%) is lower compared to the average in the entire NGO community (16%). The rates of Arab NGOs receiving direct government funding are similar to the rates of active organizations in the total CS population (roughly 5%). However, in terms of indirect support (donor's tax deductibles), the number was half compared to that of the entire CS population: 2.5% compared with 5.6%.^[3]

Since the outbreak of the second Intifadah ("Uprising") in 2000, the Israeli Arab NGOs have often adopted a confrontational attitude, in particular criticizing the government's lack of respect for their human and civil rights. The confrontational attitude is a result of a mutual distrust that has developed between the Jewish and the Arab communities in Israel, a mistrust that has yet to be resolved.

Table 3 Government formula grants to NGOs (in billions of NIS)

1992	2.14
1993	2.33
1994	2.28
1995	2.6
1996	3.06
1997	3.56
1998	4.04
2002	8.3
2003	7.29
2004	6.19

(From Berlinski, U.; Sofer, P. Government Support of NGOs and Public Institutions; 2000; Also MOF data 2002; 2003; 2004. Data not available for 1999; 2000; 2001.)

REGULATING, CONTROLLING, AND OVERSEEING THE ISRAEL CS

The massive transfer of resources and responsibilities from the state to CSOs increased in the 1990s, and in the financial year (FY) 2000, transfer of funds to NGOs amounted to 40 billion NIS, or 4.5% of the national budget. However, about half, or 20 billion NIS were payments for medical services (Kupot Holim). To oversee and regulate this process, the Israel Knesset (Legislature) created in 1980, the Office of the Registrar of NGOs within the Ministry of the Interior. The creation of the Office of the Registrar was part of

a new NGO law that addressed mismanagement and lack of accountability in the mushrooming network of NGOs. In 2004, the Registrar's office executed 12,322 random audits of NGOs. In 523 NGOs the Registrar's audit was done by 13 CPA companies. In 403 NGOs the audit found irregularities.

In 1985, the Knesset broadened the government oversight scope by revising the existing Budget Law and adding regulatory measures to eliminate fraud in the funding applications. The revised law imposes strict guidelines and criteria on applicants for public support, including a requirement for all applicants to submit a standard written grant application form that includes the names of the NGO officers and Board of Directors; a review of the NGO's operations in the last two years, and a recent audit approved by a certified public accountant (CPA). The CPA audit has to include a review of the NGO's financial responsibility—proper accounting and budgetary procedures—and show that the NGO executed its operation efficiently and effectively. Accountability has been particularly essential in the process of “subsidiarity,” namely, when social services are “translated into a system whereby private provision of services takes precedent over public efforts.”^[4]

Under “subsidiarity,” the government and the NGOs enter into explicit, legal arrangements that spell out the division of labor, responsibilities, hierarchies, chain of command, accountability, and financial obligations of each of them. For instance, several CS institutions have been authorized to conduct national tests and to certify physicians, CPAs, and lawyers. Burial services are also carried out by non-government, non-profit organizations. In 1995, and later in 1996, the NGO Law was amended to ban registered NGOs from applying for public funding to more than one government ministry for the same activity. The enforcement of this regulation was given jointly to the Registrar's office and the MOF. The MOF is required to issue annual reports, available in print and on the Internet, enumerating in great detail the grants allocated and the contracts awarded to every NGO. Another important reform in the Budget law was passed by the Knesset in 1992, requiring all grants to NGOs to be included in the regular budget under clause 3[a], and the information should be made available to the public. However, following the principles established by the first Israeli government coalition, the law included two exemptions: one for the Orthodox Spharadi, and the other for the Orthodox Ashkenazi educational institutions. Grants for these two CS ultrareligious organizations are not included in the regular budget, thus public exposure of the grants is lacking. The revised Budget law includes strict guidelines for the distribution of funds to the Third Sector. These guidelines require

all ministries and local governments that award grants to use objective and equal criteria to all applicants, and that the criteria be made public.

In 1998, a new regulation was issued requiring every NGO applying for public funds to hold a certificate of “Proper Management,” issued by the Registrar. This unique requirement ensures not only the NGO's adherence to the law, but also its adherence to proper operational norms applicable to all government agencies and departments. These norms ban nepotism, require a reasonable ratio between overhead and operational expenditures, and ensure that unlawful distribution of profits will not be carried out in the form of excessive salaries and fringe benefits.

The “Benchmark of Proper Management” also expects the NGO to operate with utmost efficiency and effectiveness. Only holders of a Proper Management certificate can apply for and receive public support. In addition, the Registrar can issue a “supported organization status,” an incentive issued to NGOs for good behavior. However, the road to the execution of the various important reforms has been rocky, at best.

CRITICISM OF THE ISRAEL CSOs

Since the late 1980s, the Israel CS has encountered some harsh criticism. A special committee appointed in 2000 by the Office of the Prime Minister to investigate possible widespread fraud in the CS aired the most important criticism. The Committee's findings were summarized on 9 August, 2000, and concluded that the government control mechanisms were insufficient partly owing to: 1) bureaucratic shortcomings; 2) lack of coordination among the ministries that either award grants or purchased services from CS; and 3) legal shortcomings. These weaknesses result in: 1) unlawful duplication of grants (an issue that was also raised by the Israel SCO)^[5] and 2) the practice of inequality, namely, the lack of clear and objective criteria for the formula grants,^[6] and the arbitrary manner in which a myriad of agencies, departments, ministries, and local governments have been allocating public funds to unwarranted NGO requests. Legal difficulties were also included in the report. The report enumerated severe shortages of qualified personnel at the Registrar's office, lack of cooperation among the various ministries providing funding for NGOs, and lax control of the subsidizing ministries of the NGOs receiving their support.

The NGO law is vague and allows for inconsistent interpretations. The law incorporates clauses from both the Ottoman and the British rule. Finally, the Third Sector had used the impressive political leverage that it had acquired to circumvent the law by using the

legislator as a tool to issue “special releases” for particular sectors.

CONCLUSIONS

While the activities of Israel CSO can be viewed as intensive and innovative, they are by no means unique. Since the mid-1980s, the processes of delivering social services have changed radically. The transformation of the Third Sector into the main provider of public services is a global phenomenon. Similarly, the NPM approach has become a universal practice. In Israel, as in most developed countries, the Third Sector has become an important economic and social institution, consisting of over 30,000 registered NGOs and employing about 10% of the Israel the workforce. Because public (government) financing is an important source of funding for the CSOs, corruption and misuse of public funds have often been practiced. In the early 1980s, the government launched a major bureaucratic and legal campaign to fight fraud and the unlawful distribution of public funds. The struggle for accountability continues and the government has gained some major achievements: 1) The Knesset and the Government adopted regulations that enhanced the coordination and cooperation among the donor agencies; 2) regulations were adopted to eliminate duplication in grants; 3) restrictions have been imposed on NGOs' overhead expenses and the distribution of

excessive benefits to NGO executives; and 4) the Proper Management Benchmark coerces the CSOs to submit annual activity reports, including financial reports of operations in progress, and completed operations. While the Israeli government maintains the autonomy and independence of its CS, major strides have been made in regulating the CS and in achieving accountability and proper management.

Israel: Peace and Conflict Resolution Organizations

Raviv Schwartz

Ben-Gurion, University of the Negev, Beer-Sheva, Israel

INTRODUCTION TO P/CROs: INTERNATIONAL PERSPECTIVE

In recent decades, we have witnessed the engagement of a host of international, national, and regional non-state actors seeking to resolve or at least contain the many forms of social, ethnic, religious, and political conflict. Most notable is the role played by non-governmental organizations (NGOs) in this effort, both domestically (e.g., peace movements) and internationally. Such NGO activity has also been evident in regions and countries experiencing protracted, violent conflict such as Israel/Palestine, Northern Ireland, South Africa, former Yugoslavia, etc. In societies subject to what Kreisberg terms *intractable conflict*, understood as “protracted, irreconcilable, violent, and self-perpetuating,”^[1] the identities distinguishing between the conflicted parties are ubiquitous and seemingly indelible and may eventually be “converted into something akin to ontological statuses.”^[2] It is therefore noteworthy that within these same societies, organizations [heretofore referred to as Peace/Conflict Resolution Organizations (P/CROs)] have emerged that reject or at least question the inevitability of both the conflicts and the contentious relations between the protagonists. In doing so, they often defy the prevailing sociopolitical climate in their respective societies.

HISTORICAL OVERVIEW OF ISRAELI CONTEXT

The Early Years

That P/CROs are expected to be active in the Israeli context is by no means a foregone conclusion, since issues of war and peace have traditionally been the sole purview of politicians and generals. In fact, during the first 25 years of Israel’s existence, peace activism was limited to the actions of particular individuals or small groups (rather than mass organizations), who had little effect on either public opinion or policy makers. However in recent decades, this monopoly has gradually eroded, with greater legitimacy afforded to other actors in the discourse around these issues. This shift is related to a more global trend of the reduced public confidence in state institutions.^[3] It is also a function of

the changes underway in Israel’s polity, according to which the public sector, which had initially been imbued with a strong collectivistic ethos, assumed a more open form, allowing for a more pluralistic model of relationships among its different groups and factions.^[4] This marked the transition during the late 1970s and early 1980s from what scholars of Israeli society term the Formative to the Pluralistic Era. It was during this period that the heterogeneous character of Israeli society began finding its expression in the institutional framework and the collectivist ideology gave way to a more individualistic one.^[5]

Another important factor in the loosening of the almost exclusive grip on the security discourse in the hands of the military and political elites was the enhanced sense of security following Israel’s victory in the Six Days War in 1967. The establishment of the nationalist Gush Emunim (Bloc of the Faithful) in the mid-1970s, a movement advocating the settling of Jews, in all the territories occupied by Israel since 1967 and of the dovish Peace Now in 1978 marked yet another milestone in the increased voice of citizens’ associations in the discourse on war and peace.^[6]

Throughout the 1980s, the primary mode of activity of Israeli P/CROs, of which Peace Now was the largest and most dominant, was that of protest—primarily in the form of large-scale demonstrations. From 1986, Israelis were prohibited by law from meeting with members/leaders of the PLO. Hence, dialogue and face-to-face encounters with “the other” was all but impossible—with the exception of encounters which invariably took place outside Israel/Palestine. The first *Intifada*, which commenced in December of 1987, only reinforced the disinclination to conduct any kind of face-to-face activity among Palestinians and Israelis, though a few dialogue initiatives did take place during the late 1980s, such as the “Rapprochement” group, but these were few and far between.^[7]

The Oslo Accords in 1993

In the years following the signing of the Oslo Accords (1993–2000), the dominant tactical form of Israeli P/CROs during the preceding years, i.e., protest, gave way to other modes of activity. The de-emphasizing of protest can be explained in part by the palpable sense on the part of many movement activists that the

government itself, led since 1992 by Labor, would take the lead in implementing the Oslo accords and bringing peace. Furthermore, with the thawing of relations between the Israeli and the Palestinian leadership, the stage was then set for much more extensive contact on a grassroots level between Israelis and Palestinians, referred to by many during this period as “people-to-people” activity. Not only were the macropolitical conditions ripe for the undertaking of such activity, funds from a variety of sources suddenly became available for projects along these lines. A host of private foundations, governments, international agencies, and others began allocating funds to Israeli P/CROs and other institutions that undertook a wide variety of projects grouped under the rubric of “people-to-people” activity. The rationale was that the formal peace agreements, embarked upon by the political elites from both sides, needed to be buttressed by civil society, i.e., the “bottom-up” support of citizens and institutions. During this same period, the Israeli peace movement underwent a process of institutionalization, according to which several P/CROs relied increasingly on professional staff rather than volunteers, assumed more complex organizational structures, and preoccupied themselves with the many administrative and programmatic obligations involved in the application for and receiving of funds and the concomitant financial reporting. This period was marked by the unmistakably enhanced role of foreign funders in the shape and scope of peace activism in Israel.

The 2nd Intifada—October 2000

The 2nd Intifada, which erupted in October 2000, resulted in a drastic reduction in the support among Israeli Jews for the already beleaguered peace process. During the period immediately after the outbreak of violence, demoralization among the ranks of Israel’s peace movement was palpable. The prevailing wisdom at the time, and reinforced through the media, was that the peace camp had been “shell-shocked”—paralyzed into a state of inaction. To be sure, the events that commenced in October 2000 were perceived by many in the field to have undermined the very possibility of peace and reconciliation. During this period then, P/CRO activity by and large ground to a halt and it was only after a year or so that some partial recuperation could be discerned. Those P/CROs that appeared less traumatized and debilitated by this crisis and its aftermath were those featuring a more radical ideological orientation, including some formed soon after the events of October 2000. Also evident during this period were (in most cases new) P/CROs that engaged in various activities designed to provide material assistance to and demonstrate solidarity with

Palestinians, as the collective predicament of the latter deteriorated considerably during this period. These include “Windows” and “Ta’ayush” to name just two.

DIVERSITY OF THE P/CRO COMMUNITY

One very salient feature of the environment of Israeli P/CROs is its diversity—both organizationally and ideologically. Attempts to classify the many types of P/CRO, for the purposes of analysis or for evaluation, have yielded a few typologies. One early effort arrived at the following three categories of P/CRO organizational forms: 1) service providers, which usually feature a specific service technology, serve clients/constituents, and often engage in capacity building in a variety of substantive areas (e.g., education and health); 2) “policy/development,” which typically enjoy a relatively high degree of access to decision makers, possess a particular expertise, interface regularly with negotiators, and often produce outputs such as position papers, etc.; 3) classic peace groups, a category of P/CROs that target ordinary citizens, policy makers, and the media through various public activities and seek to affect change at the level of mass consciousness.^[8] Another scheme developed classified P/CROs based on the nature of the activities conducted and arrived at three parallel categories: *peace building*, *peacemaking*, and *advocacy/protest*.^[9]

The variation in ideological orientations among Israeli P/CROs is also considerable. Until 1993, the dominant trend among P/CROs (particularly the larger more dominant ones) was consistent with the Zionist ethos; that is, they recognized Israel’s right to exist within secure borders as a state defining itself as “Jewish” and linked as such to the world Jewish community. These P/CROs have never adopted an explicitly antimilitarist or pacifist stance, as underscored by the fact that most peace activists serve in the Israeli army reserves.^[10] In recent years however, P/CROs that do not subscribe to Zionism, or may in fact oppose it altogether, have been established and are more visible. Ideological trends, such as anarchism and a blanket opposition to military conscription are presently an integral part of the landscape of P/CRO activity and have succeeded in mobilizing both the necessary material and human resources.

Another aspect of diversity finds expression in the social identity of membership/followers, whereby a number of P/CROs are organized around a particular identity marker or constituency. This phenomenon is mirrored in peace movements throughout the world, many of which also feature identity-specific mobilization.^[11–13] These include groups organized around religion (Orthodox Jews, clergy, ecumenical, etc.), gender (typically women’s groups, not all of which are

feminist in orientation), and professional background (physicians, social workers, retired military officers, and even planners). Yet another category which encompasses a few P/CROs is that which could best be described as “victim.” Included here are organizations formed by and for parents and family members of casualties of the conflict (i.e., terror victims and fallen soldiers). Interestingly, a P/CRO was established only recently composed not of victims of the conflict but of its perpetrators (i.e., Israelis and Palestinians who took part in violence as either soldiers or terrorists, respectively).

REGIONAL SIGNIFICANCE

For a variety of reasons, the phenomenon of P/CRO is not anywhere near as extensive in the Arab world as in Israel. Among the Palestinians as well, the bulk of politically oriented NGO activity focuses much more on the many grievances related to occupation and on the struggle for independence. Nevertheless, it is important to note that there are a number of P/CROs composed of both Israelis and Palestinians. In some cases, they are managed jointly and in others by two separate but parallel governance structures. A few of the P/CROs conforming to this pattern range from the large-scale initiatives of People’s Voice and Geneva to think-tanks such as Israel Palestine Center for Research and Information (IPCRI), to smaller groups with a more interpersonal, reconciliatory emphasis such as Parents’ Circle (bereaved parents) and Combatants for Peace.

CONCLUSION

There are many ways to attempt to gauge the impact of P/CROs. Firstly, looking at their aggregate effect, one must differentiate among the following targets: government policy; public opinion; and popular discourse. In a comprehensive study of Israeli P/CROs from 1967–1998, it was concluded that: “The aggregate efficacy of the Israeli peace movement seems to be quite low in terms of bringing about the desired political transformation in Israeli–Palestinian relations, e.g., the signing of a peace treaty. The efforts to introduce a dramatic change into Israeli public security also produced minor results.”^[14] These impressions are reinforced in a recent evaluation of peace-building projects undertaken primarily by P/CROs.^[9] One notable exception to the lack of P/CRO influence on policy is the experience of a single women’s protest group “Arba Imahot” (Four Mothers or Matriarchs). “Arba Imahot,” which advocated withdrawing Israeli troops from Lebanon. This P/CRO was deemed by many to have been very successful in both altering public opinion and prompting this desired change in policy. It

could be argued however that the success of this group could be traced to its narrow focus on a conflict that ultimately was not about either disputed territory or conflicting national narratives.

The impact of P/CROs does appear to have been more pronounced in the evolving discourse on matters of peace, security, and relations between Israelis and Palestinians. In addition, a strong case can be made for their having successfully challenged the prevailing view of the conflict as inevitable.^[14] Accordingly, the impact of P/CROs on policy can, at best, be conceived of as indirect. Ultimately, it would seem their most significant contribution is in the cultural, symbolic realm. However, in as much as the forces in this realm are brought to bear on public opinion and on government policy, they may be considered efficacious.

The impact of P/CRO activity may also be gauged at the level of those touched by it, i.e., participants in the many activities/projects undertaken. It must be noted that many of the efforts to formally and/or informally evaluate the impact of P/CRO activity are intended primarily for the consumption of those bodies funding the activity. These funders are typically drawn to activities that feature large numbers of participants and offer some opportunity for a larger visibility or “ripple effect”, rather than focusing on the potentially transformative nature of certain P/CRO activities at the microlevel of individual participation.^[15] What is very important to point out is that even during the zenith of P/CRO activity in Israel (1993–2000), the numbers of individuals touched by this enterprise was still quite small. It is difficult to gauge in numbers, but it is reasonable to assume that the percentage of the Israeli population touched directly or indirectly by the P/CRO enterprise never exceeded 10%.

Some have argued that the eruption of violence in 2000, at a time when P/CRO activity was at a height is effectively a confirmation of its lack of efficacy. The pacification of the peace movement during most of the first-half of the 1990s, i.e., their preference for reconciliation, dialogues, and joint projects at the expense of massive peace protest, rendered it ill-equipped to react when the peace process ground to a halt.^[10] Others claim that even if such activity proved unable to buttress a beleaguered peace process, it did nevertheless succeed in keeping open some lines of communication between parties who were transformed almost overnight from partners in a peace process to inveterate enemies in a seemingly timeless violent conflict.^[15]

Israel: Public Law

Assaf Meydani

*School of Government and Society, The Academic College of Tel-Aviv Yaffo,
Tel-Aviv, Israel*

INTRODUCTION

Public law in Israel reflects the collection of norms that govern the legal relationships between the state and the individuals, and the relations among governmental agencies. Public law covers constitutional law and administrative law. It also incorporates socio-political aspects that infuse it with positive and normative content and play a role in shaping it. The main issues governed by public law include the protection of human rights, the regulation of administrative authorities, and the oversight and monitoring of how administrative authority is used, as well as the formal and material definition of constitutional norms, the legal status of government agencies, and the administrative process. Constitutional law is the body of law that governs the legal status of the basic norms in the Israeli legal system and defines the interrelationships and powers of government agencies and other state entities. The constitutional mechanism is designed around legal norms, each of which has a different normative status. A formal constitution is generally at the top of this pyramid. Unlike countries such as the United States and Canada that have coherent constitutional documents, Israel does not have a formal constitution. However, over the years, a system of basic laws has been enacted, which are designed to address specific constitutional issues. At some point in the future, they may be compiled into a complete constitutional document. The statutes that constitute the legislation entitled Basic Law: Human Dignity and Liberty, passed in 1995, are recognized as having constitutional status that takes precedence over regular law in Israeli judicial interpretation.^[1] The recognition of the basic laws as having constitutional status was dubbed the “constitutional revolution.”^[2] Thus, Israel now has constitutional norms that override normal statutes and provide the legal basis according to which the Supreme Court interprets Israeli legal provisions and conducts judicial review of primary legislation. The basic laws that have had the most significant impact are Basic Law: Human Dignity and Liberty and Basic Law: Freedom of Occupation.

ISRAELI CONSTITUTIONAL HISTORY

According to United Nations General Assembly Resolution 181 of November 29, 1947, Israel was to have its Constituent Assembly adopt a constitution. There has been significant legal debate about whether this resolution is still binding on Israel. Indeed, at the beginning of 1949, a Constituent Assembly was elected. However, the Assembly’s decision was not to ratify a constitution, but instead to become the legislative body, and gradually enact basic laws, which together would form the sections of a constitution at some point in the future. This endeavor has still not been completed. To date, the Knesset has passed 11 basic laws. Five basic laws define the activity of government agencies—Basic Law: The President of the State, Basic Law: The Knesset (amended twice), Basic Law: The Judiciary, and Basic Law: The State Comptroller. Three basic laws define national institutions and assets—Basic Law: Israel Lands, Basic Law: The State Economy, and Basic Law: The Army. One basic law defines the status of Jerusalem as the capital of Israel. Two basic laws—Basic Law: Freedom of Occupation (amended once) and Basic Law: Human Dignity and Liberty—define fundamental human rights and are at the heart of all other legislation. These basic laws assert that their purpose is to establish in law the values of the State of Israel as a Jewish and democratic state. By virtue of this act, those very values of the State of Israel as a Jewish and democratic state became the object of judicial interpretation. Moreover, both of these basic laws restrict the authority of the Knesset to legislate laws that violate the basic rights that they serve to protect. If a law that infringes on these rights is found to have a worthy purpose and is proportional in its infringement, it is deemed constitutional and does not violate the basic law.

Judicial Review of the Constitutionality of Laws: “The Constitutional Revolution”

Judicial review of the constitutionality of primary legislation was not explicitly defined in the basic laws,

and has developed in Israel on the basis of the Supreme Court's interpretation of the constitutional documents. It is through this process that rights such as the freedom of expression, the freedom of election, and the freedom of protest have been established.^[3] In the 1970s and 1980s, the Supreme Court began adopting a strategy of increased intervention in the activities of other government agencies in areas where it had heretofore not inserted itself.^[4] At the procedural level, the High Court of Justice began to accept cases without rigorous investigation of the doctrines of "standing" and "justiciability," which in the past had been the cornerstones in determining the Court's willingness to hear appeals.^[5] At the material-content level, in the 1980s and 1990s, the Supreme Court significantly expanded its level of intervention in the activities of administrative agencies. Thus, it ruled that the exemption from military service granted to yeshiva students was not legal. It disqualified interrogation methods used by the General Security Service and, through its intervention, allowed women to be inducted into the Air Force pilot training course. This intervention drew no small amount of criticism from the legal community and members of the public alike. The expression widely used in public and legal discourse to describe these developments is "activism." Among other things, these developments are the result of deep fissures in Israeli society, along with an institutional structure that creates a situation in which the political system finds it very difficult to cope with problems that require the formulation of public policy. The functional failures of the legislative and parliamentary branch lead to an increasing number of appeals to the judiciary branch.^[6]

The very fact that the Court has the authority to strike down laws is seen by some as dealing a blow to the supremacy of the legislative branch, despite the Knesset's ability to overrule the Court through legislation. However, since the legislation of Basic Law: Human Dignity and Liberty (1992) and Basic Law: Freedom of Occupation (1992), the Supreme Court has invalidated sections of no more than five laws.

Separation of Powers

A fundamental element of the Israeli system of government is the principle of the separation of powers. Over the years, Israel has undergone a change in terms of how the state is perceived by the Court, moving from a pure separation of powers to a model of checks and balances. In the latter model, the Supreme Court recognized its political power and understood that its legitimacy as a partner in collective social decisions in the State of Israel required it to play a number of roles including interventional monitoring of the affairs of other agencies. In this regard, the Court

was required to intervene in matters that deviated from the traditional pattern of separation of powers, for example, stripping Knesset members of their immunity, overseeing regulations, reviewing political agreements, validating political appointments, and allowing government ministers with indictments pending against them to retain their positions.^[7]

The Israeli Judicial Branch

The judicial branch in Israel has the status of first among equals relative to the other branches of government. Thus, for example, it enjoys a substantial degree of independence from political influence. Judges in the Supreme Court are appointed by the Judicial Selection Committee, composed of representatives of all three branches of government, ensuring a professional and apolitical selection process.^[8]

The Israeli Supreme Court serves a wide variety of functions. First of all, it is the highest court of appeals in the Israeli legal system. Furthermore, it is the first venue in which disputes between the individuals and the State are heard. This second role has caused the Supreme Court to be viewed by the general public as the watchdog over the rule of law and the champion in the fight against corruption and the protection of human and civil rights. To reduce the heavy burden of fulfilling this role, a reform has been enacted in which cases brought by individuals against the state will now be heard first by lower courts.

A JEWISH AND DEMOCRATIC STATE

The Israeli public has been grappling with the issue of the Jewish character of Israel as a Jewish and democratic state since the founding of the state. The State of Israel's unique character, as well as the history preceding its establishment, testifies to the explicit desire of its founders to establish a Jewish nation with a Jewish character and to make the State of Israel the homeland of the Jewish people. This desire is reflected in the selection of Hebrew as the official language of the country, the recognition of the Jewish holidays and Jewish symbols as the official national symbols, and the establishment of religious services and immigration legislation that show a decisive preference for Jews.^[9] That said, no law has been passed stipulating who is a Jew, and the formal definition recognizes a Jew as an individual who is born to a Jewish mother or an individual who has converted. It does not specifically define the type of conversion, whether in accordance with Jewish law, nor does it state whether conversion is possible when conducted under auspices that are not Orthodox. While Israel is the national

homeland of the Jewish people, it does not exclude others from becoming citizens; it is, under its laws and founding principles and despite the hostility, war and terror to which it is subject, a state that is a land of equal opportunity for all of its Arab citizens. Thus, for example, the Court has ordered that the writing on street signs must also appear in Arabic and ruled that Arabs and Jews should be treated equally when purchasing residential property.^[10]

Administrative Law

In addition to the provisions of constitutional law, public law also encompasses the provisions of administrative law. This legal field regulates the activities of all governmental administrative agencies. Administrative law deals with the structure of the administration and its authorities, the proper conduct of the administrative process, the amount of discretion the authority is allowed, the oversight of the administrative agency, and the degree of freedom of activity the administrative agency has under private law. At the heart of administrative law is the concept that public administration functions as a public trustee and therefore is expected to behave according to higher standards than those applicable to players under private law.^[11]

THE RULE OF LAW AND PRINCIPLE OF LEGALITY: CONCLUSION

The administrative authorities in Israel generally have a decentralized, hierarchical structure. Thus, for example, there are central administrative authorities (such as the Ministry of the Interior) that have offices around the country (local authorities). Similarly, the different administrative jurisdictions embody various types of authority, among them, quasi-judicial, legislative, and executive authorities. The guideline directing the activity of administrative agencies in Israel is the principle of legality. The principle stipulates that, as opposed to a private individual who is allowed to do anything that is not explicitly prohibited, administrative agencies begin at a higher standard. Implementation of the principle of legality with respect to the administrative agencies assumes that everything that is not explicitly allowed is prohibited. In other words, the activity of the administrative agency must be stipulated explicitly in the law. Furthermore, administrative agencies are subject to the doctrine of natural justice,^[12] which requires fair proceedings in disputes with citizens, including providing a party injured by their action with the right to be heard and to

have his or her case reviewed. Administrative agencies are also subject to the test of reason and proportionality stemming from the constitutional philosophy in Israel.^[13] Thus, the administrative agency must determine clear, general standards for legislation, and is prohibited from enacting legislation that is supposed to apply to an undefined group of people. In addition, the agency must regulate itself internally and create stable legal norms and decisions that must be published and applied from the point of their enactment.

Israel: Spatial Policy

Arie Hershcovich

Department of Political Science, Yezreel Valley College, Emek Yezreel, Israel

INTRODUCTION

One might expect that in a densely populated country, with a high birthrate and a commitment to accept Jewish immigration, spatial policy will be very high on the political agenda. In fact until lately it was shaped within rather closed group of professionals working for governmental institutions, quazi-governmental organizations, interest groups, and the business sector. Those professionals shared a common commitment to the Zionist ideology. That commitment enabled them to pursue common goals, although given only vague directions from the government, which is officially the highest planning authority.^[1,2]

The spatial policy formation system in Israel can be divided into three parts: regulatory, initiatory, and inhibitory. The regulatory part employs zoning—the definition of land use as its main tool. The zones are determined by outline plans, according to the Planning and Building Law 1965. An initiatory system operates alongside the regulatory part. Until the 1990's, it was comprised primarily of “institutional entrepreneurs,” among them government ministries, the Jewish Agency, the Israel Land Administration, and local authorities. The inhibitory part advocates conservation and environmental considerations. It too was comprised mostly by governmental and quasi-governmental organizations. All three parts shared a common commitment to the Zionist ideology, which led to a spatial policy that was intended mainly to disperse the Jewish population of Israel, as a means of confirming the states control of the space.^[2,3] More recently, the balance of the initiatory system shifted toward the private sector, while the inhibitory side has been joined by organizations working to safeguard the territorial rights of the Arabs in Israel, to preserve cultural and historical values, and promote ecological considerations. The rise of these groups along with the decline of the Jewish Agency and less government interventions are manifested in a change of paradigm in the Israeli spatial policy, from population dispersal to a more concentrated, compact, efficient, and environmental friendly policy (Fig. 1).^[4]

THE INSTITUTIONS

Most of the institutions involved with shaping the spatial policy in Israel are part of or affiliated to the

Ministry of the Interior, thus creating a rather closed and elitist system of policy formation. In most cases their constitution and authority are defined by Planning and Building Law 1965, which replaced the British Mandate's Town and Country Planning Act 1936. At the top of the pyramid is the *Government of Israel*, which is authorized to approve national outline plans.

Israel Land Administration

The Israel Land Administration (ILA) was established in 1960 by a special law. It is responsible for managing the “Nation's Land,” which comprise about 93% of the land in Israel (about 15% of it belongs to the National Jewish Fund and the rest to the state of Israel). According to law, the “Nation's Land” cannot be sold to anybody but the state of Israel. It can be only leased through the ILA. Therefore, the ILA has almost complete control over the location, the amount and the price of land available for development.^[6,7] Having a disproportionate representation of the rural sector on its board, the ILA policy is traditionally biased toward the periphery and the agricultural sector. Lately, the ILA started a careful process of privatization by granting full ownership to some of the leaseholders.

The National Planning and Building Council

The National Planning and Building Council prepare national outline plans for government approval. It also approves regional outline plans, advises the government regarding national planning policy, and rules on appeals at the regional and local levels. The Council is chaired by the Minister of the Interior and has 32 members: one-third is government representatives, one-third represent local authorities, and one-third is professionals and representatives of interest groups (Sections 2–6).^[8,9] The National Council's major areas of operations include population dispersal, establishment and expansion of settlements, and planning of national-level infrastructure. Because these areas involve the interests of numerous parties,^[2] the planning process is “lively and competitive... a political process that determines policy results.”^[10]

Fig. 1 The Israeli planning system. [From Ref.^[5] (this chart is an updated version of the source).]

The Regional Planning and Building Commission

Israel has six regional planning and building commissions: Northern, Haifa, Tel Aviv, Central, Jerusalem, and Southern. These commissions prepare the regional outline plans and submit them to the National Council for approval.

The Local Planning and Building Commission

The local planning and building commissions are responsible for preparing and publicizing local outline plans, hearing objections, and approving plans. Nevertheless, in most cases a plan still requires the approval of the regional commission. The local commissions issue building permits, collect improvement levies (levies imposed on increases to land value due to planning), and pay compensation for decreases to land value due to planning (Sections 2–6).^[8,9]

The Agricultural Lands and Open Spaces Conservation Commission

All the land in Israel was declared agricultural by default. The Agricultural Lands Conservation Commission alone has the authority to convert the status of land so it can be built on (First Amendment, Section 156B).^[8,9,11]

The Coastal Water Commission

This commission is authorized to approve any plan related to Israel's coastal waters (the 12-mile wide strip of water adjacent to the coast) (Second Amendment, Section 156B).^[8,9,11]

The National Infrastructures Commission

The National Infrastructures Commission was established in 2002 in order to expedite the planning process of national infrastructure. It has all the authorities and responsibilities of the National Council with respect to national infrastructures. A project is defined as a national infrastructure project by a committee of ministers. Such definition makes the project exempt from the regular planning process.^[8,12]

The Planning Administration of the Ministry of the Interior

The Planning Administration is the executive branch of the Minister of the Interior in his capacity as supervisor of the Planning and Building Law 1965. The administration's major functions involve: 1) formulating the national spatial planning policy and 2) professionally advising and running the planning institutions on all levels. According to the law every local outline plan has to be submitted to the Minister of the Interior, which is to the Planning Administration, for inspection.^[8,12]

The government of Israel is able, through these institutions, to control both the land supply and its use. This gives it a formidable capability of forming and implementing spatial policy, which is expressed mainly by the spatial plans.

THE PLANS

In accordance with Section 145 of the Planning and Building Law 1965, every action involving land requires a permit. Such a permit will be granted if the action corresponds with all the outline plans applicable to that land area. Therefore, the outline plans are the most effective means of spatial policy. These plans are ranked hierarchically, from detailed plans through local, regional, and national plans. A plan delimits a given land area within an outline (The Blue Line) and defines the land uses within this area. This action is known as *zoning—defining land uses*. The plan is comprised of a map (or “drawing” as set out in the law, Section 83) and regulations. The drawing must show the land uses, for example residential, commercial, roads, public buildings, open public areas, etc.

The regulations include directives for the various uses and quantity allocations.^[9]

Local Outline Plan^a

The local outline plan's directives are physical only, and concern land usage, road demarcation, spaces, density, etc. (Sections 61–69).^[8,9] The preparation of a local outline plan can involve disputes with many citizens who object to the plan for a variety of reasons. Hence, in most places in Israel the local outline plans are very old, and many do not have outline plans at all. The local commissions cope with this problem in two ways: 1) through partial outline plans, which enables the commission to deal with a smaller number of objections, though their ability to take overall issues into consideration is damaged and 2) By means of “shadow plans,” i.e., master plans (with no legal status) that the commission relates to as if they had validity in order to approve building plans. Because such plans are not official outline plans, they are not publicized in order for people to be able to submit their objections.

Regional Outline Plan

The purpose of the regional outline plan is to set out the requirements for implementing the national outline plan within the region. While the local outline plan relates only to the physical conditions, the regional plan also takes into consideration the “proper conditions for security and employment” (Section 55).^[9]

National Outline Plan

According to the Town and Country Planning Act 1936, there were only local outline plans. The Planning and Building Law 1965 specified also national outline plan (NOP) and regional outline plan for a number of reasons: 1) the small space of Israel, requiring optimization of use; 2) strong competition over land and space; 3) a great deal of government intervention in social and economic areas; and 4) significant emphasis on national considerations.^[10,11,13]

Most of the national plans are geared to a particular topic or area, such as roads, the Ben-Gurion airport, cemeteries, beaches, etc. Three of the plans are comprehensive plans: NOP #6 for Geographic Distribution of the Population (TAMA 6); NOP #31 for Construction,

Development, and Immigrant Absorption, (TAMA 31); and NOP #35 (TAMA 35), which replaced TAMA 31.^[8]

Plan Preparation and Approval

Local outline plans can be prepared by any party, whether private or public and then submitted to the local or regional commission. Regional plans are prepared by the regional planning commission. After a local or regional outline plan is prepared it is publicized in order to enable the public to examine it and submit objections. Preparation of a national plan is initiated by the National Planning and Building Council. The approval of a plan will be next higher institute. NOPs have to be approved by the government of Israel (Sections 77–119).^[8,9]

NATIONAL-LEVEL SPATIAL POLICY

Physical Planning for Israel (The Sharon Plan) 1951

Though not sanctioned by law, “The Sharon Plan” to a large extent has shaped Israel's spatial character. The goals of this plan included establishing a Jewish presence in all areas of the State of Israel and accelerated development.^[14,15] At the core of the Sharon Plan are “The New Towns,” which were built in the periphery for the large number of Jewish immigrants. “The Sharon Plan” was implemented almost in its entirety, at a tremendous cost. The price was paid by the immigrants who were distanced from the countries economic and social centers, and the Arabs whose settlements were destroyed in order to make place for the new towns.^[2,16]

NOP #6 for Geographic Dispersal of the Population (TAMA 6) 1974

TAMA 6 objective were defined as follows: “balanced distribution of the population and increased efforts in populating the Galilee, the Negev, and the other sparsely populated areas of the country, while increasing the Jewish population of these regions in order to preserve the current population ratio between the Jewish population and the minority [Arabs] population in the Galilee region” (on pages 50–51 of Ref.^[17]).

NOP #31 for Construction, Development, and Immigrant Absorption (TAMA 31) 1991

While the official policy is still one of population dispersal, TAMA 31 notes the contradiction between

^aLocal outline plan is sometimes referred to as a city building plan, as set out in the Town and Country Planning Act 1936, which preceded the Planning and Building Law 1965.

the desire to distribute the population and the need to find employment for the large number of immigrants expected to arrive at the beginning of the 1990s, because most jobs were located primarily at the center of the country. Accordingly, it proposes concentrating development in three metropolitan regions: north (Haifa), center (greater Tel-Aviv and Jerusalem), and south (Beer Sheva).^[18] TAMA 31 also presents a new attitude toward the Arab population. While the previous plans ignored the Arabs or saw them as a barrier to achieving their demographic goals, TAMA 31 includes among its objectives “ensuring conditions for equal development of the Arab population of the State of Israel”(on page 2.2 of Ref.^[18]).

Israel 2020—Master Plan for Israel for the 21st Century 1996

Israel 2020 plan has no legal status, but it has had an impact on planning perceptions in Israel. Its major recommendation is to adopt a policy of *centralized dispersal* according to which the population will be concentrated in three multifocal metropolitan areas (urbanized spaces) in the north, the center, and the south of the country. Israel 2020 plan designates three strategic spatial goals: 1) Efficient land exploitation: because Israel is a crowded country with a high natural rate of increase. 2) Enhance economic development: generating benefits of size (agglomeration) through transportation and communication infrastructures. 3) Adapting to peace: the social and economic gaps between Israel and the Arab countries necessitate developing the border areas in order to maximize the benefits for both parties and minimize the danger of antagonism.^[19]

NOP #35 Erez (Land) (TAMA 35) 2005

TAMA 35 is called “Land” against the background of the three planning dimensions in “The Sharon Plan”: land, people, and time. Nevertheless, its basic assumptions, its goals, and the means it employs are totally different from those in “The Sharon Plan.” It asserts that in order to be able to supply the amount of built and open spaces suitable for a developed country, land in Israel must be used more efficiently. Therefore, TAMA 35 recommends “to consolidate the urbanized areas into four^b metropolitan areas and to emphasize the principle of a continuum of open areas” and “to limit suburbanization.”

^bWhile TAMA 31 and 2020 plan count Tel-Aviv and Jerusalem as one metropolitan area, TAMA 35 counts them separately.

TAMA 35 introduces the “language of textures.” A “texture” refers to an area defined in the plan in which a particular type of development is permitted, ranging from urban texture (where major development efforts will be directed. Urban development will be compact . . .) to combined-reserved development (with the goal of creating a continuum of natural resources, landscape, settlement, and tradition . . .). In total, there are six such textures.^[20]

THE USE OF SPATIAL POLICY TO ACHIEVE NATIONAL GOALS

The spatial policy is perceived by the Israeli governments as a central means of promoting national goals.^[21] Until the 1990s, reassuring the control of the land by the Jewish majority was given first priority and was seen as part of the national security policy. Human rights, social fairness, economic development, and environmental considerations were subordinated to it. The association with security matters and the potential contradiction with human rights led to an elitist pattern of policy formation, with minimal public participation. This resulted in an unbalanced allocation of spatial resources. Those who have benefited were mainly the veteran Israelis (the founders), at the expense of the new immigrants, mostly Jews from the Arab countries, who were relegated to the peripheral areas, and of the Israeli Arabs (the indigenous natives), whose towns were destroyed and whose lands were expropriated.^[2,21,22] Recently, a gradual change can be detected, and more attempts are being made to involve the public in the policy formation process.^[2,4]

CONCLUSION—A NEW SPATIAL POLICY FOR ISRAEL

The 2020 Master Plan and the TAMA 35 Plan mark the inauguration of a new spatial policy for Israel. National security considerations are being gradually replaced by environmental considerations and an awareness to different needs determined by gender, ethnic group, socioeconomic status, and life style.^[23,24] In these aspects the spatial policy in Israel is following trends observed in other countries. In fact, the central role of the professional elite in shaping the Israeli spatial policy makes it more susceptible to policy transfer and diffusion in the global era.^[22–26]

Job Classification

Lyn Holley

Department of Gerontology, University of Nebraska at Omaha, Omaha, Nebraska, U.S.A.

INTRODUCTION

This article begins with a summary description of job classification, then situates job classification within a context of organizing to accomplish work, and discusses the management functions supported by job classification and the roles in classification played by executives, managers, and job classifiers. It discusses “scientific classification,” the impact of different frames of reference (i.e., different employers and different criterion measures) on classification, and describes various job classification techniques. It examines the dual role of job classification as a vehicle for both management and public accountability. Finally, it concludes that job classification codes are vital information for management of work in a wide range of circumstances from stabilizing the civil services of African and Central American nations to maintaining accountability of the “new” public management workforce.

DEFINITION

Job classification is the process of assigning codes to jobs. The code of a particular job represents the type and level of work assigned. Its classification code locates the work of a job in relation to the work of the other jobs within a defined frame of reference. Jobs that are considered to be equivalent in type or level of work assigned have the same classification code. The classification code of a job links the job to a pay range, qualifications needed to do the job, and many administrative requirements and laws.

One example of a classification code is “Counseling Psychologist, (General Schedule) GS-0180-13.” In the U.S. federal government frame of reference, many jobs have this classification code. Jobs with the same classification code are considered equivalent in respect to the type and level of work assigned to the job. Jobs with the same code have the same minimum qualification requirements and are in the same pay range.

Different levels of work have different codes. For example, the job classification code, “Counseling Psychologist, GS-0180-09” indicates a job at a lower level of work than “Counseling Psychologist, GS-0180-13.” A job at level “09” has a lower pay range than a job at

level “13.” A level of work, such as level “09” or level “13,” may cut across many different occupations. For example, the “Counseling Psychologist, GS-0180-13” code is different from the “Information Technology Specialist (Systems Administration), GS-2210-13” code, even though “13” indicates the same level of work in both occupations.

Job classification is used in the United States by the federal government, all state governments, and virtually all local governments.^[1] Large- and medium-size private organizations use job classification. Different employers use different classification systems. The same employer may use different job classification systems for different groups of jobs; for example, a different system may be used for blue-collar (trades) jobs than for white-collar (professional and managerial) jobs.

Government job classification systems tend to be more detailed than private sector job classification systems. Many types or levels of government work have no effective counterpart in the private sector—public rule making and law enforcement are two examples. Pay for these jobs cannot be compared directly with pay in the private sector labor market. Setting pay levels for these jobs in relation to the private sector labor market is achieved by establishing the relationship of jobs that have no private sector counterpart to other jobs in government that do have private sector counterparts.

Despite its widespread application, job classification is not widely understood. Most managers and employees are aware of job classification only as a seemingly arbitrary limitation on pay or staffing flexibility.

ORGANIZING WORK

Job classification is critical to organizing work on a large scale. To plan, coordinate, or direct work, it is necessary to have some way to estimate and track the type and amount of human resources needed to produce the desired results. Public officials or contractors who manage people need to identify the knowledge, skills, and abilities required to produce desired results, recognize persons who have those attributes, and communicate the type of work and pay of each job.

Job classification is critical to demonstrating fairness. The realities of the relevant labor market, law,

and employees' perceptions all pressure managers to pay individual employees appropriately in relation to other employees. Job classification codes permit comparison of pay for similar types and levels of work.

Job classification is a key element in public accountability. Agency heads and legislators or boards are expected to ensure that amounts paid to individuals for work are justified and defensible. Job classification codes are fundamental to recording and comparing the amounts paid for similar types and levels of work by different organization units.

Job classification systems consist of classification codes and rules for how to match work and jobs with classification codes. Classification rules govern how jobs are sorted by type of work (e.g., as secretary or nurse) and level of work (e.g., as trainee, journeyman, or expert). The codes label each type of work and level of work. Different job classification systems have different sets of rules and codes.

One of the results of applying a job classification system is an outline of the work of an organization. The traditional organization chart shows job titles and numbers of workers for each title in each organization unit. Job classification is necessary to assign titles to jobs systematically, so that jobs with the same job titles are actually similar. Job titles allow organizations to interface in a general way with the labor market. The U.S. government supports economic development, record keeping, and workforce research by providing systems of standard job titles and occupational codes for hundreds of different types of work.^a

Job titles are one level of job classification "code." The more precise the "coding" of work into types and levels, the more comprehensive the information on the organization chart about each job. For example, the classification code "Counseling Psychologist, GS-0180-13" includes much information in addition to the job title. It links all the jobs with that code to pay tables and directives about pay, in this case, to pay range 13 in the GS. The classification code also links the job to specific classification standards. The classification standards include information about the nature of the Counseling Psychologist occupation (code 0180), and explain how jobs are classified in the 0180 occupation at the 13 level. The classification code links the job to standards, studies, and directives

about qualifications needed to carry out the work, and to specific procedures for hiring or selecting people to fill the job. The classification code also links the job to laws, regulations, or handbooks outlining other administrative requirements, such as eligibility of the incumbent of the job for various types of overtime or for inclusion in the union bargaining unit. Finally, the classification code links the job to employer and employee records of work, and records of staffing or other personnel decisions.

Job classification is not needed in very small organizations where the mission statement is often adequate for communicating about work. Division of work within the organization (e.g., a team of research scientists, a family farm) can be fluid and informal. The "job" of each person in the organization can emerge from the requirements of each new day. However, if the family farmers seek to hire an equipment operator, they will have to define a "job" to interface with the labor market, locate people with the skills needed, identify appropriate pay, and communicate with applicants about duties to be assigned and work expected.

Larger organizations have more interchange with the external labor market. In larger organizations, relationships are more contractual than familial, and require more formal record keeping. In larger organizations, different laws and regulations apply. Larger organizations are characterized by division and specialization of labor, and require some means for summarizing and combining information about many jobs. Job classification meets these and other needs of larger organizations.

FUNCTIONS SUPPORTED BY JOB CLASSIFICATION

Job classification is a function of the management of work carried out by people. Job classification facilitates movement of people to and among jobs. As it is used in the United States, job classification helps employers to find people and people to find employers on the basis of the work of the job, rather than on another basis such as kinship, ethnicity, or propinquity. Each paragraph in this section describes a management function to which job classification is fundamental.

Estimating, Tracking, and Fulfilling Human Resources Requirements

The concept of "job" is the basis for estimating human resources costs and requirements. "Job" is a unit of analysis for work; It is used to estimate how many of what kind of people are needed to achieve desired

^aThe Standard Occupational Classification System (SOC) classifies occupations on the basis of work performed and required skills, education, and training or credentials. Each occupation is assigned to only one group at the lowest level of the occupation. The SOC issued in Fall 1998 blends previous industry- or work-based classification systems (e.g., the Standard Industrial Classification System) with previous skills and worker attributes-based systems (e.g., the Dictionary of Occupational Titles).

results and to specify how many of what kind of people should be hired or let go. A “job” exists apart from its incumbent.

Identifying the type and level of work in a job is essential to accessing a work-based internal or external labor market. Job titles and further classification codes for type and level of work link the work of the job to qualifications required, and suggest the type and level of work assigned. Job descriptions communicate the work of the job in more detail.

Managing and Planning Work

Distribution of work is guided by job classification. Job descriptions record decisions made about the typical flow of work in an organization, and the typical work of each employee. Supervisors assign and employees accept work within this framework of prior agreement. At higher management levels, classification codes guide assignment of additional or new work (e.g., programs and projects). Classification codes identify the location and number of jobs with qualifications relevant to the new or additional work [e.g., Information Technology Specialists (Systems Analyst)]. The U.S. federal government can access this information for the million or so jobs covered by its central classification system.

Comparing Pay

The concept of “job” is fundamental to most methods for comparing pay. Comparing one person’s pay with another person’s pay has little meaning in the labor market or in court, unless both persons are doing substantially similar work. Work is usually considered “substantially similar” if both persons incumbent jobs with the same classification codes.

Appraising Performance

To appraise the performance of individual employees or to set standards for performance, it is necessary to establish a basis for comparison. Where work performance is the basis for comparison, job classification identifies which types of work are comparable. Comparing the work performance of a secretary with the work performance of an electrical engineer is as inappropriate as comparing circles with squares. Although both a secretary and an electrical engineer might have the same performance rating (e.g., “acceptable”), deciding in each case whether the incumbent has met acceptable work standards requires comparison with work standards that are appropriate for the occupation.

Comparing Unit Performance

Comparing performance of organization units requires a way to represent the types of work performed by the units and levels of resources available in the units. If Unit E carries out engineering aspects of environmental cleanup and Unit L carries out legal aspects of environmental cleanup, direct comparison of their work performance is not appropriate.

In cases where Unit E and Unit L each has a rating that refers to its own performance (e.g., a rating of “met plan”), each unit performance rating has little meaning without comparison to other, similar units. Once similar units are identified, comparison further requires some way to take into account the differences in resources available to each unit. For example, Unit E and Unit E2 both may be engaged in engineering aspects of environmental cleanup. Comparison of these units requires some consideration of resources available in each unit. It may be that Unit E has operated with 50% of its engineer positions vacant, whereas Unit E2 has had no vacancies. It may be that Unit E has had only one supervisor or senior worker for every eight engineers, whereas Unit E2 has had three. It may be that Unit E has 30% of its engineer positions filled at the trainee level, whereas Unit E2 engineers all are at full proficiency. Job classification provides the codes necessary to identify similar units, and within units, to sort out types and levels of resources (jobs) required and available.

Job classification codes outline particular configurations of resources and types of work, and support comparison and evaluation of unit performance.

Identifying Incumbent Rights and Entitlements

The classification of each job links the job with laws, regulations, agency guidance, and precedents that determine the eligibility of its incumbent for Fair Labor Standards Act of 1938 overtime; inclusion in a union bargaining unit, merit pay pools, and particular retirement, health, or paid leave benefits.

Keeping Records of Work and Employment

Job classification codes link records of hiring, paying, and appraising employees and connect the records to laws, regulations, and guidance in effect at specific times.

To fully consider the impact of changing a job classification system, executives and experts need to consider all the ways in which job classification supports management.

EXECUTIVES, MANAGERS, AND JOB CLASSIFICATION PROFESSIONALS

Classification is fundamental to management decisions about what type of people to hire, how much to pay them, which employees are eligible for union membership, how to distribute rewards, and how to report and explain staffing and pay to company executives, regulators, and the courts.

Private sector executives supported by classification experts select job classification techniques, the criterion for the relationships among jobs, and the coverage of job classification used by their organization. Executives use the information provided by job classification to control costs, account for expenditures, plan work, and allocate resources. In the public sector, the legislature makes most of these executive decisions.

Many public sector executives and many managers in both sectors are aware of job classification only as a restraint that limits whom they can hire and how much they can pay. Job classification professionals are the messengers who bring to managers the “bad news” about controls imposed at executive levels. The tension between the responsibilities of job classification professionals and managers sometimes generates an adversary relationship.

Job classification professionals are experts in applying the rules of the job classification system used by their employer. Job classification professionals must often certify the technical accuracy of job classification decisions before personnel actions can be implemented. Making an exception to the system for one manager almost inevitably evolves into an “exception” for all managers. In the federal system and several others, the job classification professional is bound by the ethical implications of classification rules that have a basis in law.

Job classification professionals typically classify jobs in many different occupations. Developing the ability to gather and understand enough information about a particular job, to classify it accurately in the time available to do so requires years of training and experience.

In recent years, the process of job classification has been somewhat simplified by a trend toward using less specific classification codes, and more generic job descriptions. The job classification process has been facilitated by the spectacular enhancement of access to classification resources such as standards, examples of job descriptions, and related information through use of the World Wide Web. Some government agencies have delegated responsibility to managers for classifying their own subordinate positions. In those circumstances, the role of job classification professional becomes one of providing expert advice and training, updating electronic resources, or auditing decisions made by managers.

SCIENTIFIC CLASSIFICATION

Classification is a necessary step in dealing with large amounts of information of all kinds. Ancient Egyptians classified, recorded, and analyzed the behaviors of the Nile River to interface more effectively with nature. Family farms classify income and expenses to more effectively interface with lenders or tax collectors. Modern organizations classify work to interface with external labor markets, as well as coordinate management of their internal workforces.

In the early 1900s, progressive reformers in the United States sought to address government corruption by instituting a merit system for some government jobs. Duties and responsibilities of each job covered by a merit system are typically specified and recorded in a job description. Qualifications required to do the work are specified, and selection of personnel is based on qualifications required to do the work. Pay is set in relation to the work of the job. Job classification is necessary to compare pay for a job with the pay for similar jobs in the labor market, and to compare pay of one job with pay of another job in the same organization. The Classification Act of 1923 established a classification system in the federal government, which has been modified and expanded by successor Acts, and now applies to about 1 million federal jobs.

Achievements of the physical sciences have generated much enthusiasm for scientific methods. Job classification methods echo methods of the physical sciences and, by virtue of establishing systematic procedures for gathering and analyzing information about jobs, have been called “scientific.”

Job classification, however, is more judgmental than chemistry. Chemists observe elements objectively and classify the elements with precision into categories of objective phenomenon, such as the categories in the Periodic Table of Elements. Job classifiers also observe work objectively; however, the classification system itself is a product of past and present values and circumstances, not a description of physical facts. Rather than a Periodic Table of Elements, the fundamental criterion of a job classification system is a hierarchy of jobs or job elements. The hierarchy consists of level relationships considered necessary for legitimacy of the classification system in a particular context. It is this hierarchy of jobs or job elements that any job classification system must reliably reproduce and rationalize. This hierarchy is the criterion used to develop the job classification system.

Within occupations, different levels or hierarchies of work reflect aspects valued more (e.g., the work of training others) and aspects valued less (e.g., working at a trainee level). Between and among occupations, differences depend on customary groupings of skills and knowledge in the labor market and the

educational system. Present groupings of skills and knowledge reflect how past occupations responded to opportunities and accidents of history. On the early Western frontier, the occupation of barber may have included the duties of dentist. When the occupation of barber separated into the two specialized occupations of barber and dentist, salaries of the specializations reflected what was valued more (dentistry) and what was valued relatively less (barbering) by labor markets past and present. Within a specific frame of reference, job classification can be used to systematically, predictably, and rationally replicate the hierarchy of values expressed in the criterion of the job classification system applied.

Results of job classification reflect values embedded in the selection of the job classification criterion, techniques, and coverage. Some societies, labor markets, or employers may value services of fully proficient barbers above those of fully proficient dentists. In those societies or labor markets, job classification systems would place jobs of fully proficient barbers in a higher pay range than jobs of fully proficient dentists.

Every job classification system rests on a criterion measure that embodies values. In the United States, the values typically echo those of the external labor market as it is experienced and interpreted by the employer at the time the classification criterion is chosen and the job classification system is established. In the mid-1970s, an interest in pay equity emerged and prompted some discussion of universal job evaluation systems. The idea of a universally applied classification criterion has not gained solid support in the United States. Relevant laws and judicial rulings typically define the standard for acceptable pay equity practice as the fair and consistent use by an employer of any professionally designed job classification system.^[2]

Job classification is presented in many personnel and human resources manuals as an objective, even scientific, process for determining job worth. This presentation is a partial truth. Job classification is, in essence, a systematic way of identifying correct relationships among jobs. The correctness of the relationships, however, is based on custom and culture as reflected in the criterion used to develop the job classification system. Correctness is not based on some scientifically verifiable fact or on a scientifically established theoretical model. Like the companion disciplines of budget and staffing, the scientific component of job classification is the “science” of management.

JOB CLASSIFICATION SYSTEMS AND TECHNIQUES

Different techniques of job classification involve codes, forms, and formats that appear to be very diverse.

Differences in codes, forms, and formats generate different jargon, and each requires mastery of a different vocabulary. However, if the same criterion is used, application of any of the techniques to the same job information should produce about the same job relationships and job structure. Consider, for example, the criterion of salary in the relevant labor market, and consider two different classification systems based on this criterion—a system using benchmark whole-job comparison, and a system using point factor evaluation. Formats, forms, and codes for classifying jobs under the two systems appear to be very different. However, classification of a group of jobs using the benchmark wholejob comparison should produce about the same job structure as classification of the same group of jobs using the point factor evaluation system. The two systems look different, but are fundamentally the same because both are based on the same criterion.

However, if the same type of classification system (e.g., a point factor system) is developed for two organizations, but each organization uses a different *criterion*, the job structure resulting from classification may be different. If organization A uses as a criterion the judgment of a committee of occupational analysts, and organization B uses the labor market, and if the analysts give “knowledge” more weight than does the relevant labor market, fully proficient librarian jobs may be placed above fully proficient secretary jobs in the structure of organization A, and below fully proficient secretary jobs in organization B, despite both organizations having used the same job classification technique.

Although different criteria may produce different job structures, culture and labor market dynamics influence all criteria toward conformity and stabilize long-term job relationships. Cultural values are shared by groups of experts within an occupation and by different employers, also by legislators in state governments or the U.S. Congress. These shared values influence views of the legitimacy of a job hierarchy. Criteria express values, and values are slow to change. Within occupations, relationships among different levels of work are stable. Fully proficient barbers have been paid more than barbers in training, at least since Medieval Europe.

Among occupations, however, relationships are less stable. Relationships among occupations are more likely to change in response to economic influences, especially in the short term. For example, a limited supply of electricians in an area of high demand could drive the market value of electricians above the market value of accountants. Responding to the opportunity for higher pay, trained electricians may be attracted from other areas or people may take training to become electricians and, over time, electricians may

be oversupplied in that area. Electrician wages may stop rising, and accountants may resume their previous place in the labor market hierarchy. Organizations that hire from the labor market or periodically adjust wages of employees to the labor market must adjust to changes in occupational relationships. Because most market changes are temporary fluctuations, it is often more appropriate to make temporary salary adjustments than to change a job classification system. The federal government's criterion measure for the classification system covering about 1 million white-collar jobs is expressed in legislation (Chapter 51 of Title 5, United States Code). The federal government adjusts to temporary market effects by paying "special rates" to certain occupations in certain areas. However, some of the market changes endure and require changes in the job classification systems to interface effectively with the labor market.

Other things being equal, if the criterion measure is the same, any or all the techniques applied to the same job information should produce about the same structure of jobs. Understanding the role of the criterion is the foundation to evaluation of a classification system. The efficacy of a job classification system is evaluated in terms of how well it supports classification of jobs such that the job hierarchy is an accurate reflection of the criterion. Understanding the role of the criterion is critical to assessing the currency and appropriateness of a job classification system, and to distinguishing between the need for temporary or fundamental system change. Each of the following techniques of job classification can be used to produce job structures consistent with a criterion measure chosen by an organization. A single criterion measure can apply to a broad group of diverse occupations, as in the case of the federal government system for classifying white-collar occupations, or to a smaller group of occupations.

Classifying Whole Jobs and Classifying Jobs Factor by Factor

Each of the following techniques may be used to classify a "whole job" or to classify a job factor by factor. Each job has a potentially limitless number of factors that could be considered in deciding its classification. Each technique discussed typically provides guidance as to whether to use whole job or factor-based classification. The advantages of wholejob classification include its simplicity and flexibility. The disadvantages of wholejob classification include the potential for inconsistency in classifying jobs due to the flexibility for each classifier to consider different factors or to weigh the same factors differently.

In both whole job and factor-based classification, consistency can be improved by having more than one classifier classify the job independently and subsequently reconciling their classification decisions, or by developing more specific guidance for classifying each group of jobs.

Factor-based classification specifies the number and nature of factors to be considered in classifying jobs. The advantages of factor-based classification include improved consistency in classifying jobs, and potentially more comprehensive records of the basis for classification decisions. The improved consistency is achieved by specifically guiding and limiting what is considered. Requirements to explicitly justify and document the basis for evaluation of each specific job factor potentially produce more comprehensive records. These advantages, however, come at a price—factor-based classification standards are more costly to develop and documentation required to record the basis for classification decisions is, overall, more extensive.

Ranking

In ranking systems, jobs are classified by being ranked in relation to each other by a group of raters who can credibly rate the jobs in the organization. Advantages of this technique include potential for minimal paperwork associated with classification and development of the job classification system and minimal cost. A disadvantage is that it is only as credible and defensible as the raters. The number of jobs that can be ranked effectively by any group of raters is limited, and only the original raters can authentically classify jobs consistently—that is, with reference to the same basis for judgments. This type of system may not be sustainable over time.

Benchmark Job Classification Standards

In benchmark systems, jobs are classified by reference to standards. The standard is composed of descriptions of actual jobs that exemplify each level of work. Advantages of this technique include the potential for less paperwork associated with classification of the jobs that match the benchmarks, the potential for application of the standards by as many people as are trained to use them, and the relative ease of communicating about classification of jobs that match benchmarks. A disadvantage of this technique is that it is only as credible as the process used to rank the benchmark jobs; also, jobs that do not match the benchmarks may be difficult to classify. This technique is most efficient for occupations in which there is not much variation within each level of work (e.g., journeyman level).

Narrative Job Classification Standards

Narrative job classification systems refer to standards consisting of narrative descriptions and examples of work at selected levels. There is usually a standard for each major occupational group of jobs, and the occupational standard usually describes each significant level of work within the occupation. Standards are often prefaced by a section giving general information about the occupation and describing features of work important in distinguishing one level within the occupation from another. Advantages of this technique include the potential for application of the standards by as many people as are trained to use them and the standards are typically general and can be applied to large numbers of jobs. Narrative standards allow flexibility for classifiers to weigh unique features of each job. The language distinguishing levels of work is explicit, and the standards provide a uniform basis for communicating about classification of work in an occupation. Disadvantages of narrative standards include the potential for inconsistency due to diverse interpretations of the general language describing each level of work in the occupation, and that the system is expensive to develop. Systems using narrative standards require “evaluation statements” to document the basis for classification decisions, and adequacy of statements may be uneven.

Points-Based Job Classification

Jobs are classified with reference to standards that are narrative descriptions explaining and exemplifying “points” in a range of point values. Although points may be used to express or combine multiple judgments of whole jobs, points almost always are associated with factor-based job classification systems. Advantages and disadvantages of the points-based job classification technique parallel those of narrative job classification. In factor-based systems, points restrict flexibility in judging the relative value of different aspects of work. Restricting flexibility improves consistency of ratings. For example, the work of an historian might match a higher level in respect to knowledge than in respect to authority. If the points for knowledge have greater weight in the overall classification, the job might be classified at the level of its knowledge. If the points for authority have greater weight, the job might be classified at the lower level. In the narrative type of job classification standard points are not included, which gives to whomever classifies the job more flexibility in determining which level is more appropriate for the historian.

Finally, the fundamental nature of all job classification techniques is to guide the process of

observation and decision making. Job classification is largely a judgmental process. Like personality, each job is unique. To classify a job requires reduction of the job to elements used in a particular classification system, and identifying the “best” match between the job and the appropriate classification standard. It is not surprising that different people sometimes reach different conclusions about the same job.

JOB CLASSIFICATION PROCESS

Classifying a job is the process of assigning to the job codes that represent the type and level of work assigned to the job. “Counseling Psychologist, GS-0180-13” is an example of a classification code. Job classification codes include by reference a great deal of information indicating the type and level of work, the qualifications characterizing a job, and the terms and conditions of the employment arrangement.

For the different job classification techniques discussed, the elements of the job classification process are essentially the same. The first step of the process is to describe the work to be assigned to the job. Although the job incumbent is usually consulted, supervisors usually control description of work assigned and may draft the description of the job. Approval of the job description by a second-line supervisor usually is required.

Classifying the job is the middle step of the job classification process. A job classification professional, a manager, a panel of peers, or a consultant may be responsible for matching the work of the job with the appropriate classification codes.

Job classification decisions usually require additional clearances and approvals before classification codes are assigned to a new job (or to a job that has changed). Assigning classification codes may affect other systems supported by job classification. For example, if a job has grown to a higher classification level, necessary clearances may be obtained and its incumbent may be promoted to a higher pay range. Some personnel or human resources systems require open competition for the “new” job at the higher level. If classification of a job reveals that new duties are “confidential management duties,” a decision may be made to withdraw the job from a union bargaining unit, triggering subsequent dealings with the union. When informed about the impacts of impending changes in classification codes, management in some systems has the opportunity to alter assigned duties so classification codes do not change in ways that have undesired consequences.

The final step in the job classification process is documentation of classification activity, reasoning, and outcomes. Documenting classification reasoning

permits detection of errors in observation or classification, and promotes consistency and perceived fairness by making transparent the basis for judgment. Requests for classification review may be frequent, and documenting classification activity helps to manage and monitor the work of classifying jobs. Documentation also facilitates making adjustments in other administrative systems that are caused by new or changed classification of a job. For example, changes in classification of a job may trigger changes in pay, training requirements, or bargaining unit membership. Even if the classification of a re-described job is not changed, when a job description has changed, other changes may be indicated (e.g., performance standards may have to be updated).

MANAGEMENT AND ACCOUNTABILITY

Job classification is, in its essence, an information system. As such, it is an important part of management systems for controlling personnel expenses and practices. The information made available by job classification, however, can be a vehicle for micromanagement by the U.S. Congress, state legislatures and other governing bodies, chief executives, budget directors, and others. Through job classification and its linkages to pay, staffing, and other types of practices, executives can dictate and monitor, among other things, exactly how many jobs will be available to do work, how much each job can be paid, and minimum qualifications required for each job. Managers and workers frequently chafe under the added demands and limitations of these types of top-down administrative controls.

However, job classification is a key instrumentality of government accountability. The merit system for the U.S. civil service initiated by the Pendleton Act of 1883 was an antidote to government corruption. Job classification is at the heart of any merit system. Reformers in the early 1900s saw job classification as a means for controlling patronage abuses. The work of government jobs would be defined, and the work of campaigning and soliciting campaign contributions would not be done on the public payroll. Only those qualified would be hired, and the qualifications required would be based on the work to be performed. Pay levels would be related to work performed, and jobs assigned equal work would be in the same pay range. In 1923, the U.S. government passed the Classification Act, which is the foundation of classification processes and approaches still used in the U.S. federal civil service.^[3]

The importance of job classification to public accountability is supported by its association with the emergence of merit systems in Central American governments following periods of political corruption.^[4]

The Draft Charter for Public Service in Africa implies adoption of merit systems for career civil service jobs and pay consistent with work—functions that are implemented and monitored using job classification codes.^[5]

MANAGING THE NEW WORKFORCE

Since the mid-1980s, management layering and team-based rationalization has reduced the number of middle-income jobs in the United States and restructured much of the workforce.^[6] The flatter, non-unionized, flexible workforce can be reorganized at almost Internet speed into different team configurations. Any given team may include both management and non-management members, both public and private sector members, both contingent and permanent employees, and both part- and full-time employees.

To the extent governments can simply “buy” services in the marketplace without regard to wage equity, credentialed qualifications, or other personnel rules, governments may simply specify the product desired. The challenge of managing work in this new environment would be passed on to contractors or teams agreeing to deliver the product. Whether it occurs inside or outside government organizations, management of work in the new environment requires even more information than managing work in traditional structures. Developing a bid, distributing work among teams, and assigning resources to teams requires some method of estimating amount of work. Recruiting from the labor market and making up teams requires identifying qualifications needed for jobs, matching qualifications with work, and matching work to be done with the “going rate” in the relevant labor market. To compare productivity of teams requires a way to identify teams that have comparable resources and work.

Job codes are essential information for managing and coordinating the new type of workforce, much as they have been for the traditional workforce. Traditional processes for providing the information, however, need to be improved to meet new demands. Flexibility of some linkages characterizing traditional civil service personnel systems might be increased. Some governments are considering “pay banding.” Also called “grade banding,” this type of system increases the number of levels of work covered in each pay range, thus decreasing the precision of job classification and possibly loosening the linkage of pay to the external labor market. Another approach would be to consider relaxing the linkage between level of work and level of qualifications in the manner of U.S. military systems. The military systems permit some assignments of persons to jobs classified at levels

above or below the person's level of qualifications and experience. Another approach to increased flexibility is breaking large, interlinked groups of occupations into subgroups. The U.S. government linkage of all white-collar occupations to the same classification criterion, for example, might be examined to determine feasibility of breaking occupations into smaller categories, each with a distinctive criterion, such as the professional, administrative, technical, and clerical categories widely used in the private sector.

CONCLUSION

Job classification creates the vocabulary that makes possible information linking work with pay, qualifications, and performance. It is the place where management responsibility and accountability often clash with the immediate needs and pressures of the workplace. Used widely in both public and private sectors, it is and has been a vital part of merit systems throughout the United States and around the world.

John Rawls

James R. Heichelbech

Graduate School of Public Affairs, University of Colorado at Denver,
Denver, Colorado, U.S.A.

INTRODUCTION

John Rawls was the most significant political philosopher in the United States during the 20th century. His work revitalized discussions of social equity in public administration and provided a focal point for critical reflection about social institutions. Publishing in over a hundred articles and books between 1950 and 2002, Rawls presented most of his ideas in three books: *A Theory of Justice*,^[1] *Political Liberalism*,^[2] and *Justice as Fairness: A Restatement*.^[3] The following includes a summary of the development of the theory of justice within these three books, a discussion of its significance for public administration and public policy, and a summary of criticisms.

A THEORY OF JUSTICE

A Theory of Justice is presented in three parts dealing with Theory, Institutions, and Ends. The first of these is undoubtedly the most important, as it presents the very idea of justice as fairness. Parts two and three concern the application of principles of justice and the relationship between these principles and *the good* (following the Kantian tradition of distinguishing the “right,” which concerns minimally necessary moral requirements, and the “good,” which concerns maximum positive happiness. Rawls explains the theory by clarifying the subject of justice, offering two principles of justice, and then presenting an argument for those principles from an *original position* behind a *veil of ignorance*.

The subject of justice, he says, concerns the basic structure of society—the way that social institutions distribute rights and duties resulting in division of advantages gained from social cooperation. The primary role of justice is to provide a standard for assessing the distributive aspects of the basic structure of society. Such principles are those that “free and rational persons concerned to further their own interests would accept in an initial position of equality as defining the fundamental terms of their association.” Justice as fairness views principles of justice as the basis for determining which kinds of social cooperation and forms of government are acceptable.^[1]

Rawls defines the basic structure of society as “the arrangement of major social institutions into one scheme of cooperation,” where an institution is understood as “a public system of rules which defines offices and positions with their rights and duties, powers and immunities, and the like,” and says that, ideally, “the rules should be set up so that men are led by their predominant interests to act in ways which further socially desirable ends.” To that end, Rawls offers two principles: “Each person is to have an equal right to the most extensive basic liberty compatible with a similar liberty for others,” and “Social and economic inequalities are to be arranged so that they are both 1) reasonably expected to be to everyone’s advantage and 2) attached to positions and offices open to all.”^[1]

An important feature of these principles concerns equality of opportunity. “The natural distribution,” he says, “is neither just nor unjust; nor is it unjust that persons are born into society at some particular position. These are simply natural facts. What is just and unjust is the way that institutions deal with those facts.” Accordingly, he suggests that a liberal interpretation of these two principles “mitigate the influence of social contingencies and natural fortune on distributive shares,” by requiring, for example, that “free market arrangements . . . be set within a framework of political legal institutions which regulate the overall trends of economic events, and preserves the social conditions necessary for fair equality of opportunity.”^[1]

The Original Position

The argument for these two principles uses the idea of the *original position*, a perspective from which we can devise a “fair procedure guaranteeing that any principle agreed to will be just.” As a preliminary step, Rawls lays out the formal constraints of the concept of right: “Principles should be general . . . It must be possible to formulate them in such a way that they are not tied to particulars . . . Principles are to be universal in application . . . The parties assume that they are choosing principles for a public conception of justice . . . [and] a conception of right must impose an ordering on conflicting claims.”^[1]

The appropriate position from which to arrive at principles within such constraints is that situated

behind a *veil of ignorance*. Although persons in the original position are rational, which means that “in choosing between principles each tries as best he can to advance his interests,” those behind the veil of ignorance do not know how their choice will affect their particular case and they are obliged to evaluate principles solely on the basis of general considerations. In other words, “while they know that they have some rational plan of life, they do not know the details of this plan, the particular ends and interests which is calculated to promote.”^[1]

This strategy for devising principles of justice reflects the deontological character of the theory. Rawls tells us that his aim is “to work out a theory of justice that represents an alternative to utilitarian thought generally,” which he describes as the idea that “society is rightly ordered, and therefore just, when its major institutions are arranged so as to achieve the greatest net balance of satisfaction summed over all the individuals belonging to it.” The primary difference between a theory of justice as fairness and utilitarianism, according to Rawls, is that “utilitarianism is a teleological theory whereas justice as fairness is not.” It follows, then, that justice as fairness “is a deontological theory, one that either does not specify the good independently from the right, or does not interpret the right as maximizing the good.” Priority of the *right* over the *good* is an important deontological feature of justice as fairness, for it restricts the basic structure of society in ways that a utilitarian account could not. Whereas any and every desire has some value from a utilitarian perspective, those in the original position agree “to conform their conceptions of their good to what the principles of justice require.” In other words, principles of justice, as principles of right, allow us to distinguish satisfactions that have value from those that do not and thereby define a reasonable conception of one’s good.^[4]

Political Liberalism

Political Liberalism is also presented in three parts, Fundamental Ideas, Three Main Ideas, and Institutional Framework. And again, the first part is critical for understanding the development of Rawls’s position. Here Rawls attempts to show how it is possible that “there may exist over time a stable and just society of free and equal citizens profoundly divided by reasonable though incompatible religious, philosophical, and moral doctrines,” and how “deeply opposed though reasonable comprehensive doctrines may live together and all affirm the political conception of a constitutional regime.” In other words, Rawls hopes to “work out a conception of political justice for a

constitutional democratic regime that the plurality of reasonable doctrines . . . might endorse.”^[2]

One of the primary tasks is to clarify justice as fairness as a *political* conception. Given the fact of reasonable pluralism, that a “diversity of reasonable comprehensive religious, philosophical, and moral doctrines found in modern democratic societies . . . is a permanent feature of the public culture of democracy,” justice as fairness is presented as “a conception of justice that may be shared by citizens as a basis of a reasoned, informed, and willing political agreement.” Such a conception, he says, should remain “independent of the opposing and conflicting philosophical and religious doctrines that citizens affirm” so that we “gain the support of an overlapping consensus of reasonable religious, philosophical, and moral doctrines.”^[2]

Rawls explains that a political conception of justice has three characteristic features. First, it is a moral conception to the extent that it is worked out for political, social, and economic institutions. Second, it is a “freestanding view,” which means that it is distinguishable from any comprehensive doctrine that it might be part of or derived from. Third, it is expressed in terms of ideas that are implicit in the public political culture of a democratic society.^[2]

Although the remainder of *Political Liberalism* certainly provides important details, most of the discussion serves to clarify concerns related to this political conception of justice. However, it is worth noting the three main ideas of political liberalism described in the second part. The first is the idea of an “overlapping consensus,” in which “the reasonable doctrines endorse the political conception, each from its own point of view.” The second is the priority of the right, which means that a political conception of justice limits conceptions of the *good*. And the third is the idea of public reason. Rawls explains that public reason is public in three ways: as the reason of citizens, its subject is the good of the public and fundamental justice, and its content is public.^[2]

Justice as Fairness: A Restatement

Here Rawls revises the two principles of justice. Second, he reorganizes the argument for those principles. Finally, he revises his understanding of justice as fairness, now understood “as a political conception of justice rather than as part of a comprehensive moral doctrine.”^[3]

While Rawls has quite a bit to say about his revised principles, there are no radical changes and the arguments for them are more of an adjustment than a departure from the original formulation. The revised principles are: “1) Each person has the infeasible

claim to a fully adequate scheme of equal liberties, which scheme is compatible with the same scheme of liberties for all. 2) Social and economic inequalities are to satisfy two conditions: first, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; and second, they are to be to the greatest benefit of the least-advantaged members of society (the difference principle).’’^[3]

On the other hand, while the explanation of justice as fairness as a political conception is similar to what Rawls presented in *Political Liberalism*, he provides additional clarification of the idea of free and equal persons within such a conception. “Justice as fairness,” he says, “regards citizens engaged in social cooperation, and hence as fully capable of doing so, and this over a complete life.” Accordingly, persons are assumed to have two moral powers, the capacity for a sense of justice and a capacity for a conception of the good. He describes a conception of the good as “an ordered family of final ends and aims which specifies a person’s conception of what is of value in human life or, alternatively, of what is regarded as a fully worthwhile life.” Such persons are equal in having these two moral powers and are free both because they “conceive of themselves and of one another as having the moral power to have a conception of the good,” and because they “regard themselves as being entitled to make claims on their institutions so as to advance their conceptions of the good.”^[3]

RAWLS AND PUBLIC ADMINISTRATION

Rawls’s work had and continues to have a profound impact on the normative dimensions of public administration and public policy. According to Terry Cooper, the publication of *A Theory of Justice* coincided with the development of administrative ethics as a field of study, especially significant with respect to social equity as an important part of the New Public Administration emerging in the late 1960s. In particular, he says, two essays contributed directly to administrative ethics as a field of study: “Social Equity and Organizational Man: Motivation and Organizational Democracy” by Michael Harmon and “Social Equity, Justice, and the Equitable Administrator” by David K. Hart.^[4,5] Both focused on the Rawlsian conception of social equity as applicable to public administration, “thus providing evidence of the practical significance of administrative ethics and building confidence in the possibility of developing it as a field of study.”^[6]

In practical terms, two aspects of the Rawlsian perspective have been important within discussions of ethical public institutions. First, the requirement of impartiality, which is implicit within the very idea of

neutral competence or merit system, gained theoretical grounding as an axiom of ethical decision making in the public sector. Second, the Rawlsian conception of political justice required attention to distributive inequities and helped articulate the basis for various policy initiatives, such as affirmative action. In other words, Rawls provided a practically useful argument for demanding equity both in decision-making processes and in determining who should benefit from them.

CRITICISMS OF RAWLS

The primary sources of criticism have come from communitarian and feminist perspectives. Stephen Mulhall and Adam Swift present a concise summary of various communitarian criticisms of Rawls offered by such theorists as Charles Taylor, Michael Sandel, Michael Walzer, and Alasdair MacIntyre, who argue that the liberal emphasis on the individual implies a “neglect of the formative significance of their social context and the moral significance of relations between them.”^[7] Mulhall and Swift identify four types of criticisms along these lines. First, the Rawlsian conception of the person requires a radical detachment from one’s nature and ends that is psychologically impossible and deprives one of resources needed to reason about social justice. Second, this asocial individualism neglects the extent to which the societies in which people live shape who they are and what values they have. Third, while Rawls requires the theory to be universally applied, it cannot take into account the different ways in which different cultures embody values and practices. Finally, while Rawls emphasizes the neutrality of the theory with respect to comprehensive doctrines, he “smuggles” in particular ideas of the good life for human beings.

Feminist criticisms of Rawls are of two sorts. One is a methodological concern about the legitimacy of the detached perspective of the original position. Another deals with concerns about the application of principles of justice to particular institutions, such as family.

Just as communitarian criticisms focus on the culturally nonneutral conception of rationality reflected in the original position, feminists point out that the original position reflects a gendered conception of rationality. For example, Carol Gilligan’s account of differences in moral reasoning between boys and girls helped clarify the ways in which abstract, detached, and rule-oriented conceptions of moral reasoning can be considered gender-specific. “Listening to people talking about morality and about themselves,” Gilligan “began to hear a distinction in these voices, two ways of speaking about moral problems, two modes of describing the relationship between other and self.” She distinguishes these two voices in terms

of a contrast between an ethic of *justice* and an ethic of *care*—“the logic underlying an ethic of care is a psychological logic of relationships, which contrasts with the formal logic of fairness that informs the justice approach.” The ethic of care “evolves around a central insight, that self and other are interdependent” and “a consciousness of the dynamics of human relationships then becomes central to moral understanding.”^[8]

These insights have been developed further in various ways. Martha Nussbaum provides a succinct overview of a rather diverse set of criticisms. For example, some argue that because “rationality of the parties in the original position is described as self-interested prudential rationality,” and “the parties are characterized as mutually disinterested, unaware of strong ties to others,” it discounts emotionally grounded approaches to moral reasoning and favors an egoistic conception of human beings. Those influenced by the work of Jurgen Habermas also question the “monological” nature of the original position in which “the parties are imagined as basically all alike, and as reasoning on their own, rather than exchanging claims and counterclaims in a dialogue in which different perspectives can be presented and investigated.”^[9]

In contrast to the methodological concern about how the principles of justice are chosen, feminists have also questioned the limited application of those principles of justice.

In *Justice, Gender, and the Family*, Susan Moller Okin suggests that Rawls’s assumption that those in the original position are heads of families “is far from being neutral or innocent,” for it “has the effect of banishing a large sphere of human life and a particularly large sphere of most women’s lives from the scope of the theory.”^[10] Although Rawls assumes that individuals have a sense of justice, he does not explain his assumption that family institutions are just. Still, Okin acknowledges that if we assume that those behind the veil of ignorance do not know their sex, there is implicit in Rawls’s theory a potential critique of social institutions with respect to gender.^[10]

CONCLUSION

Although Rawls has acknowledged that principles of justice have some application to social institutions,

such as family, his responses to both communitarian and feminist criticisms tend to reemphasize the importance of a political conception of justice derived apart from more comprehensive conceptions. And it is worth noting that he consistently offers his account as merely part of a more complete story about social institutions. From the perspective of public administration and public policy, this resonates with the treatment of social equity as merely part of what we need to consider when we think about ethical public institutions. However, he argues that justice as fairness is implicit within a commitment to democratic institutions, and therefore the relative priority of social equity reflects the relative priority of democracy itself.

Judicial Ethics

David A. Yalof

Department of Political Science, University of Connecticut, Storrs, Connecticut, U.S.A.

INTRODUCTION

Our nation's judicial system rests on the theory that a neutral and competent arbiter of disputes (the judge) provides the most effective means of resolving legal disputes among competing parties. Judges are responsible for defining each party's legal rights and responsibilities, allocating resources, and supervising the actions of public officials, among other tasks. In carrying out these duties, the willingness of each judge to respect and honor the judicial office as a public trust is considered fundamental to the success of the system; if members of the judiciary are not held to the highest standards of integrity and independence—or if there is even an appearance of impropriety in their actions—confidence in the judicial system may break down.

For well over a century, much attention has been paid to the ethical conduct of lawyers, who must balance the duty to provide zealous representation of their clients with their sometimes conflicting responsibilities as officers of the Court. Considerably less attention—scholarly or otherwise—has been paid to judicial ethics. In court, judges may be held to even higher standards of integrity than those to which lawyers or other participants in the process normally are held. Outside of court, a judge may still be held to exceedingly high standards of honesty and propriety, as private actions may also reflect on the judge's capacity to perform judicial functions with impartiality. Although judges certainly can (and often do) maintain some personal opinions on broad legal issues, the premise that judges can nevertheless be open minded and impartial regarding the specific legal issues and parties that come before them remains a bedrock principle of our legal system.

EXAMPLES OF ETHICAL DILEMMAS FACED BY JUDGES

Ethical considerations inevitably play a part in many of the decisions made by judges during their tenure on the bench. Unfortunately, the rules and laws that guide judicial conduct only go so far in specifying detailed responses to every possible situation a judge may face. For example, what role can a judge play in participating in public affairs when not actually

presiding over court? To maintain the appearance of propriety, a judge probably should avoid actively campaigning for political candidates or assisting in raising funds for political campaigns. But what about public service activities that call (at least in part) upon a judge's expertise in interpreting facts and the law? In 1946, Justice Robert Jackson temporarily stepped down from his position on the United States Supreme Court to serve as the federal government's chief prosecutor at the Nuremberg War trials. Immediately after President John Kennedy was killed in November of 1963, Chief Justice Earl Warren of the U.S. Supreme Court accepted President Lyndon Johnson's appointment to chair the commission investigating the circumstances that led to President Kennedy's assassination. On a lesser scale, local court judges are often asked to serve on various boards and committees in their home communities. Under what circumstances might such extra-judicial political activities compromise a judge's independence, or at least create the appearance of impropriety?

Financial conflicts of interest pose another ethical minefield for judges. Normally, we would expect judges to disqualify themselves from presiding over cases whenever their impartiality might be "reasonably" questioned. But what does the phrase "reasonably" entail? One judge was replaced in litigation involving the Exxon Corporation when his wife inherited less than one—one billionth of the stock of that company. Another judge stepped down from an antitrust case, because a family member owned less than 10 shares in one of the 2000 corporate parties involved in the litigation. Over 30 years ago, a federal appellate judge (Clement Haynsworth) was denied an appointment to the U.S. Supreme Court, largely because while serving on the corporate board of the Carolina Vend-A-Matic Corporation ("CVAC"), he had supervised a case involving a second company whose parent entity held \$50,000 worth of contracts with CVAC. When is a financial conflict significant enough that it requires a judge to recuse himself from all matters related to the conflict?

A third area of judicial ethics concerns on-the-bench judicial decision making that may, under certain circumstances, constitute an abuse of power. When a judge commits a legal error, it is generally a matter for legal appeal, rather than a question of judicial

misconduct. Still, some errors are so egregious (and perhaps deliberate) that they might be considered unethical, provoking calls for sanctions against the judicial offender. Judges have occasionally been disciplined for disposing of cases summarily without allowing an opportunity for even minimal adversary proceedings. One judge was sanctioned for coercing parties into disposing of their cases out of fear or intimidation. Judges cannot make inappropriate comments that demonstrate bias or insensitivity to the parties before them. In general, judges are required to administer justice through a faithful and competent application of the law. Yet when do judicial decisions cross the line from mere error into an improper use (or even outright “abuse”) of power?

The above examples barely scrape the surface of potential judicial misconduct. Once assuming judicial office, an individual must be prepared to navigate through a maze of ethical considerations, most of which are accompanied by ambiguous instructions and heavily qualified guidelines.

HISTORY OF JUDICIAL ETHICS

Prior to the 1960s, judicial misconduct in the United States was addressed almost exclusively through formal removal procedures, whether by impeachment, a bill of address passed by a legislature, or recall by the people. Because such remedies are quite extreme and cumbersome, they were only rarely utilized. (Legislatures may have also been wary of how frequent threats of removal might hamper judicial independence.) Consequently, many cases of judicial misconduct went unaddressed or ignored for much of our nation’s history.

At least some of the blame for this state of inaction lay with the legal profession’s governing body, the American Bar Association (ABA). The ABA’s lone attempt at formulating standards of judicial ethics proved an almost total failure: the original “Canons of Judicial Ethics” (promulgated by the ABA in 1924) were universally criticized as amounting to mere statements of “moral posturing” that provided little guidance in answering difficult questions of judicial ethics.

Beginning in the 1960s, however, the federal government and various state governments began to adopt new mechanisms for disciplining judicial misconduct. Their efforts focused on the adoption of formal codes of judicial misconduct and the creation of official judicial conduct organizations authorized to investigate and discipline judges. Finally in 1972, the ABA promulgated a new Model of Judicial Conduct to replace the mostly ignored Canons it had formulated almost a half-century earlier. In less than two decades, the 1972 Code was adopted (albeit with minor variations) by 47 states, the District of Columbia, and the

Federal Judicial Conference, which oversees judicial misconduct in federal courts. In 1990, a revised Model Code was adopted, and in the decade that followed, an additional 23 states adopted this new version of the code, which featured the use of gender-neutral language and other minor alterations. To date, 49 of 50 states have adopted some version of one or the other of these codes. (The lone holdout has been Montana, which created its own set of rules of judicial conduct.)

THE CODE OF JUDICIAL CONDUCT

Both the Model Code of Judicial Conduct promulgated in 1972 and the 1990 revised version of the code set forth the same basic standards that govern judicial conduct in and out of the nation’s courts. Although the codes are intended to provide a framework for disciplinary agencies to regulate conduct, they provide no basis for civil liability or criminal prosecution.

In both versions, Canon 1 requires judges to “uphold the integrity and independence of the judiciary.” It is in every sense the “philosophical backdrop” of the entire document; the other provisions of the code give substance to Canon 1.

Canon 2 requires judges to “avoid impropriety and the appearance of impropriety” in all of their activities. In the 1990 version of the code, Canon 2 admonishes judges to adhere to the most broadly accepted norms of social conduct in three specific ways:

- A judge must “respect and comply with the law” and shall act in a manner that “promotes public confidence in the integrity and impartiality of the judiciary.”
- A judge cannot allow personal or political relationships to influence “judicial conduct or judgment” and cannot lend the prestige of the office to advance the private interests of others, whether by conveying the appearance of favoritism or by testifying voluntarily as a character witness.
- A judge may not hold membership in “any organization that practices invidious discrimination on the basis of race, sex, religion or national origin.”

Because a judge’s actions often come under intense public scrutiny, the code specifically imposes burdens that separate a judge from ordinary citizens. According to the official ABA commentary accompanying Canon 2, the test for “appearance of impropriety” is whether the conduct would “create in reasonable minds a perception that the judge’s ability to carry out judicial responsibilities with integrity, impartiality and competence is impaired.” Under this provision, judges are encouraged to disqualify themselves whenever they

maintain a formal financial interest, personal relationship, or any other type of interest in the parties, litigation, or subject matter at hand. Informal appearances matter as well. (Consistent with Canon 2, at least one judge was disqualified for sitting at a lunch table with counsel during breaks, even though there was no evidence of any inappropriate discussion.)

Canon 3 of both codes provides that judges should perform the duties of their office “impartially and diligently.” Those duties include numerous adjudicative and administrative responsibilities, disciplinary responsibilities, and self-disqualification whenever the circumstances of the situation demand it.

The drafters of the 1990 Code of Judicial Conduct combined former Canons 4, 5, and 6 of the 1972 code into one Canon 4 that deals comprehensively with off-the-bench conduct. This new Canon 4 specifically prohibits judges from participating in extra-judicial activities that may cast doubt on their capacity to judge impartially, demean the judicial office, or interfere with the proper performance of judicial duties. Canon 4 does *not* restrict judges from engaging in various avocational activities (writing, lecturing, teaching, etc.); serving as a non-legal officer or advisor for an agency dedicated to the improvement of law, or as a part of a non-profit educational, religious, or charitable organization; or managing family financial affairs. But, judges are restricted from taking on extra-judicial assignments in government that are unrelated to the general improvement of law; engaging in business dealings that may be perceived as exploiting the judge’s position on the bench; receiving improper gifts or loans; and serving as a fiduciary in proceedings that might come before him. A judge may not practice law, except in an unpaid manner to draft or review documents for a family member.

Finally, Canon 5 of the 1990 code essentially reinstitutes Canon 7 of the 1972 code, which orders judges to “refrain from inappropriate political activity.” Judges are admonished to avoid active participation in political organizations and must resign from judicial office upon becoming a candidate for a non-judicial government position. As a candidate for judicial office, a sitting judge must “maintain the dignity appropriate to judicial office” while he is campaigning; thus, the judge cannot personally raise funds for office, even if subject to a public election. And, a judge cannot even speak to a political gathering until becoming a formal candidate for election. This final canon has been a source of some controversy, as judges seeking reelection have had to wrestle with the demands of a hard-fought campaign for office. Specifically, how does a judge defend positions on the campaign trail, while at the same time “maintaining the appropriate dignity” of the judicial office? Certainly, candidates for judicial office enjoy some leeway in criticizing opponents, but such

criticism should not bring the judge’s impartiality into question. As the reporter for the drafting committee of the original code explained, this complicated set of rules amounts to a set of “compromises between political reality and the aim of maintaining the appearance of judicial impartiality.”^a

PROCEDURES FOR DISCIPLINING JUDGES

Along with the proliferation of federal and state judicial ethics codes patterned after the Model Code, numerous new judicial conduct organizations were established in the middle part of the twentieth century to consider legitimate accusations of judicial misconduct and to supervise the application of judicial ethics provisions to offending judges.

In 1960, California became the first state to create a permanent state commission responsible for regulating judicial conduct, and other states quickly followed suit. By the early 1980s, all 50 states and the District of Columbia maintained organizations with the authority to investigate and prosecute judges for misbehavior. Unlike in earlier periods, outright removal was not the only penalty available to public authorities; most of these organizations enjoyed the power to impose or recommend sanctions ranging from simple admonishment to temporary suspensions, as well as removal.

To oversee judicial misconduct in the federal judicial system, Congress in 1980 passed the Judicial Councils Reform and Judicial Conduct and Disability Act, which created judicial councils in each federal circuit charged with reviewing complaints against judges and, where appropriate, ordering sanctions. As with state commissions, these judicial councils can impose a range of sanctions under the act; however, Congress specifically withheld power from such councils to remove a federal judge outright from office, on the theory that Congress enjoys the authority to remove duly appointed federal judges by impeachment under the Constitution.

Although early critics of judicial misconduct commissions and councils feared they would pose a serious threat to judicial independence, the structure of the system acts to allay any such fears. In each jurisdiction, judges play a role at every step of the process (in some states, judges actually comprise a majority of the commission’s membership). Moreover, decisions rendered by such commissions are appealable to another judicial court, transforming the process into a system

^aJeffrey Shaman, Steven Lubet and James Alfini, Eds.; *Judicial Conduct and Ethics*, 3rd Ed.; New York: Matthew Bender, 2000; 365 pp. (quoting E.W. Thode, *Reporter’s Notes to the Code of Judicial Conduct* (1973), p. 96.)

of “self-regulation” in which threats to judicial independence carry little credence.

In addition to the formal sanctions available to a judicial commission or council, Congress and individual state legislatures can also remove judges accused of certain specified levels of misconduct. Under the federal Constitution, a majority of the House of Representatives can impeach federal officers (including judges) for “Treason, Bribery, or other High Crimes and Misdemeanors;” the Senate then enjoys the sole power to try the judge on the impeachment charges and remove the judge from office if found guilty by a two-thirds majority. Most state constitutions refer to “criminal activity,” “serious malfeasance,” or “gross incompetence” as possible grounds for impeachment.

Although the procedures governing systems of judicial discipline vary widely from state to state, there are at least two general categories of systems currently in place. Forty-one states and the District of Columbia have adopted a “one-tier system,” in which a panel composed of judges, lawyers, and even some non-lawyers handles every aspect of the process, from the filing of complaints to the prosecution of charges, the conduct of hearings, and the issuing of a formal recommendation on sanctions. Some states require that the state’s highest court actually impose the sanctions; in other states, the panel may impose sanctions directly. Nine states feature a “two-tiered system” in which a panel investigates and prosecutes formal charges, but an entirely separate panel actually adjudicates the charges and makes a final disposition.

No matter which system is utilized, judicial conduct councils and commissions function as the equivalent of non-criminal investigatory bodies in which discovery occurs and procedural due process rights (including the right to counsel) must be provided. The records of all such proceedings are generally kept confidential, although many commissions at least provide for disclosure to the judge of the identity of the complainant and any witnesses.

CONCLUSION

Just as ethical standards applicable to lawyers must evolve as circumstances in the legal profession and

the court system change, so are standards of judicial ethics shaped by shifting circumstances affecting the selection, performance, and extra-judicial activities of judges. Today, judges participate in a myriad of activities in their local communities; much of that participation might have seemed imprudent as recently as a few decades ago. To stay relevant, the Canons of judicial ethics must therefore be flexible enough to react to these real-world changes, and yet stable enough so that they may provide useful reference points for judges who must rely on them for guidance on a continuing basis. Clearly, an interested observer looking for the most up-to-date understandings and interpretations of judicial ethics would be well-advised to look beyond the language and commentary of the Canons of Judicial ethics. Specifically, a number of Internet sources may be helpful in this regard, including web sites associated with the American Bar Association (<http://www.abanet.org/home.html>); the Federal Judicial Conference (<http://www.uscourts.gov/judconf.html>); and the American Judicature Society (<http://www.ajs.org/ethics1.html>). Additionally, one should actively consult web sites administered by each individual state’s judicial system, which may feature links to state variations on the Model Code, as well as to state judicial opinions interpreting various provisions on judicial ethics.

Judicial Independence

Ian Greene

*Department of Political Science, York University,
Toronto, Ontario, Canada*

INTRODUCTION

A key feature of jurisdictions that practice the rule of law is an independent judiciary. This principle means that judges must be in a position, and also perceived by the public to be in a position, to make judgements about the cases before them as impartially as possible. Any attempts to influence a judge's decision outside of the rules of the courtroom are violations of judicial independence, whether from elected politicians, public servants, or private interests. Illicit attempts to influence judges might be direct, such as bribes, threats, or a telephone call from a government official. Indirect breaches of judicial independence might take the form of manipulations of the salaries or working conditions of judges who fail to tow a particular line, or they might involve exploitation of the administrative arrangements or structures of courts with the intention of swaying judicial decisions. Imprudent practices by interest groups, politicians, or the media might also threaten judicial independence.

DEVELOPMENT OF JUDICIAL INDEPENDENCE

Judicial independence evolved along with the struggle for the rule of law. The victors in the Glorious Revolution in England in 1688 had fought for the supremacy of Parliament and its laws over arbitrary decrees by the monarch, and they also demanded an independent judiciary to apply the law evenhandedly. Judicial independence was officially recognized in 1701 in the Act of Settlement, which guaranteed security of tenure for superior court judges of the central courts and protected judicial salaries from tampering by the executive. Prior to 1688, however, there had been a number of attempts to further the cause of the supremacy of the law and judicial independence. In 1329, the Statute of Northampton "declared that no royal command shall disturb the course of the common law, and that if such a command is issued, the judges shall ignore it."^[1] Because judges served at the pleasure of the monarch, however, their desire to keep their judicial appointments and their income often outweighed their resolve to decide independently. Nevertheless, the growing popularity of the ideal of judicial

independence sometimes restrained monarchs from removing independently-minded judges.^[2]

After 1688, the major theoretical defense of the idea of an independent judiciary was provided by John Locke, who argued for "indifferent" judges to settle disputes about the application of the law so that the law would "not be varied in particular Cases, but [there should be] one Rule for the Rich and Poor, for the Favourite at Court, and the Country Man at Plough." For Locke, it was particularly important for members of the government to be subject to the equal application of the law, so that no one would be "a judge in his own case."^[3]

MECHANISMS FOR PROTECTION OF JUDICIAL INDEPENDENCE

The two means for protecting judicial independence in the Act of Settlement were appointment of central superior court judges for life during good behavior and the establishment of judicial salaries by Parliament. Prior to this time, judicial appointments had been at pleasure, meaning that the monarch could remove judges whose decisions he or she disagreed with. "During good behaviour" meant that judges could only be removed by a joint address of both houses of Parliament, and then only because of behavior inappropriate for a judge (such as accepting a bribe, consistently failing to attend at court hearings, or a serious lapse in morals). There has been only one serious attempt to remove a central court judge since 1714, and that was with regard to a judge accused of accepting bribes in the nineteenth century.^[4]

THE AMERICAN REVOLUTION AND THE SEPARATION OF POWERS

It is ironic that the principles of judicial independence that progressive Britons had struggled so hard to achieve near the beginning of the eighteenth century were not applied to the colonies. The failure of the colonial authorities to institute judicial independence was one of the grievances that led to the American revolution. The framers of the 1789 constitution were

familiar not only with the arguments of John Locke but also with those of William Blackstone and Montesquieu. Blackstone described the separation of powers that had developed between the judiciary and the other branches of government.^[5] Montesquieu, writing in the mid-eighteenth century, attributed the apparent success of the English system of government in preserving liberty to the separation of governmental powers into the legislative, executive, and judicial branches.^[6] He seemed unaware of the development of cabinet government in the United Kingdom about that time, which fused the executive and legislative branches, while continuing to treat the judiciary as a separate branch, more or less. The separation of the judiciary from the other two branches of government has never been as complete in the United Kingdom as in the United States. For example, the Lord Chancellor is both a cabinet minister and the head of the judiciary, and the law lords of the House of Lords constitute the final court of appeal. In the United Kingdom as in some other Commonwealth countries, constitutional conventions, or principles of appropriate behavior, limit the intermingling of the judiciary with the other branches of government, and are a major safeguard of judicial independence.^[1]

The theory of the separation of powers was adopted by constitutional framers in the United States. Adams wrote, "The judicial power ought to be distinct from both the legislative and executive and independent upon both, so it may be a check upon both."^[7] According to Madison, "The accumulation of all powers, legislative, executive, and judiciary, in the same hands . . . may justly be pronounced the very definition of tyranny."^[8] And Hamilton, referring to Montesquieu, argued that "liberty . . . would have everything to fear from [the judiciary's] union with either of the other departments . . ."^[9,10]

The result of the constitutional debates was Article 3 of the U.S. Constitution, which describes the "judicial power of the United States." Article 3 was intended to be "a pillar of the separation of powers designed to provide genuine judicial independence."^[11] In Article 3, we see the two mechanisms for protecting judicial independence developed by the Act of Settlement, security of tenure, and establishment of judicial salaries: "The Judges, both of the supreme and inferior courts shall hold their Offices during good Behavior, and shall at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office." Federally appointed judges may be removed through impeachment by the House of Representatives and conviction by the Senate. Article 3 does not apply to the State judiciaries, which have developed their own methods for protecting judicial independence. These usually include safeguards for judicial salaries to prevent arbitrary

tampering and security of tenure during fixed terms (renewable by appointment or election) and sometimes during appointments to retirement.

Between 1803 and 1989, seven federally appointed judges were impeached and convicted, and six others were impeached. Six of those convicted were District Court judges, and one was a Commerce Court judge. The reasons for the convictions included loose morals, frequent drunkenness, conviction for serious criminal charges such as tax evasion or perjury, or accepting bribes. A judge was convicted in 1862 for supporting the Confederate side in the Civil War.^a

Every liberal democracy claims to have an independent judiciary, as well as administrative tribunals which, although not often possessing the same guarantees of judicial independence as judges, nevertheless, are intended to decide the issues that come before them impartially. Judicial independence often has constitutional status and safeguards, although constitutional safeguards are neither a necessary nor a sufficient condition for judicial independence. The test for judicial independence is the degree to which judges feel they can decide impartially, without undue influence from outside the courtroom.

THREATS TO JUDICIAL INDEPENDENCE

Peter Russell has suggested that the threats to judicial independence can be sorted into four categories: structural, personnel, administrative, and direct.^[12] To this list can be added a fifth category: societal.

Structural

Even if courts have constitutional protection, legislatures can often alter the size and the jurisdiction of courts. If such alteration occurs as an attempt to influence the judges' decision making, then judicial independence becomes an issue. Perhaps the most famous example of a structural threat to judicial independence was President Franklin Roosevelt's proposed legislation to increase the number of judges on the Supreme Court by six in 1937. The plan was a reaction to the fact that the Court had struck down 16 New Deal laws in a little over a year. The six new positions would have allowed Roosevelt to appoint additional judges more sympathetic to the New Deal. Although the New Deal was popular, Roosevelt's attempt to erode judicial independence was not, and Roosevelt withdrew the controversial legislation. In the end, after one of the

^aNine other judges resigned before they could be formally impeached (Ref.^[11]).

conservative judges changed his mind about the New Deal legislation, and after Roosevelt had a chance to appoint a judge, the Court stopped striking down the New Deal laws.^[11]

The transfer of jurisdiction away from a court or tribunal so that a government can reduce the caseload of judges appointed by a different government, or the reorganization of a court to make redundant the jobs of judges unpopular with the government, are also examples of the structural threats to judicial independence that occasionally occur even in liberal democracies.^[13]

Personnel

Personnel issues focus around hiring, promotion, remuneration, and firing. The three systems of judicial selection are appointment by the government (either through partisan or nonpartisan procedures), acceptance into a career judiciary through competitive examinations (as in many civil law jurisdictions), and popular election, as in many U.S. States. The non-partisan appointment method and the competitive examination method are the most compatible with the promotion of judicial impartiality and, therefore, independence, while popular election (especially when combined with periodical subsequent confirmation elections) may pose the greatest risk.

The system of judicial promotions may leave open the possibility that judges may be rewarded for pursuing a particular ideological line in their decision making. In Canada, although judicial selection advisory committees have helped to promote more non-partisan systems for judicial appointment to the trial level in most jurisdictions, the federal cabinet's rationale for elevating trial judges to the appellate level remains shrouded in secrecy. And in Japan, it may be that lower court judges hoping for a promotion tend to adopt the ideological orientation of the judicial elite responsible for making judicial promotions.^[14]

It is well established that independent judges cannot have their salaries reduced except during times of economic crisis, and judges must not be treated more harshly than others on the public payroll during such periods. How to determine judicial salary increases is a more thorny issue. It is not easy to conduct salary negotiations between the judiciary and the executive in a way that avoids the appearance of violating judicial independence. In 1997, the Canadian Supreme Court declared that judicial independence requires the creation of independent judicial compensation commissions to recommend adjustments of judicial salaries

on a triennial basis. The Court required governments to be prepared to demonstrate that the recommendations of the commissions were given serious consideration.^b This decision has raised the question of whether judges can sometimes exaggerate the scope of judicial independence in order to protect professional autonomy interests unrelated to judicial impartiality. Whether administrative tribunals and Justices of the Peace also require compensation commissions is a hot topic currently being litigated in Canada.

Independent judges cannot be removed because their decisions are unpopular or because of alleged errors in their reasoning, but only when it has been demonstrated through an impartial process that the judge is not capable of undertaking judicial duties fairly and impartially. In 2001, Zimbabwean President Robert Mugabe encouraged state officials and veterans supporting his cause to threaten the safety of several Supreme Court judges who had found that the government's seizure of farms owned by whites was illegal. The result was the resignation of three judges, paving the way for new appointments who then declared the seizures lawful.^c A less blatant example of an attempt to pressure a judge to resign is the parliamentary enquiry established to consider allegations against a radical judge on Australia's High Court in 1986.^[13]

Administrative

Administrative practices in the courts have the potential to erode judicial independence in a number of ways. For example, prosecutors may be in a position to manipulate the case scheduling system so as to get the cases they are most concerned about before judges with a reputation of being sympathetic to prosecution arguments. Those who control the court's budget may use this power to reward judges who favor the administration's ideology by providing more prestigious working conditions. Worries by judges about the potential abuse of power by the executive branch caused the federal judiciary in the United States to push for and eventually achieve judicial control over court administration in 1939. The result is that the machinery of federal court administration is controlled by committees of judges. Although this system has advanced judicial independence in some ways, the disadvantage is that the courts may not be in a better position than before to obtain a reasonable budget allocation. As well, judges may not be as skilled in administration as those employed by the executive

^bReference re Remuneration of Judges of the Provincial Court of Prince Edward Island, [1997] 3 S.C.R., 1.

^cMugabe seized lands lawfully, court says. *National Post*, Dec. 5, 2001, A12, quoting from *Agence France-Presse* and *The Daily Telegraph*.

branch.^[15] In Canada, the Supreme Court has declared that in order to protect judicial independence, judges must have control over the case scheduling system, the assignment of judges to cases, and court sittings.^[16] The Court was not persuaded that judicial control over other aspects of court administration was necessary to protect judicial independence.

Threats to judicial independence can also come from within the judiciary. Chief judges who want the puisne judges to favor a particular ideological stance might, for example, reward compliant judges with more conference travel. On appellate courts, there is the danger that a chief justice might arrange panels so as to increase the likelihood of a particular outcome.

Direct

Direct threats to judicial independence can be blatant, such as attempts to bribe judges or to intimidate them with physical threats. The public criticism of judicial decisions by elected politicians may also threaten judicial independence, because judges cannot defend themselves through entering into a public debate without impugning their impartiality. As liberal democracies mature, however, conspicuous attempts to influence judges become infrequent. More subtle illicit contacts can, however, be just as damaging. Often, these more abstruse attempts to influence judges take the form of an informal chat or telephone call between a judge and an elected politician or senior administrative official, during which the judge is lobbied to handle a case in a particular way. This kind of contact with a judge represents undue influence, because it might result in an unfair advantage to the party attempting to influence the judge.

Societal

Societal threats to judicial independence include sensationalist media coverage of judicial proceedings or decisions, and demonstrations in front of courthouses that are intended to attract media attention and pressure judges to decide cases in a particular way. Judges in liberal democracies generally do not regard scathing critiques of their decisions in academic journals as a threat to judicial independence, because the writers are usually well-informed about legal issues, and academic analysis is regarded almost as a form of continuing legal education for judges. However, if media criticism is out of context, or seriously unbalanced, this can affect the judge's public reputation and family life. Because of judicial independence, judges may not enter into public debate to defend their decisions. Some judges fear that a conscious or unconscious desire to avoid being pilloried in the media might affect the

judicial reasoning process.^[17] On the other hand, if judges have security of tenure, their salaries may not be tampered with, and they are administratively secure, it is questionable whether societal threats to judicial independence are sometimes more perceived than real.

CONCLUSION

Judicial independence consists of arrangements to ensure that judges are in a position in which they feel they can decide cases as impartially as practically possible. The impartial application of the law is an important principle of liberal democratic government. Arrangements established to protect judicial independence usually include security of tenure until retirement or during a fixed term, the prohibition of tampering with judicial salaries to influence judicial decision making, and providing judges with control over administrative matters that can have an important impact on judicial decision making.

Regardless of the safeguards built into the law or the constitution to protect judicial independence, those wishing to influence judicial decisions outside of the regular courtroom process will attempt to find ways to interfere with judicial independence. Therefore, procedures designed to protect judicial independence need to evolve in order to meet new threats and challenges. Enhancing the protection mechanisms for judicial independence, however, needs to proceed cautiously, lest judicial independence is allowed to encroach on the rightful domains of executive and legislative independence. For example, when judges decree that judicial compensation commissions are constitutionally required to protect judicial independence, have they overstepped the boundaries of judicial independence? More generally, an activist judiciary that imprudently strikes down legislation on constitutional grounds puts judicial independence at risk.

All liberal democracies struggle with the question of the degree to which courts should control their own administrative apparatus in order to promote judicial independence. This issue is particularly important in jurisdictions like the United States that adhere to a strict separation of powers doctrine.^[18] On the one hand, administration—including courts administration—is arguably the responsibility of the executive branch. On the other, executive administration of the courts can be abused so as to endanger judicial independence. However, courts that control their own administration machinery always encounter judicial independence concerns when dealing with budgetary and labor relations issues. As with many administrative conundrums, there are no perfect solutions, and intra-state and international comparisons of attempted resolutions of these issues is always enlightening.

Judicial Selection and Merit Selection

Cole Blease Graham Jr.

*Department of Government and International Studies, University of South Carolina,
Columbia, South Carolina, U.S.A.*

INTRODUCTION

Based on the principle of dual sovereignty, there are parallel court systems in America—one for the federal or national system and one for each of the 50 states. Generally, these courts are at three levels—an entry level called circuit or district, an intermediate or appeals level, and a final or supreme court. Complementing these general civil and criminal and review courts are specialty courts, such as a regulatory agency court or a court that deals with a single problem such as bankruptcy, as well as courts of lesser or preliminary jurisdiction such as magistrates.

The United States Constitution establishes the process through which the President and Senate select judges for the United States Supreme Court. Congress initiates legislation to create and design all other federal courts. Similarly, individual state constitutions define each state's court system and the roles of the executive and legislative branches or local governments in selecting judges. Reformers have advocated a merit plan for judicial selection to replace the more traditional electoral processes within the states. A merit plan is based on more defined criteria for the qualifications of a judge.

OVERVIEW

When thinking about courts, it is easy to focus on the prominence of the persons or parties on trial and to overlook the fact that courts are really managed by lawyers who are guided by judges. Lawyers have to be guided through court proceedings by judges to create a written record which is respected by other lawyers and by higher courts. A judge must have a sufficient legal background to direct the operation of a court credibly. The American Bar Association (ABA), long an advocate of merit selection, has proposed professional qualifications instead of political party membership as the preferred basis for judicial selection. In addition, the ABA argues that judges should have solid personal attributes such as “superior self-discipline” and “moral courage.”^[1] The ABA also promotes standards for evaluating the performance of a sitting judge

for any needed disciplinary measures and the development of continuing education programs.

MERIT CONCEPT

The merit concept is applied more vigorously in countries where the judiciary is treated as a separate, civil service profession.^[2] In such instances, judges are selected by higher entry qualification standards, such as exceptionally high student grades, success in special examinations, and completion of additional training requirements. A judge's career moves up to more demanding jurisdiction and responsibility based on positive evaluations by higher-level justices rather than by elections or executive appointment. One exception in a civil service system for judges is a constitutional court to which a Parliament may elect some proportion of the judges, even then usually from among already qualified judges and for a limited term.

JUDICIAL SELECTION

Judges in the American federal system are appointed by the President and confirmed by the Senate. The advice and consent clause of the United States Constitution has the intent of promoting an independent, highly professionalized federal judiciary without advancing a specific political ideology or political party. It is nonetheless a highly politicized process.^[3,4] Except for Supreme Court justices, the senior Senator of the President's party from the state in which the vacancy occurs or a new judgeship is created typically controls the appointment. Most federal judges have been members of the same political party as the President who nominated them.

Before confirmation by the Senate, a presidential nomination is reviewed by the Senate Judiciary Committee. The committee will not act until it has received the ABA report on each nominee, a tradition that began in the mid-twentieth century. Each potential nominee gets a questionnaire and returns it in 3 to 4 weeks. The ABA committee evaluates integrity, competence, and judicial temperament and rates each as

“well qualified,” “qualified,” and “not qualified.” In March, 2001, the George W. Bush administration discontinued reliance on the ABA report before announcing its nominations and, instead, decided to rely on the advice of the Federalist Society.^[5]

The political reputation of a judicial nominee often predetermines the outcome of the selection process. Lately, a “blue-slip” policy has emerged in which an individual senator, often, but not always from the home state of a nominee, may veto confirmation.^[6] This practice stalls confirmation of judicial nominees. Critics fear that the integrity of federal courts is threatened by a growing number of judicial vacancies, delays in filling them, and a decrease in legislative respect that may lead to mediocre compromise selections and reduced performance.

States use five approaches to judicial selection: popular election by party (partisan); election without regard for party (non-partisan); legislative election; merit selection; and gubernatorial appointment.^[7] Following the “common man” ideals of Jacksonian democracy that promote the qualifications of the ordinary citizen for government positions, 39 states elect state supreme court justices, and many also elect appeals court judges. Election advocates believe voters should express their preference, and that the ballot box is the best means to select a qualified judiciary.

Judicial candidates in partisan contests must finance their campaigns, make speeches at political rallies, and take positions on issues just like other candidates. Often, campaigns become heated, and candidates are negatively attacked for previous actions as a lawyer or prosecutor, such as defending a drug dealer, or for decisions in previous experience as a judge that may be portrayed as too soft on crime. The ABA Code of Judicial Conduct discourages aggressive partisanship by recommending against discussion of legal issues in partisan campaigns. Challenges by judicial candidates to the ABA ban or other ethical restrictions are often sustained on a First Amendment right to free speech argument.

In June, 2002, the Supreme Court of the United States struck down a canon of judicial conduct adopted by the Minnesota Supreme Court to bar candidates for judicial offices from publicly stating their views on controversial legal or political issues. The nation’s highest court cited two reasons for its action. First, it found that the challenged canon violated the First Amendment of the U.S. Constitution, which protects the content of speech. Second, it decided that this canon infringed upon a category of speech protected by this amendment; namely, the right of judicial candidates to express publicly their qualifications for such offices [*Republican Party of Minnesota v. White*, 536 U.S. (2002)].

Non-partisan elections select candidates without party identification or the participation of a political

party in an effort to reduce negative politics or party influence. It is arguable that non-partisan elections do not achieve the ideals of reformers for an independent judiciary when compared to elections based on party.^[8] Both approaches to popular election of judges are criticized for low rates of voter participation, increased costs of campaigning, and the tendency of incumbents to be reelected continuously. Where judges are elected on a less-than-statewide basis, for example, a state circuit or district judge, the Voting Rights Act of 1965 has been increasingly applied by federal officials to the electoral process if racial discrimination may be present.

Reform of popular election of judges has focused significantly on campaign finance. In February, 2002, the ABA recommended public financing for judicial elections as a way to reduce the fund-raising burden on candidates, the potential influence of contributors, and suspicious criticism of the fairness of courts. Although 14 states provide some level of public financing, recent campaigns have become more expensive and more combative. In a study initiated by merit system appointment advocates, it was found that spending in state supreme court elections doubled from 1994 to 1998 and increased another 60+ % in 2000 to total over \$45 million.^[9]

Among opponents of public financing are business interests which may be adversely affected by court decisions. Some interest groups issue reports on candidates as a way to influence voter decisions. In 2002, the United States Chamber of Commerce and the Business Roundtable launched an effort—the Litigation Fairness Campaign—to raise and direct campaign financing to influence judicial elections in states where previous outcomes in tort litigation in business liability has hurt the business community.

Legislative election remains in only two states—South Carolina and Virginia—where a majority vote of legislators selects a judge. These two former English colonies perhaps continue the tradition of legislative action to offset the potential impact of executive appointment authority or the fear of popular elections. A recent reform is the addition of a preview panel to recommend the qualifications of candidates rather than have candidates appeal directly to the legislature. Legislative voting outcomes show an overwhelming tendency to elect candidates who have previously served in the legislature. Opponents of this approach to selection argue that serving as a judge is very different from legislative service, and that public accountability is reduced by insider pressures for legislative conformity.

About half the American states use a merit selection plan. The typical plan is called the Missouri Plan after the state that first adopted the ABA reform recommendations. It typically involves four steps. First, a

nominating commission composed of judges, bar association representatives, and citizens is established. It is typically non-partisan or attempts to represent both parties equally. Second, the nominating commission generates a list of candidates, conducts hearings or investigations on them, picks three names from the long list, and forwards the names with accompanying information to the governor. Third, the governor appoints one to the judgeship. Fourth, at the next general election, the governor's appointee is confirmed for a full term or rejected.

Some variations occur within the states, as the elements of a Missouri merit selection plan are combined differently. For example, in California, the governor goes first by sending a nomination to a commission on judicial appointments made up of the Chief Justice, an appellate judge, and the Attorney General. If the commission approves, a candidate takes office until the next general election, at which time, the candidate is voted on for a 12-year term. New Mexico features nomination by a commission and appointment by the governor. But, for a full term, the nominee must run in the next general election on a partisan basis and in the subsequent general election on a non-partisan basis.

Gubernatorial appointment as an exclusive process for judicial selection is used in five states. It is an example of checks and balances between two branches of government. The popularly elected executive reflects the will of the people in designating judges who then act independently of the executive. Critics inject that there may be more politics than meets the eye, because a governor's selection may reflect political considerations more than judicial qualifications. The potential for executive political influence is expanded even more, because governors often appoint individuals to fill vacancies before elections or a merit system commission can act, thus giving a specific candidate the benefit of incumbency.

CONCLUSION

The President and the U.S. Senate have played key roles in judicial selection in federal courts during the more than 200-year history of the nation. Recently,

political controversies, often sharply divisive, have made this process more contentious and delayed filling some vacancies. Presidential nominations have become less reliant on the influential role of the ABA. Senatorial advice and consent decisions have diminished senatorial courtesy by giving greater leeway to an individual Senator's ability to veto a presidential nomination.

About half the American states select judges based on merit principles of professionalism as a way to soften what may be called the unnecessary politicization of the courts through campaigns and elections. Advocates of judicial elections maintain that political campaigns give voters substantive choices and enhance the accountability of judicial performance. Many states now include campaign finance reform as a way to orient popular judicial elections toward merit selection concerns.

Just War

Cyrus Ernesto Zirakzadeh

Department of Political Science, University of Connecticut, Storrs, Connecticut, U.S.A.

INTRODUCTION

Proponents of just war argue that disinterested principles of universal justice should motivate and inform a government's deliberations about whether and when to combat a foreign power. Moral principles should trump preoccupations with international power, prestige, money, or security. Just-war theorists therefore seek to clarify both: 1) the circumstances under which states are morally justified in going to war; and 2) the amounts and forms of violence that, once the battles commence, are morally acceptable.

RIVAL APPROACHES TO MORAL REASONING IN INTERNATIONAL RELATIONS

Because the concept of a just war presumes that moral ideals and standards should play a key role in foreign-policy making, this style of political thinking diverges from so-called "realist" schools of thought, which maintain that moral concepts are (or ought to be) irrelevant to foreign-policy making. Realists believe that state leaders should eschew moral ideas and analyze foreign-policy questions primarily in terms of national self-interest.

Historians of political thought, such as Brian Orend and Jack Donnelly,^[1] have noticed that realist arguments against the concept of just war can take two basic forms. One, often called "descriptive realism," contends that states, whenever they make policies about foreign relations, are always motivated first and foremost by considerations of power, security, and national interest. According to descriptive realists, such as Hans Morgenthau and Karl von Clausewitz, proponents of just war naïvely think that government leaders can abide by moral principles; but this cannot happen for numerous reasons, including the pressures on the state to survive in a hostile and anarchic international environment. A second realist position, sometimes called "prescriptive realism," can be found in the work of Henry Kissinger and George Kennan. A typical prescriptive realist concedes that moral visions sometimes inform government leaders' decisions about war and peace, but this practice is both politically and ethically undesirable. Moral ardor (according to the prescriptive-realist argument) tends to foster bloody

crusades, in which self-righteousness blinds antagonists to possible truces and peaceful solutions. Calm calculations of enlightened self-interest, on the other hand, are more likely to guide state leaders along peaceful paths.

Many contemporary proponents of just war, including Michael Walzer,^[2] find all realists' arguments unconvincing. Historical events, such as the United States' decision to enter World War I, demonstrate that, despite the claims of descriptive realists, moral principles sometimes guide states' decisions about war and peace. The prescriptive-realist argument likewise rests on empirical overgeneralizations (or so just-war theorists contend). True, moral principles sometimes inspire crusades and thus contribute to international havoc; but sometimes, moral reasoning is sober and moderate, especially if the moral system places a premium on tolerance, cooperation, and peace (as the world's major ethical systems do). In other words, the content of a moral vision, and not moral reasoning per se, fosters either war or peace.

In addition, some writers who are sympathetic to just-war theory, such as Orend,^[1a] argue that the unrestrained pursuit of self-interest, untethered to moral principles, may contribute greater havoc to international politics than do moral principles. After all, national self-interest can justify colonialism, imperialism, genocide, and other blatantly unjust political arrangements that in the long run fuel wars. Without moral ballast, national egoism is dangerous (or so just-war theorists maintain).

Besides diverging from realist thought, just-war theorizing differs from several relatively popular ethical approaches to warfare that students of the history of political thought, such as Inis Claude, James Sterba, and Jennifer Teichman,^[3] sometimes call pacifism, militarism, and Christian realism. Twentieth-century pacifists—perhaps the most famous being Gandhi—believe that war is never morally permissible and fear that the concept of a just war provides a convenient cover for large-scale murder. Meanwhile, modern militarists, such as Theodore Roosevelt, have condoned warfare partly because combat both ennobles participants and contributes to the evolution of humanity by eliminating less vibrant people and cultures.^[4] According to this neo-Darwinist line of reasoning, war prevents the human species from stagnating, and just-war theorists,

underestimating the benefits of warfare, are wedded to overly soft-hearted and even effeminate notions of morality. War, in fact, hones important virtues and values, such as discipline and self-sacrifice for the good of the group. Finally, some Christian theologians with a deep commitment to love as a value, such as Reinhold Niebuhr, contend that the concept of a just war is a puzzling, incomplete, and muddled moral position that unsuccessfully blends pacifist and militarist thinking.^[5] For the Christian realist, what is crucial is that just war be reluctantly undertaken to promote peace, and with a spirit of dread about the use of violence, and forgiveness toward one's enemies.

Compared to pacifists, militarists, and advocates of Christian love and mercy, theorists of just war over the centuries have developed a unique moral position. Like pacifists, just-war theorists contend that intentional and large-scale killing is abhorrent and should be avoided. Yet, like militarists and Christian realists, just-war theorists insist that wars sometimes eliminate, or at least contain, significant evils. Therefore (argue the just-war theorists), war can be morally justifiable—despite the large-scale violence and suffering that is entailed—if it is undertaken for morally correct objectives, if it is undertaken with morally correct military methods, and if it ends in a morally appropriate fashion that promotes peace.

EVOLUTION OF JUST-WAR ARGUMENTS

The idea that governments should consider ideas of justice when deploying their armies is more than two millennia old. According to Thucydides,^[6] during the Peloponnesian War, the ancient Athenians exchanged opinions about justice in their assemblies and balanced moral and nonmoral concerns as they debated whether to go to war, whom to fight, and whether to accept peace proposals. To rally support for or against particular courses of action, speakers asked the gatherings whether a proposed military action—for instance, the invasion of a distant country or the execution of defeated enemies—was just. In the ensuing debate, different and sometimes divergent arguments about justice were aired. In the name of justice, some citizens counseled mercy and restraint, while others demanded violent retribution for past offenses and deserved deference from other peoples.

After Rome eclipsed the Greek city-state, discussions about the relationship between justice and warfare evolved in new directions. Church leaders, such as Origen and Lactantius, derived their understanding of justice from sacred text and initially argued that passages in the New Testament—such as Jesus' declarations to turn the other cheek and to love thy enemy—prescribed pacifism. Once Rome adopted

Christianity as its official religion, pacifism became more difficult to defend. The Roman Empire, after all, afforded Christians the modicum of social peace necessary to practice their religion in safety, and many enemies of Rome committed atrocities against the faithful.

Breaking decisively with the Church's initial pacifist position, St. Augustine articulated several themes and arguments that have informed just-war thinking for many centuries.^[7] Augustine argued that Jesus' precepts apply primarily to matters of one's heart. In the privacy of one's heart and home, a true Christian should, of course, unswervingly desire peace and wish to serve others. A Christian, nonetheless, sometimes must physically battle sinful rulers and foreign governments that threaten social peace and that make it difficult, if not impossible, for a Christian to live according to the commandments of the heart. Augustine hastened to add that his just-war doctrine did not mean that all of Rome's wars were justifiable. A government's systematic use of violence against another government is moral only if the ruler's heart is genuinely motivated by love of peace and social order, and not by earthly desires for fame, power, or material goods.

Augustine further argued that only political leaders are entitled to judge whether a war is morally justifiable. If every soldier and subject makes his or her own decision about the morality of a war, chaos might result, which violates the Christian goal of peace. Augustine also insisted that any ruler who is contemplating launching a just war must first explore methods short of armed conflict—such as diplomatic agreements—that might change the behavior of potential enemies. In addition, a declaration of war is just only if the ruler believes that the chances for success are high and that the anticipated amount of violence and suffering in the war will not exceed the expected benefits of victory. Finally, once the war commences, soldiers who are fighting on the side of justice must eschew morally heinous methods. Cruelty and bloodshed should never exceed the minimum needed to prevent future evil behavior on the part of the opponent. Augustine specified that soldiers must refrain from abusing captives. Torture, in particular, is strictly prohibited.

In the centuries following Augustine's death, the idea of a just war gradually became more secular, and proponents of just war increasingly based their moral reasoning not on sacred text but on the self-evident dignity of every human being. Thomas More's *Utopia* (1516), written at the height of the Renaissance, illustrates the newer, humanist views on just wars.

Utopia opens with Hythlodæus, a mysterious traveler, denouncing war in Europe because it is undertaken solely to enrich royal courts. Hythlodæus later

describes the military practices of a fictitious island called Utopia, whose citizens are morally upright despite the fact that they view Christianity as merely one of several beneficial theological systems. According to Hythlodæus, Utopians, believing in the equal and inherent dignity of every citizen, refrain from violence on their own island. Yet they are not pacifists. They go to war for three reasons: to protect their own island from imminent invasion, to aid allies who suffer injustices from intemperate foreign powers, and to rescue innocent persons and communities from arbitrary persecution and tyranny. Even when these conditions exist, the Utopians reluctantly go to war because of the suffering and pain that it entails. War is “an activity fit for beasts . . . they regard it with utter loathing.”^[8] Before taking up arms, the Utopians first try to influence foreign powers through diplomacy, economic incentives, and other non-violent methods. If these methods fail, then the Utopians go to war.

Wishing to fight in a just manner, Utopians avoid large battles and instead try to ambush the opposing army’s commanders. To win with as little bloodshed as possible, Utopian forces refuse to trample upon the crops of any country that they invade, preserve all cities, and respect all private property (except that owned by spies). The soldiers do so in the hopes that by leaving economic arrangements intact, they will drive a wedge between their enemy’s subjects and rulers. Once the hostilities end, the Utopians execute all enemy office holders who, until recently, steadfastly refused surrender and enslave all enemy soldiers who remained loyal to the regime. A detachment of Utopian officials then remains in the territory to observe local affairs and ward off future warlike behavior. To finance this detachment, to defray the costs of the recently completed war, and to finance future wars, the Utopians seize and manage a portion of the properties owned by the killed enemy officials and enslaved soldiers. Other confiscated property is transferred to those citizens within the enemy state who had courageously rebelled against their rulers.

During the 18th century (the age of the U.S. and French revolutions), the notion of a just war evolved in new directions and became associated with the spread of political rights. So-called “enlightenment” writers, such as William Godwin and Johann Herder, desired peace, but they also wished to reform the world. They therefore argued that a war was morally just if it spread liberal institutions and constitutional practices—such as private commercial property, voting rights for the middle classes, and the republican separation of the executive and legislative branches of government—to unenlightened nations.

Immanuel Kant, for instance, denounced war as “the greatest source of the evils which oppress civilized nations” in his essay on the origins of human

history,^[9] and yet insisted that warfare contributes to human progress by forcing despots to grant economic, cultural, and political freedoms to middle-class citizens. Kant further argued in a pamphlet about perpetual peace that to make the world safe for independent citizens, it may be necessary to create a worldwide military alliance of freedom-oriented states.^[10] In theory, each state in the alliance would refrain from attacking the others and would go to war for two reasons only: to protect its own borders from imminent attack, and to protect the liberties of self-directing citizens in other countries. Whenever the armies of the alliance defeat an enemy, the constitution of the vanquished country should be remade so that “every state shall be republican.”^[11] Kant, however, doubted that an international alliance would form in the foreseeable future (because current government leaders are insufficiently enlightened to curb their short-term appetites for territorial expansion and to subject themselves to an international alliance). So he proposed that for now, leaders of all constitutionally liberal states consult their citizens before each and every declaration of war because state leaders, seeking glory and gain, will naturally rush into battles. Citizens, on the other hand, understand the costs of war and will support it only when external threats to freedom are palpable and significant.

During the 20th century, just-war theory changed once more. Michael Walzer, arguably the most influential just-war scholar of the late 20th century, redefined justice in terms of the protection and promotion of individuals’ “rights to life and liberty,” including property.^[12] He argued that such human rights are now recognized worldwide and are beyond serious debate. Walzer also extended his understanding of rights to states, because without a government to provide for social security and stability, individuals would be unable to enjoy their rights to life and liberty.

According to Walzer, in an ideal world, all states would refrain from war, and individuals would be free to conduct domestic affairs as they wish, provided that they do not violate the life and liberty of fellow citizens. In the real world, however, some individuals attack the life and liberties of other citizens (hence, the moral need for the state), and some states oppress their citizens and invade and sack other states (hence, the moral need for just wars). A just war is one undertaken by a state first and foremost to protect, preserve, and restore individuals’ rights to life and liberty.

Drawing on earlier just-war theorizing, Walzer contended that a state is obligated to explore non-military methods of changing the behavior of a rogue state, to consider whether victory will significantly protect or restore of human rights, and to calculate the anticipated costs of a war against the evil that is to

be eliminated. If non-military options prove ineffective, if the likelihood of protecting or restoring individuals' rights appears high, and if the anticipated costs of war appear comparatively low, then a declaration of war is morally justified. Walzer also adopted the proviso, extending back to the writings of Augustine, that a just war must be conducted properly. Non-combatants should never be military targets, except under conditions of military exigency. Rape and pillage are prohibited.

JUST WAR IN PUBLIC POLICY

Since the mid-19th century, various Christian and secular theories of just war have influenced the course of international law and organization.^[13] The 1928 Kellogg-Briand Pact, for example, explicitly condemned war as an instrument of national policy, except for purposes of self-defense. Since 1864, numerous Geneva accords have attempted to control the brutality of war by prohibiting states from using biological and chemical weapons, from torturing prisoners, from intentionally attacking civilian targets, and from fielding soldiers under 15 years of age. The Red Cross, in particular, has played a key role in drafting and enforcing the pacts. Meanwhile, countries belonging to the United Nations have pledged to each other to desist from wars of aggression and to declare wars only to prevent humanitarian catastrophes, such as genocide, or to protect their citizens and borders from imminent attack.

The translation of just war from a moral theory into a set of practical policies has revealed vexing questions about the idea, which so far have received no satisfactory solutions.

First, should leaders of states be the only ones entitled to decide whether a war is morally justified? Or should an international body be given that authority? Walzer has endorsed the first, state-centered position, partly because he believes that groups with shallow moral commitments often manipulate international bodies. Kant, however, viewed state leaders as unreliable; he therefore recommended an international alliance as well as citizen consultations in all republics on the justness of contemplated wars.

Second, exactly which immoral situations, short of actual invasion, justify military actions? Does the refusal of a wealthy country to share its riches with an impoverished country, whose natural resources have been exploited by members of the wealthy country, provide grounds for military action to procure badly needed food? What about acts of genocide—such as the extermination of members of an ethnic minority—or gross human-rights violations—say, widespread use of torture—by an authoritarian regime?

Walzer, for one, has tended to describe genocide and severe and systematic civil-rights violations as sufficient reason to go to war, but has been wary about extending just-war arguments about human rights violations to economic exploitation and cultural discrimination. Still, the question remains open. Orend and Thomas Pogge,^[14] among others, believe that just-war reasoning may be relevant when state leaders contemplate responses to either wealthy countries' refusal to share wealth with less fortunate members of humankind or the systematic destruction of indigenous and minorities' cultures.

Third, once flagrant acts of injustice by a state have been legitimately identified, who exactly is entitled to go to war? Does every nation state have the right to unleash its own forces according to its leaders' own independent judgment? Must international sanction first be secured, and if so, how? Or should the military force in a just war always be broadly international to begin with, and not under the direction of a particular country or state?

Fourth, does the notion of the just conduct of a war make sense in an age of weapons of mass destruction? Should the use of landmines and aerial bombings (not to mention nuclear, chemical, and biological weapons) that indiscriminately hurt soldiers and civilian populations be judged a war crime? Can countries today refine their use of military technology (including nuclear weapons) so as to avoid needless civilian deaths, as James Turner Johnson recommends?^[15] Or, as Philip Acton suggests,^[16] does modern military technology make just-war arguments about sparing non-combatants outdated?

Finally, to ensure a lasting peace, does engagement in a just war require long-term occupation and extensive reconstruction of societies and culture? Is the notion of just war, as Kant suggested, inextricably linked to the difficult process of regime building?

CONCLUSIONS

As we have seen, the idea of just war has metamorphosed considerably over two millennia. This suggests that the idea is capable of further adaptation and variation. When put into practice, the concept raises difficult questions about authority (who is to determine whether a particular declaration of war is justified?), about ethical standards (does "justice" refer to the protection and promotion of Christian peace, to human rights, to republican constitutional arrangements, or to something else?), and about the indiscriminant destructiveness of modern weaponry. As proponents of just war wrestle with these practical problems, theories about the relevance of ethics to war undoubtedly will evolve in new directions.

Justice through Emancipation: Abraham Lincoln as a Model of Justice

Frank J. Williams

Rhode Island Supreme Court, Providence, Rhode Island, U.S.A.

INTRODUCTION

The statue of Lady Justice, in her various forms, is the modern symbol of justice. Typically blindfolded, she holds a scale in one hand, while the other holds a sword. Statuettes or portraits of Lady Justice are a fixture in courthouses throughout the U.S.A. today, ostensibly because of the virtues she represents.

This article discusses Abraham Lincoln's moral objection to slavery, the issuance of the Emancipation Proclamation, and his role in the passage of the Thirteenth Amendment. His actions combined to create an historical model of justice. In the Proclamation itself, Lincoln maintained it was "an act of justice," and it has come to personify a human rights model of justice.

LINCOLN'S MORAL OBJECTION TO SLAVERY

An understanding of Lincoln's moral objection to slavery is fundamental to any discussion of the Emancipation Proclamation. Lincoln flatly opposed the "institution" by trumpeting the principles of natural law, which broadly called for the infusion of moral principles into government and law. In the political arena, he fought vigorously against the extension of slavery into the western territories.

As early as 1837—some 22 years before he was elected President—Lincoln maintained "[t]he institution of slavery is founded on both injustice and bad policy."^[1] Lincoln believed simply that slavery was wrong and that "like every other wrong which some men commit if left alone, it ought to be prohibited by law."^[2]

He formally built his case against slavery during the course of his campaign in 1858 against Stephen A. Douglas for the US Senate, campaigning on the following moral ground while directly attacking Douglas's advocacy of "popular sovereignty:"

When [Douglas] invites any people willing to have slavery, to establish it, he is blowing out the moral lights around us. When he says that he "cares not whether slavery is voted down or voted up,"—that

it is a sacred right of self-government—he is in my judgment penetrating the human soul and eradicating the light of reason and the love of liberty in this American people.^[3]

Lincoln, quoting his own 1854 printed speech, continued in this vein during the first of their famous debates:

This declared indifference, but as I must think, covert real zeal for the spread of slavery, I cannot but hate. I hate it because of the monstrous injustice of slavery itself. I hate it because it deprives our republican example of its just influence in the world—enables the enemies of free institutions, to taunt us as hypocrites—causes the real friends of freedom to doubt our sincerity, and especially because it forces so many good men amongst ourselves into an open war with the very fundamental principles of civil liberty—criticizing the Declaration of Independence, and insisting that there is no right principle of action but self-interest.^[4]

His courageous stance on the hot button issue of the day was far from politically expedient; he eventually lost that election.

To be sure, Lincoln's stance on slavery was not without its flaws when measured by modern standards. For much of his political life, Lincoln had advanced the concept of colonization, which would have allowed freed slaves to return to Africa. Colonization, as a political solution to the problems presented by emancipation, appealed to him—as it did to his political hero, Henry Clay—because of the "moral fitness in the idea of returning to Africa her children, whose ancestors have been torn away from her by the ruthless hand of fraud and violence."^[5] His support for *voluntary* colonization diminished during his presidency; he said nothing about it publicly after the issuance of the Emancipation Proclamation.

Lincoln's opposition to slavery, however, never waned. As President, Lincoln wrote in a letter to former US Senator Albert G. Hodges of Kentucky: "I am naturally anti-slavery. If slavery is not wrong, nothing is wrong. I can not [sic] remember when I did not so think, and feel."^[6] To the end, Lincoln steadfastly illuminated the moral light through his opposition to slavery.

CONSTITUTIONAL IMPEDIMENTS

The US Constitution conflicted with Lincoln's strong moral beliefs, namely its so-called three-fifths clause. Addressing how taxation and membership of the House of Representatives would be apportioned, it included the phrase "three-fifths of all other Persons." At the very least, this provision recognized slavery as an institution and the reality that the slaves were in some respect human and, in another respect, mere property.

During the seventh debate with Douglas, Lincoln suggested a way to reconcile the end of slavery with the Constitution:

The real issue in this controversy—the one pressing upon every mind—is the sentiment on the part of one class that looks upon the institution of slavery *as a wrong*, and of another class that *does not* look upon it as a wrong. The sentiment that contemplates the institution of slavery as being wrong, is the sentiment of the Republican party . . . They look upon slavery as a moral, social and political wrong; and while they contemplate it as such, they nevertheless have due regard for its actual existence among us, and the difficulties of getting rid of it in any satisfactory way and to all the constitutional obligations thrown about it. Yet having a due regard for these, they desire to see a policy in regard to it that looks to its not creating anymore danger. They insist that it should as far as may be, *be treated* as a wrong, and one of the methods of treating it as a wrong is to *make provision that it shall grow no larger* . . . I have said, and I repeat it here, that if there be any man amongst us who does not think that the institution of slavery is wrong in any one of the aspects in which I have spoken, he is misplaced, and ought not to be with us. And if there is a man amongst us who is so impatient of it as a wrong as to disregard its actual presence among us and the difficulty of getting rid of it suddenly in a satisfactory way, and to disregard the constitutional obligations thrown about it, that man is misplaced if he is on our platform. We disclaim sympathy with him in practical action. He is not placed properly with us.^[7]

The extremes within this quote display Lincoln's political savvy. The first half pays homage to the abolitionists; the second half makes amends for the abolitionists with the South, demanding that those who stand with him take into account, among other factors, the requirements of the Constitution.

The US Supreme Court's infamous Dred Scott decision in 1857 further strengthened the constitutional support for the institution of slavery. Written by Chief Justice Roger Taney, the decision held that blacks were not citizens of the U.S.A. and Congress had no

constitutional power to prohibit slavery in the federal territories.^[8] The opinion went even further and proclaimed that blacks "had no rights which the white man was bound to respect."^[9] Although Lincoln vehemently disagreed with this opinion, he nonetheless recognized the law of the nation when he assumed the presidency in 1860.

Lincoln, however, found support for his antislavery position in the Declaration of Independence. While in Philadelphia on his way to his inauguration in 1860, he reiterated his opposition to slavery and his hope for the preservation of the Union:

It was not the mere separation of the colonies from the mother land; but something in that Declaration giving liberty, not alone to the people of this country but hope to all the world, for all future time. It was that which gave promise that in due time the weights would be lifted from the shoulders of all men, and that all should have an equal chance. This is the sentiment embodied in the Declaration of Independence. Now, my friends, can this country be saved on that basis? If it can, I will consider myself one of the happiest men in the world if I can help to save it. If it cannot be saved upon that principle, it will be truly awful. But, if this country cannot be saved without giving up that principle, I was about to say I would rather be assassinated on this spot than surrender it.^[10]

The distinction Lincoln drew between the Constitution and Declaration of Independence is akin to the primary distinction between law and justice. While law is merely an assemblage of rules that comes to us from the courts or through the enactments of the legislature, justice is based on the integral relationship between people and these rules. When justice is realized, reconsecration of faith in government, community, and the rule of law ensues. The belief that all men are created equal is a basic precept of justice because it resonates universally. That sentiment would become a powerful undercurrent in Lincoln's wartime management of slavery.

THE EMANCIPATION PROCLAMATION

Lincoln's primary objective during his presidency was the preservation of the Union by quelling the rebellion of the southern states. As evidenced by Lady Justice's balancing and weighing of interests, justice is a perpetual search for equilibrium. Lincoln, as President of the U.S.A. in a time of civil war, was in the unique position of determining the point at which it could be established. Ever the resourceful politician-lawyer, he was able to strike at slavery to win the war.

At the outset of his presidency, Lincoln was careful to draw a distinction between his own values and his obligations under the Constitution:

I am naturally anti-slavery. If slavery is not wrong, nothing is wrong. I cannot remember when I did not think so, and feel. And yet I have never understood that the Presidency conferred upon me an unrestricted right to act officially upon the judgment and feeling. It was in the oath I took that I would, to the best of my ability, preserve, protect, and defend the Constitution of the United States. I could not take the office without taking the oath. Nor was it my view that I might take an oath to get power and break the oath in using the power. I understood, too, that an ordinary civil administration this oath even forbade me to practically indulge any primary abstract judgment on the moral question of slavery.^[6]

Lincoln, therefore, came slowly to the idea of emancipating slaves by executive order. For example, his annual message to Congress in 1862 suggested an amendment to the Constitution that would end slavery gradually by 1900. By mid-summer 1862, however, Lincoln was discussing openly with several of his cabinet members the emancipation of slaves. In the middle of the war, Lincoln became convinced he could pursue the goals of emancipation and preservation of the Union simultaneously through the exercise of his presidential powers during wartime.

The Emancipation Proclamation had two manifestations. The preliminary Proclamation on September 22, 1862, declared that the slaves in areas still in rebellion against the U.S.A. on January 1, 1863, 100 days hence, would be then and forever free. It also directed the military not to enforce the fugitive slave laws that required their return.

On January 1, 1863, Abraham Lincoln signed the final Emancipation Proclamation (Appendix). It freed “henceforth and forever” slaves “within any state or designated part of a State whose people . . . shall then be in rebellion against the United States.” Lincoln based the authority of his proclamation on his power as the Commander-in-Chief and specifically termed the measure “a fit and necessary war measure” to suppress the rebellion. He termed it “an act of justice.”

The Emancipation Proclamation demonstrates Lincoln’s concentric grasp of legal and political issues. The Constitution authorized the Congress or the President to confiscate property only with proper compensation. When the preliminary Emancipation Proclamation was issued, the legal basis of the action seemed obscure. When the time came for the final Emancipation Proclamation on January 1, 1863, Lincoln determined that his act was a war measure taken as Commander-in-Chief to weaken the enemy. Thus,

justification for emancipation rested on the war power. His interpretation of the law of war was correct. According to Henry Wheaton’s contemporary treatise on international law, “[f]rom the moment one State is at war with another, it has, on general principles, a right to seize on all the enemy’s property, of whatsoever kind and wheresoever found, and to appropriate the property thus taken to its own use, or to that of the captors.”^[11]

In his final Emancipation Proclamation, Lincoln expressly exempted parts of the South by mentioning particular states and parts of states that were already under the control of the Union army. Always mindful of the constitutional limits on his own power, Lincoln believed his power to wage war did not extend into regions of the former Confederacy that were already in the process of returning to the Union, despite the fact that slavery was still an acceptable institution in those regions. In hindsight, emancipating only the slaves in certain areas may seem like an unacceptable compromise that falls short of the justice of complete emancipation. A modern-day author defines “immoral justice” as “a resolution that makes sense legally and can be justified by judges, lawyers, and law professors simply by conforming, in a very narrow formalistic sense, to precedent and procedure, but ultimately feels emotionally wrong to everyone else.”^[12] The shortcomings of the Emancipation Proclamation, however, would prove to be temporary.

THE THIRTEENTH AMENDMENT

Although the Thirteenth Amendment, stating that “[n]either slavery nor involuntary servitude, except as a punishment for crime . . . shall exist within the United States,” did not become law until after his death, Lincoln also was instrumental in amending the Constitution and abolishing slavery in its entirety. Understanding that the Emancipation Proclamation was a wartime measure, he sought a more permanent determination that would end slavery throughout the country. Even before his 1864 reelection, Lincoln was the amendment’s foremost ally and “[n]o piece of legislation during Lincoln’s presidency received more of his attention than the Thirteenth Amendment.”^[13] Although some have argued that his means may have been dubious, he deserves recognition and praise: “Whereas other political leaders of his day, both home and abroad, fixated only on Machiavellian means and ends, Lincoln practiced the pure art of politics within acceptable *moral bounds*.”^[14] As the next logical step after the Emancipation Proclamation, Lincoln refused to accept the wartime solution of limited emancipation and ultimately achieved the morally just result in the Thirteenth Amendment. In doing so, he solidified his place in American history as the Great Emancipator.

CONCLUSIONS

Secondary to the Declaration of Independence, the Emancipation Proclamation is the most significant statement of moral policy issued by the US government in its history. After nearly two years of armed rebellion, President Abraham Lincoln proclaimed on January 1, 1863 that the slaves in eight of those states, and in large portions of two others, were free people and that the US government and its armed forces would protect their freedom. Despite its enormous significance, the document's legalese, written as a war measure by the Commander-in-Chief to survive potential challenges in court, could not conceal the deeper meaning and purpose of the Emancipation Proclamation—the end of American slavery. The emancipation of slaves and the ultimate abolition of slavery nationwide became the just result.

It is not only the ends, but also the means in the issuance of the proclamation that provide the Lincoln model of justice. Despite his strong moral beliefs, he recognized the constitutional recognition of slavery and only acted in the scope of his wartime power in an effort to quell the rebellion and preserve the Union. He resisted the temptation to act beyond his constitutional powers and free all slaves throughout the nation. Although he would not live to see it, he ardently supported the Thirteenth Amendment and ensured Congressional support for it. In this sense, Lincoln embodies blind justice. He weighs the impact of emancipation on the effort to preserve the Union in one hand—while holding the sword of presidential power in wartime in the other. As a justified and necessary military action, Lincoln's Emancipation Proclamation is one of the single greatest acts of justice in American history.

But Lincoln is more than just the Great Emancipator. He embodies many other virtues that exemplify the foundations of American democracy: commitment, character, leadership, integrity, and accountability. Beyond these virtues, however, Lincoln's efforts to end the rampant injustice of slavery make him the single greatest historical figure of American justice.

The author would like to thank Professor William D. Pederson and Kyle Zambarano, Esq., for their thoughtful contributions.

APPENDIX

By the President of the United States of America:

A PROCLAMATION.

Whereas, on the twenty-second day of September, in the year of our Lord one thousand eight hundred and

sixty-two, a proclamation was issued by the President of the United States, containing, among other things, the following, to wit:

“That on the first day of January, in the year of our Lord one thousand eight hundred and sixty-three, all persons held as slaves within any State or designated part of a State, the people whereof shall then be in rebellion against the United States, shall be then, thenceforward, and forever free; and the Executive Government of the United States, including the military and naval authority thereof, will recognize and maintain the freedom of such persons, and will do no act or acts to repress such persons, or any of them, in any efforts they may make for their actual freedom.

“That the Executive will, on the first day of January aforesaid, by proclamation, designate the States, and parts of States, if any, in which the people thereof, respectively, shall then be in rebellion against the United States; and the fact that any State, or the people thereof, shall on that day be, in good faith, represented in the Congress of the United States by members chosen thereto at elections wherein a majority of the qualified voters of such State shall have participated, shall, in the absence of strong countervailing testimony, be deemed conclusive evidence that such State, and the people thereof, are not then in rebellion against the United States.”

Now, therefore, I ABRAHAM LINCOLN, President of the United States, by virtue of the power in me vested as Commander-in-Chief, of the Army and Navy of the United States in time of actual armed rebellion against authority and government of the United States, and as a fit and necessary war measure for suppressing said rebellion, do, on this first day of January, in the year of our Lord eighteen hundred and sixty-three, and in accordance with my purpose so to do publicly proclaimed for the full period of one hundred days from the day first above mentioned, order and designate as the States, and parts of States, wherein the people thereof respectively, are this day in rebellion against the United States, the following, to wit [sic]:

Arkansas, Texas, Louisiana, (except the parishes of St. Bernard, Plaquemines, Jefferson, St. John, St. Charles, St. James, Ascension, Assumption, Terre Bonne, Lafourche, St. Mary, St. Martin, and Orleans, including the city of New Orleans) Mississippi, Alabama, Florida, Georgia, South-Carolina, North-Carolina, and Virginia, (except the forty-eight counties designated as West Virginia, and also the counties of Berkely, Accomac, Northampton, Elizabeth-City, York, Princess Ann, and Norfolk, including the cities of Norfolk & Portsmouth); and which excepted parts are for the present, left precisely as if this proclamation were not issued.

And by virtues of the power, and for the purpose aforesaid, I do order and declare that all persons held as slaves within said designated States, and parts of States, are, and henceforward shall be, free; and that the Executive Government of the United States, including the military and naval authorities thereof, will recognize and maintain the freedom of said persons.

And I do hereby enjoin upon the people so declared to be free to abstain from all violence, unless in necessary self-defence; and I recommend to them that, in all cases when allowed, they labor faithfully for reasonable wages.

And I further declare and make known, that such persons of suitable condition, will be received into the armed service of the United States to garrison forts, positions, stations, and other places, and to man vessels of all sorts in said service.

And upon this act, sincerely believed to be an act of justice, warranted by the Constitution, upon military necessity, I invoke the considerate judgment of mankind and the gracious favor of Almighty God.

In witness whereof, I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the City of Washington, this first day of January, in the year of our Lord one thousand eight hundred and [L.S.] sixty-three, and of the Independence of the United States the eighty-seventh.

ABRAHAM LINCOLN.

By the President:
William H. Seward,
Secretary of State.

INTRODUCTION

Stalking by adults has been the focus of public agencies for the past several decades. It was not until recently that the social problem of stalking by children and adolescents has been identified as a significant social issue for clinicians, law enforcement, and policy makers. A phenomenon that garnered significant attention during the late 20th century, stalking is again gathering strength as the focus turns from adults to the behaviors of children and adolescents. As with many other phenomena, it was only after the death of several celebrities that serious research by clinicians and practitioners was undertaken to develop typologies, assessment methods, medical protocols, and legal responses to offenders and victims. But during this time, as has often been the case with criminal justice research, the focus was entirely on adults. It was not until the year 2000 that the first empirical study was conducted that described the characteristics of child and adolescent obsessional followers.^[1] What has occurred since then has been a rise in both the academic and the public attention to this problem. Many of the juvenile issues such as bullying, school violence, and dating violence have led researchers to take a closer look at juvenile stalking.

MEDICAL DEFINITION

Definitions for stalking are often divided into three overlapping categories to include medical, behavioral, and legal. Although there is no medical definition of stalking, the diagnosis that is most closely associated with the behavior is Delusional Disorder, Erotomanic Type as found in the *Diagnostic and Statistical Manual of Mental Disorders 4th Edition Text Revision (DSM-IV-TR)*. To be defined as a delusional disorder by *DSM-IV-TR*, the behavior must be nonbizarre, persist for at least 1 month, never have met criteria for schizophrenia, not include prominent auditory or visual

hallucinations, if present tactile or olfactory hallucinations must be consistent with the delusion, except as related to the delusion psychosocial functioning must be intact, if mood symptoms are present they must be brief relative to the delusion's duration, and the etiology cannot be from substance use or a general medical condition.^[2] The term "bizarre" in this context means that the delusion is implausible, cannot be understood, or has no connection to "ordinary life experiences." The subtype known as erotomanic type refers to delusions in which the person believes someone else is in love with him/her. The other person typically holds a higher status than the one with the delusion and the "love" is frequently "romantic" or "spiritual" rather than sexual. The delusional person may or may not attempt contact. These attempts at contact may lead to the label of "stalking" and result in law enforcement involvement.^[2]

BEHAVIORAL DEFINITIONS

The behavioral definitions associated with stalking offer a dissimilar approach in that they are not based on the analysis of the actions as described in the *DSM-IV-TR*. Meloy and Gothard proposed the term "obsessional follower" as a clinical corollary of "stalker."^[3] In an extensive review of the literature, they found that earlier works used very narrow definitions for the term "stalking." Most of society had connected the word stalking with the various sensationalized cases that had commanded popular media attention. By expanding the definition and including the term obsessional follower, Meloy included individuals who engage in stalking (as per the technical definition) as well as persons who engage in deviant or long-term patterns of threat or harassment directed toward specific individuals.^[4] Others involved in the research of stalking choose to steer away from the word "stalking" because it implies following behaviors. Instead, these researchers chose to identify the

behavior as obsessional harassment. This includes the many other tactics used by individuals such as telephone contact, mail, or other methods of communication as opposed to face-to-face contact.^[5] This definition also includes the repetitive nature of the perpetrators preoccupations as well as the victims' perceptions.

Some researchers use subtypes of stalking to include erotomania (the delusional disorder), the paranoid type of schizophrenia, and personality disorders. In addition to identifying the types of stalkers, researchers have also identified types of victims. Meloy distinguishes between two groups of targets, private and public.^[6] This distinction between victim types is significant in that as public awareness grows, the misconception that stalking is only a problem of the rich and famous can be corrected. For many the definition of stalking had been relegated to include only public figures with other behavioral definitions being applied to private individuals. By attaching the definition of stalking to both groups, researchers as well as policy makers have made significant advances in helping the public understand what behaviors constitute obsessional following.

Cupach and Spitzberg analyzed stalking as an obsessive relational intrusion.^[7] Their research used the definition: "repeated unwanted pursuit and invasion of one's sense of physical or symbolic privacy by another person who desires or presumes an intimate relationship" (on pages 234–235 of Ref.^[7]). A key component of this definition is that the goals of the parties are not mutual. In addition, Cupach and Spitzberg identified grades of relational intrusion by placing the acts along a continuum.^[7] This helped provide a subjective boundary between reasonable and unreasonable intrusion in relationships, which is particularly helpful in applying the definitions to the actions of children and adolescents. Much of the previous research has created significant problems in applying adult statutes to juveniles. Unlike statutes such as murder where the behavior is clearly identifiable, many of the behaviors exhibited by children are "normal" adolescent behaviors. The continuum established by Cupach and Spitzberg helps to differentiate between normal behavior and abnormal or problem behaviors.^[7]

The most recent typology is based on relationship between stalker and victim and context of the stalking. Known as RECON, this typology has four categories and was tested on a sample of 1005 stalkers. It is the largest nonrandom sample of stalkers ever studied.^[8] Although juveniles were included in the sample, the average age was 36 years. This model should be considered for future research in juvenile stalking. This particular model lends itself well to practical application by law enforcement and mental health practitioners (Fig. 1).^[8]

Author(s)	Name	Characteristics
Zona et al (11)	Simple Obsessional	most common type; have some prior relationship with the victim, usually an intimate one; most often occur in the context of domestic violence
	Love Obsessional Stalkers	no existing relationship with the victim; many target celebrities
	Erotomaniac Stalkers	delusionally believe that they are loved by the victim; rarest category
	Individual perpetrators may not precisely fit any single stalker category, and often exhibit characteristics associated with more than one category; it is important to remember that these typologies are merely guides.	
Mullen, Pathé and Purcell (18)	Rejected	pursue ex-intimates, either in the hope of reconciliation, or for vengeance, or out of a mixture of both
	Intimacy Seekers	who stalk someone they believe they love and who they think will reciprocate
	Incompetent Suitors	inappropriately intrude on someone, usually seeking a date or brief sexual encounter
	Resentful	pursue victims to exact revenge for some actual or perceived injury
	Predatory	stalking forms part of sexual offending
Mohandie, et. al (8)	Intimate	most likely to be violent, rarely psychotic, escalate in behaviors,
	Acquaintance	persistent, strong desire to start a relationship, law enforcement and mental health should be involved in response to these offenders
	Public Figure	largest group in sample, these offenders are older, less likely to escalate, least likely to threaten, most had a history of mental illness
	Private Stranger	majority of victims are women, more likely to "just want to communicate," high frequency of mental illness, and are less likely to assault the target.

Fig. 1 Behavioral models of stalking.

LEGAL DEFINITIONS

Legal definitions begin by creating a distinction between behaviors that are simply part of a criminal's desire to obtain opportunity and those behaviors that the concept of stalking truly encompasses. California was the first state to enact legislation establishing stalking as a criminal act. By 1993, 48 states and the federal government had created some form of antistalking legislation.^[9] All states have now enacted legislation making stalking illegal.^[10]

Legal classifications of stalking behavior generally focus on the stalker–victim relationship. Perhaps the most frequently referred to is that of Zona, Sharma, and Lane which is based on their study of 74 cases managed by the Los Angeles police.^[11,12] They classify stalkers into a simple obsessional group, where the stalker and victim had a prior relationship; a love obsessional group, where there was no prior relationship; and an erotomaniac group, where the stalker developed a delusion that the victim was in love with him or her. The simple obsessional group is most common and reported to be the most likely to resort to violence.^[13,14] Celebrity stalkers are usually found in the love obsessional group, a high proportion of who

suffer from psychotic illnesses. Those in the erotomaniac group are usually women, with their victims being older men of higher socioeconomic status.^[15]

Although this classification is useful, it has its limitations. In particular, it largely ignores the offender's motivation. It is also not clear how reliably the last two groups can be distinguished, how well the typology differentiates between persistent courtship and stalking, and whether it has any predictive validity.

Most legal definitions have several elements that must be met in order for an act to be classified as stalking. Two chief elements found in most antistalking legislation are threat and criminal intent. Threatening behaviors encompass a variety of acts, including harassment, repeated phone calls or letters, and threats to the victim's family members.^[16] These behaviors are most often manifested in the form of trespassing, displaying a weapon, vandalizing the victim's property, making threats of bodily harm, intimidating the victim and his or her family, and surveillance of the victim. Beyond the simple act, most statutes require police to show that the behavior is ongoing or repeated and that these acts also pose a credible threat to the victim. In establishing a credible case for arrest and prosecution of offenders, criminal justice professionals must establish criminal intent. This aspect of the law is very clear. In order to arrest and prosecute an individual for stalking, it must be shown that the perpetrator's acts meet the standard of intent by being purposeful, intentional, willful, or knowing.^[9]

POLICY ISSUES

A principle question posed to clinicians by policy makers has been "Who stalks?" The answer is needed by legislators to formulate policy and develop remedies to facilitate primary prevention strategies, manage identified offenders, and aid victims. Professionals from various specialties agree that the effective management of stalking cases involves a combination of legal sanctions and mental health intervention. Many clinicians have suggested a multidisciplinary approach to case management that involves clinical intervention and criminal sanctions for the obsessional followers as well as the use of civil orders of protection for the victim.^[12,17] A delicate balance exists between the constituencies calling for new legislation or the reevaluation of existing laws for the protection of stalking victims and the directions of reform that are frequently dictated by behavioral science research. One significant issue that has been placed before policy makers has been driven by the Violence Against Women Grant Office. This office has concluded that in most cases stalkers do not threaten their victims verbally or in writing; therefore, the credible threat

requirements should be eliminated from antistalking statutes making it easier to prosecute cases.^[18] Although perhaps applying to adults, this suggestion is not supported by empirical research for children. Meloy showed that 50–75% of obsessional followers threatened their victims.^[19] McCann found that among children and adolescents the percentage of perpetrators who threatened their victim was just over 50%.^[11] This is particularly important in designing policy that establishes mandatory reporting requirements. Unlike instances of sexual or physical abuse, where reporting criteria are clear, many actions by the obsessional follower may be misinterpreted or simply overlooked due to the age of the offender and victim.

CONCLUSION

We believe stalking is best understood through a multidimensional model involving the relationship of the stalker to the victim, the motivation of the stalker, and the severity of the stalking behavior. Such an approach provides a basis for risk assessment. By developing policy and procedures using comments from each of the domains discussed, medical, behavioral, and legal, administrators can create multidiscipline response to a public health and safety issue. In this way, both victim and offender are addressed, resources of multiple agencies are pooled to converse costs, and expertise possessed by different professions is utilized. By creating a multiagency response from policy inception, one can hope to avoid interagency conflicts regarding jurisdiction and responsibility and promote cooperation.

Much work is needed to develop a comprehensive and yet practical approach to managing juvenile stalking behaviors. Until research is able to fill the knowledge void, administrators must rely on extrapolating from data derived from studying adults and the study of similar behaviors in juveniles, such as general violence and sexual offending behaviors, to generate policy.

This article provides a starting point for administrators faced with developing a response to juvenile stalking behavior or at least coming to a basic understanding of its etiology and trajectory. Given limited research with rigorous methodologies, we approached the issue by examining how the fields of medicine, behavioral science, and law have defined the behavior in question as presented in the recent literature. Although not a comprehensive treatment of the topic given the limits of such an article, we have nonetheless laid the foundation for policy makers to begin formulating a strategy for addressing an important public health and safety concern.

Juvenile Waiver

Craig Hemmens

Benjamin Steiner

Division of Criminal Justice, University of Cincinnati, Cincinnati, Ohio, U.S.A.

INTRODUCTION

The juvenile court was created as an alternate method of dealing with juveniles who ran afoul of the law. Early juvenile court advocates argued that juveniles were less culpable than adult offenders, and thus should be dealt with differently. Dealing with juveniles in a separate court would allow for more attention to the individual needs of the juvenile. This approach differed radically from the punishment-oriented approach of the criminal court system.

By the later part of the 20th century, however, a number of constituencies had become disenchanted with the juvenile court. Conservatives argued that it allowed juveniles who had committed serious crimes to escape with little or no punishment; liberals argued that the juvenile court disregarded the constitutional rights of juvenile offenders. The result was an increase in the use of juvenile waiver. Juvenile waiver is the mechanism by which a juvenile court's jurisdiction is waived, and a juvenile offender is transferred to the jurisdiction of the criminal court. This allows for the imposition of different (and generally greater) sanctions on the juvenile, should he or she be convicted in criminal court.

THE JUVENILE COURT

At common law, persons over the age of 14 years were considered fully responsible for their actions. Children under the age of 7 years were considered incapable of felonious intent, while children between the ages of 7 and 14 years were considered similarly incapable unless it was determined that the child understood the consequences of his/her actions. This was known as the "infancy defense."^[1]

At common law, juvenile offenders received the same punishment as adult offenders and were usually housed in the same facilities. Before the establishment of New York's House of Refuge in 1825, no state bothered to separate children from adults in prison. Soon thereafter, other state reform schools were opened. By 1899 there were 65 facilities for juveniles

in the United States, but juvenile offenders still received the same punishment as adults.^[2]

Several events contributed to creation of a separate juvenile justice system. The Industrial Revolution of the late 19th century transformed America from a rural country to an urban nation. The number of children living in cities increased rapidly, and juvenile delinquency became a problem in many cities. Police and school administrators became concerned about the welfare of these urban children, while others became concerned that the increase in immigrants from Europe was creating social disorganization. The Progressive movement combined these concerns to produce wide-ranging social reforms, including the creation of a separate juvenile court system.

Proponents of a separate juvenile justice system believed that juveniles lacked the maturity and level of culpability that traditional criminal sanctions presupposed, and that juvenile offenders should therefore not only be treated as less blameworthy but also as more amenable to treatment and rehabilitation than adult criminals. The primary justification for creating a separate juvenile justice system was the distinction between punishment and treatment. The criminal justice system at the turn of the century emphasized punishment and deterrence. Separating juvenile offenders from adult criminals would allow the juveniles to be treated instead of punished.^[3]

In 1899 the first juvenile court was established in Illinois, marking the formal beginning of a separate juvenile justice system. Other states quickly followed Illinois' lead. By 1920 all but three states had juvenile courts, and by 1932 all but two states had enacted juvenile codes. By 1945 every state had a juvenile court system.^[4]

The juvenile court system in most states was organized as an entity entirely distinct from the adult court system. Juvenile proceedings were held in their own courtrooms, with judges who heard only juvenile cases. Juvenile court procedure was markedly different from that of the general jurisdiction court. Hearings were private and informal in nature. Juvenile court judges enjoyed enormous discretionary power. Juvenile court jurisdiction was classified as civil rather than

criminal. A whole new vocabulary sought to differentiate juvenile court activities from adult criminal court activities. Juveniles were not arrested; they were “taken into custody.” Instead of indicting a juvenile, prosecutors “petitioned the juvenile court.” Juveniles were not convicted; they were “adjudicated delinquent.” Juvenile court sanctions were not referred to as sentences, but as “dispositions.” Juveniles were not sent to prisons; they were sent to “training schools.”^[3]

The belief that the juvenile court’s primary purpose was to help the child remained a cornerstone of the American juvenile justice system for decades. As late as the 1960s, most state statutes still declared the purpose of the juvenile justice system was to help the child rather than to punish.^[5] In 1967, the President’s Commission on Law Enforcement and Administration of Justice recommended maintaining separate juvenile and adult court systems, even while admitting that the juvenile justice system had so far failed in its task of rehabilitating juvenile offenders.

CHALLENGES TO THE JUVENILE COURT

The juvenile justice system continued to grow in size and power well into the 1960s, when several U.S. Supreme Court decisions forced a change in the form of the juvenile court system and the rising crime rate caused many to re-examine the role of the criminal justice system, including the juvenile court. In *Kent v. United States* (1966), the Supreme Court held that the decision whether to transfer a juvenile to adult court required a full, formal hearing. The Court also established the juvenile’s right to have counsel present at the waiver hearing. In *In re Gault* (1967) the Supreme Court held that whenever a juvenile was charged with an act which could result in his being sent to a state institution, be it a prison or a reform school, he must be accorded due process rights including the right to counsel, the right to confront one’s accusers and cross-examine witnesses, and the right not to incriminate oneself.

At the same time the Supreme Court was forcing juvenile courts to undergo massive internal changes, American society was experiencing a dramatic increase in the juvenile crime rate, which increased by almost 250% between 1960 and 1980.^[6] Between 1960 and 1975, juvenile arrests increased over 140%, while adult arrests during this time increased less than 13%.^[4] Both criminal justice professionals and public sensed that the juvenile justice system was failing to control juvenile delinquency and offending. Some began to blame the juvenile justice system’s emphasis on rehabilitation and treatment for the failure to halt the growth of crime. These “crime control conservatives” believed that the emphasis on treatment was thwarting the

effectiveness of the criminal law, and they called for revision of the methods of handling juvenile offenders.^[7] Chief among the complaints was the criticism of the juvenile courts’ perceived leniency toward juveniles charged with serious crimes.

State legislatures began to respond to the criticisms of the existing juvenile justice system and the calls to “get tough” on juvenile offenders. Many states amended their statutes to emphasize that punishment should either replace, or at least be a coequal concern in the juvenile court’s decision-making process.^[5] One of the most common methods employed to increase the punitive nature of the juvenile justice system was to permit increased use of juvenile waiver process.

FORMS OF JUVENILE WAIVER

Juvenile waiver involves removing a juvenile offender from the jurisdiction of the juvenile court and processing him/her as an adult in criminal court. This process is most commonly referred to “as waiver of jurisdiction” or “transfer,” although it is sometimes referred to as “certification,” “reference,” or “remand.” The two reasons most commonly given for making it easier to transfer juvenile offenders to adult court are: 1) that the juvenile justice system has failed to control these juveniles and 2) these juveniles have demonstrated, either by the seriousness of their offense or by the frequency of their appearances in the juvenile justice system, that they are not amenable to the sort of treatment the system provides.^[8]

There are several different forms of waiver. These include prosecutorial, judicial, and legislative.

Most states employ more than one form of waiver. Additionally, 23 states allow for reverse waiver, wherein a juvenile being prosecuted as an adult may petition to have the case returned to juvenile court. In addition, 31 states have a “once an adult always an adult” provision. This means that once a juvenile has been waived to criminal court, any subsequent accusations are also handled in criminal court.^[9]

Prosecutorial Waiver

Fourteen states and the District of Columbia have prosecutorial waiver. It is sometimes referred to as concurrent jurisdiction or direct file. The prosecutor has the option of filing charges against juvenile offenders in either juvenile or adult court. This method of transfer is perhaps the most controversial, because it vests considerable discretion in the prosecutor, whose primary duty is to secure convictions and who is traditionally more concerned with retribution than

with rehabilitation. Prosecutorial waiver is the least utilized form of waiver.

Judicial Waiver

The most common method of waiver and the one that has the longest history is judicial waiver. The juvenile court judge uses his or her discretionary authority to waive jurisdiction and send the case to adult court. A juvenile court may decide on its own motion to transfer a juvenile to adult court, or the prosecutor may move to transfer and the juvenile court judge must decide the motion. Judicial waiver has received general support from scholars, criminal justice professionals, and professional organizations such as the American Bar Association.

At present, 48 states and the District of Columbia allow for discretionary waiver by juvenile court judges. In the past 20 years, a number of states have modified the judicial waiver process, either by lowering the age at which a juvenile is eligible for waiver or by increasing the number of offenses that are eligible for judicial waiver.

There have been numerous modifications of judicial waiver statutes in the 50 states in the past quarter century. Between 1979 and 1995, 18 states modified their judicial waiver statutes.^[3] Between 1995 and 2002, 27 states modified their judicial waiver statutes.^[10] The nature of these modifications varies. Some states lowered the age at which a juvenile is eligible for judicial waiver. Other states did away with an age limit altogether. Other states modified their judicial waiver statutes by adding offenses to the list of crimes eligible for judicial waiver. Still other states modified their judicial waiver statutes by not only lowering the age at which some offenders could be transferred, but by combining this change in age eligibility with an increase in the number of offenses eligible for transfer.

Legislative Waiver

Another form of waiver, and the one which has received the most attention in recent years, is legislative waiver. Legislative waiver is sometimes referred to as “automatic waiver” because juvenile court jurisdiction is removed automatically, without a motion by the prosecutor or a decision by the juvenile court judge. Statutes exclude specified offenses or offenders from juvenile court jurisdiction. Generally, this exclusion is reserved for the most serious offenses or for repeat offenders.

There are two types of legislative waiver. One type, referred to as offense exclusion, excludes some offenses from juvenile court jurisdiction. These are usually serious, violent crimes such as murder, rape,

and aggravated assault. The reason for excluding juveniles charged with such offenses from the juvenile justice system is that juvenile courts cannot impose sufficiently severe sanctions for such offenses. A second type of legislative waiver excludes from juvenile court those juveniles who possess a particular combination of prior record and present offense. This form of waiver, referred to as “offender exclusion,” is directed at juvenile offenders who have failed to desist from criminal activity despite previous contact with the juvenile justice system.

In the past 25 years, states have made increasing use of legislative waiver, primarily by adding offenses that are excluded from juvenile court jurisdiction or by enacting a waiver statute where none previously existed. In 1979, 14 states had some form of legislative waiver. In 1995, 21 states had some form of legislative waiver. Between 1995 and 2002, 12 states enacted legislative waiver statutes, while 16 states amended existing statutes.^[10]

CONCLUSION

In recent years, the “get tough on crime” movement has greatly affected the juvenile justice system. Liberals decry the system’s occasional disregard for due process and the ease with which the state may intervene in the lives of juveniles. Conservatives complain that the juvenile justice system is too easy on young offenders, that this failure to adequately punish juvenile offenders not only fails to prevent future criminal activity but also fails to adequately address society’s right to punish persons who violate its laws.

The result of this attack on the juvenile justice system has been a tremendous change in the use and application of juvenile waiver, in all its forms. Numerous state legislatures have either lowered the judicial waiver age or have added offenses eligible for judicial waiver to general jurisdiction court. In addition, numerous states have enacted legislative waiver statutes that automatically send an offender to adult court for prosecution based on the offense committed. The increased use of both discretionary and mandatory waiver suggests a continued infatuation with the “get tough” approach to juvenile crime, in the face of crime statistics and research that indicates the practice is not achieving its intended goals.

Knowledge Utilization: Issues and Recommendations

Cheol H. Oh

Department of Public Administration, Soongsil University, Seoul, South Korea

INTRODUCTION

Until recently, information technology was viewed primarily as a means of helping organizations to function more efficiently. However, rapid advances in this area are changing the ways in which government governments, business operates, and individuals conduct their daily lives. Thus, understanding, directing, and managing information-related activities within government have become critical to the success of government programs and policies. Despite the importance of information-related activities, such activities have not been systematically examined, nor has an effort been put forth to build a comprehensive theoretical framework. In particular, why and how government officials use information in policy making is still an open issue. This article critically reviews past studies as well as offers suggestions for future studies to advance the theoretical and methodological state of the information utilization field. In this regard, this article attempts to address two types of issues germane to understanding and improving information utilization in government decision making, that is, theoretical and methodological issues. More specifically, this study, first, examines the state of past studies on knowledge utilization, mainly in terms of theory building and methodological rigor. Second, three frequently cited theoretical explanations for information use are discussed. In the field of information acquisition, dissemination, and utilization/impact, the rational actor model has been employed as a major tool for understanding activities of information utilization in policy making. Thus, this study first examines the assumptions dealing with information acquisition and processing in the rational actor model. It then puts forward an organizational interest and a communications perspective as alternative explanations for information utilization in government agencies. Third, a set of methodological issues including conceptualization of “use” are also examined. Finally, some suggestions are made for both theoretical and methodological improvement in the field of information utilization. Because this study does not include an empirical test of the three theoretical explanations, some of theoretical suggestions seem to be hypothetical. However, they are expected to show how to manage information resources and, thus, facilitate use of information by

government bureaucrats. More rigorous studies are needed to improve the current state of art in the field of information utilization.

A BRIEF LOOK AT PAST STUDIES

In general, most early studies in the 1980s were faced with the dilemma created by the perceived gap between social science knowledge and its under- or non-utilization. The authors, thus, tried to refute the dilemma by suggesting that underutilization is counterintuitive,^[1] that models of knowledge utilization oversimplifies reality,^[2] and that more systematic analyses are required. Some of major findings of the early studies in the 1980s are, according to Sabatier and Jenkins-Smith, that research may be characterized by the “two communities metaphor,” that social science knowledge often serves an “enlightenment” function especially in the public sector, and that researchers need to abandon the role of neutral technician to increase the use of knowledge.^[3] More specifically, Rich summarized what we have learned about knowledge utilization during 1980s:^[4]

- Format, style, and timeliness by themselves will not lead to utilization.
- Who provides the information is more important than what the actual information is.
- Distinction needs to be made between use and impact of information.
- Knowledge produces effects, not a single effect.
- The existence or non-existence of the “two cultures” is not a significant factor in predicting utilization.
- It is almost impossible to predict when and where a specific knowledge input is likely to have an effect on a particular decision.
- Policy development and problem solving are affected by many variables other than information.

Further, the extensive research studies produced inconsistent findings, suggesting that the field of knowledge utilization need to resolve conceptual and methodological problems. As a result, it may be argued that the field of knowledge utilization in the 1980s was in its infancy in terms of theory building and methodological rigor.^[5,6] Within academic circles, the field is not

viewed as one in which theory building has taken place; theory with respect to knowledge utilization is not well developed yet (on page 323 of Ref.^[7]). Likewise, the conceptualization of use often leads researchers to a traditional input–output model; there does not, however, appear to be a warrant to adopt this perspective of measuring knowledge utilization. It is an unrealistic conception of how societal problems are solved, nor does it accurately reflect how information enters into the decision-making process (on page 330 of Ref.^[7]).

Is this field still in infancy in the 1990s? What contributions have these studies in the 1990s made to the field of knowledge utilization? From the review, we can find several common patterns concerning knowledge utilization: 1) knowledge utilization is a more complex process; 2) it is explained by many variables; 3) research-based knowledge is only part of knowledge decision makers seek or receive; and 4) interaction between researchers and user is critical.

More specifically, studies in the 1990s show some advancement in terms of research orientation (e.g., explanation- vs. description-oriented) and focus. As shown in Table 1, most studies in the 1990s are more interested in accounting for the use of knowledge than simply describing the event of knowledge utilization. Most studies reviewed began with the simple question “what affects knowledge utilization.” To this end, some studies tried to suggest models for explanation, though they are not comprehensive. In so doing, a few factors are examined repeatedly as major predictors of knowledge utilization:

- Internal source is more likely to influence knowledge utilization than external one.^[5,8,9]
- Potential users’ needs, values, and interests are critical in understanding knowledge utilization.^[5,9–12]
- Knowledge utilization varies depending on types of knowledge.^[10,13–15]
- The context that shapes the decision-making process affects knowledge utilization.^[5,10,11]
- Interactive processes between researchers and users are important.^[8,16,17]
- A combination of various factors affects knowledge utilization.^[6,18–20]
- The content of knowledge (e.g., specific, concrete, and relevant knowledge) affects knowledge utilization.^[15]
- Access to knowledge is a prerequisite for knowledge utilization.^[16,21]

As mentioned earlier, the way authors in the 1990s approach knowledge utilization is more explanation focused. They tried to understand why some use knowledge, while others do not. Their findings,

however, are not that new.^a For example, types of knowledge was discussed in depth in Refs.^[23–25]. Likewise, the notion of interactive processes is implicitly embedded in the discussion of two communities metaphor that dominated the 1980s literature.^[3,26] Information source (i.e., internal vs. external source) and content of information were also suggested as important factors in Refs.^[25,27]. The decision-making context was also proposed as a significant factor in accounting for variations in knowledge utilization.^{[28,29]^b} What the studies in 1990s actually did was to examine to what extent such factors, indeed, affect knowledge utilization, rather than making speculations and conceptualizations. In this sense, their work may be an improvement. But we wonder if the studies in the 1990s actually found a new factor or a set of factors in helping us understand knowledge utilization.

ISSUES OF KNOWLEDGE UTILIZATION

The idea that social science information should be used as a basis for government action and/or social reform has a long-standing tradition in the social science. According to Weiss, examples of such research go back as early as the eighteenth century for purposes such as prison reform or social relief for the poor.^[32] Although policy research has different functions over time, its one timeless and unique feature is that it is expected to aid directly in the policy-making process. The results of policy research are meant to provide feedback (or checking points) that can be used for program development or change as part of a cycle of policy process (see Refs.^[33,34]).

The basic premise of information/knowledge utilization literature is that using social science information for public policy making is a good thing. Use is good, more use is better, and increasing the use of social research means improving the quality of government decisions (the so-called idealized model of utilization in Ref.^[35]; also see Ref.^[36]). Thus, whatever the setbacks, optimism often prevails: Social science research should contribute to sounder and wiser decision making. This optimistic view of information in the policy process inevitably became the subject of investigation by government practitioners and by detached scholars, who have produced the beginnings of a

^aInterestingly, empirical findings in nursing and health services are not diverse either. Individual-related factors (e.g., education, beliefs, age, years employed, etc.) generally dominated most studies (see Ref.^[22]).

^bFor a specific example, Webber (1987) and Whitman (1985) showed that the use of policy information (e.g., policy analysis) in state legislators and congressional committees was fundamentally different from that in other areas such as health or education.^[30,31]

Table 1 Summary of review

Conceptual clarity	Mode of research (explanation focused)	Framework (comprehensive vs. partial)	Areas of research	New questions/perspectives developed or examined
Slappendel (94)	Tyden (96)	Tyden (96): partial factors and interviews	Tyden (96): health	Tyden (96): recipient's perspective
Lester (93)	Slappendel (94)	Slappendel (94): partial factors and case study	Slappendel (94): private organizations in ergonomics	Hutchison (95): social constructionism

research literature on the production and utilization of social science knowledge by the government. With more information available, government seems to enjoy the luxury of choice; yet, reality tests of that experience do not guarantee confidence that the quality of government decision making has kept pace.

Past studies of information utilization in organization and/or in decision making have generally taken information for granted or assumed it to be essential and seldom worthy of special attention.^[37] If, in some circumstances, information is artificially restricted, scholars of various stripes generally conclude that it is undesirable. It is also assumed, sometimes naively, that expanded information cannot help but improve the efficiency and effectiveness of any policy-making system, mainly on the basis of simple positivism and/or factual efficiency.^[38] As Webber pointed out, “both providers of information and policy makers presume that policy information contributes to a knowledge base that can assist in making sound policies.”^[27] However, the theoretical rigor and empirical validity of this assumption must be tested. That is, does the assumption accurately describe the actual behavior of policy makers in government?

Despite the tremendous increase in attention to the importance of information in the decision-making process, research generally indicates that governmental policy makers make little use of information (see Ref.^[39]). At best, social science research findings alter policy makers’ understandings and/or definitions of policy problems over a long period of time (the “conceptual use”; see Refs.^[36,40,41]).

It seems clear that both practitioners and scholars think that social science research is not used in policy making as much as is expected. Social scientists have long believed that they can contribute to the pursuit of human welfare, but they also believe that social science information is seriously underused in important policy decisions. Policy makers, however, believe that the reports they receive are unintelligible, do not deal with the immediate problems on their agenda, and are not sensitive to the unique pressure for action under which they must perform. Scholars are not, however, satisfied with fact finding about information utilization in policy making. They became more interested in accounting for variations in the use of social science information and, subsequently, improving the use of it.

By employing a single perspective (e.g., rational choice, organizational interest, or communications) and not considering other important variables and their relationships, most studies provide only a partial explanation of information utilization and processing in policy making. For example, the two communities metaphor has been at the heart of most studies of information utilization, in explaining variations in the

utilization or the underutilization of social science knowledge. In the utilization literature, the gap between researchers and policy makers is related to some (or all) of the following factors: availability of information, relevance of information, the form in which it is delivered, etc. If the gap is appropriately met, then utilization will increase. A competing hypothesis (i.e., the organizational interest perspective) to this two communities metaphor holds that factors affecting information use are quite different from factors traditionally considered important and argues that levels of utilization may be best explained by examining routine bureaucratic or organizational roles and procedures. As a result of single-perspective approaches, this area of research seems to lack a comprehensive framework for information processing and utilization/impact. Some scholars warn that this field of inquiry faces a crisis of identity.^[7] The situation is further complicated by the fact that, despite voluminous work on the use of information in policy making, little is known about its impact on policy making. Practitioners and/or scholars simply assume that use of information automatically leads to changes in outcomes of policy making and do not explore the dynamic processes and causal linkages of factors involved in the impact of information.

Overall, we can easily find that there is the conspicuous absence of a greatly expanded understanding of the use of knowledge from past studies.^[42] Taken as a whole, empirical studies in the area of knowledge utilization have suffered from several critical problems (see Refs.^[7,34]). More important, there appears to be serious conceptual and methodological gaps that need to be filled. Under the circumstances, this article attempts to examine some of significant theoretical and methodological problems—building a theoretical framework from an integrated perspective and measuring “knowledge utilization” from a process perspective. It, then, offers some suggestions for future studies.

EXPLANATIONS FOR INFORMATION UTILIZATION

With some knowledge about how information utilization can be understood in the context of information processing in organization or in the decision-making process, a more germane question to this study is why government decision makers are expected to use information, that is, accounting for government officials’ behavior in using information in their daily business. Among others, there are three frequently discussed explanations for information use that address factors affecting use of information and, thus, can help us develop feasible policy suggestions for improving use of information in government.

Rationality Perspective

As Aldrich noted, virtually all scholars agree with what he calls the “fundamental equation” of political behavior, which is that preferences (or values or goals) determine behavior.^[43] Rational choice is about just how those preferences determine behavior. Although there is no universally accepted definition of rationality, rational actor, or rational choice theory, most social scientists agree that rational decisions should confirm to certain basic requirements. This article does not discuss all variations of rational choice/actor theories; rather, it examines basic elements of rational decision making—“basic” because all rational actor theories agree on it.

All “rational actor” theories in the social sciences try to explain “choice” by individuals or organizations. According to theories of rational decision making (for more detail on rational choice and its limitations, see Refs.^[44–48]), humans are rational actors in the sense that they are engaged in the process of “optimizing” their expected utilities (or simply goals), by selecting the course of action with the highest payoff through a comprehensive analysis. All rational actor theories in the social sciences call for a systematic canvassing of possible alternatives, for a systematic analysis of the consequences of each alternative in terms of the values or goals that one wants to maximize, and for possible choices to be guided by such analysis. Consequently, to choose the best alternative among available options, a decision maker is necessarily required to evaluate and analyze the consequences of available alternatives. This is where information becomes central to rational choice theories. As March pointed out, the main rationale for using information in rational decision making is its role in reducing uncertainty in making a choice among alternatives.^[47] In models that maximize one’s utility function, the lack of information is often perceived as the determinant of seemingly “irrational actions.”^[49] Despite the psychological and other constraints (e.g., cost) in decision making, the notion of bounded rationality also assumes that information is essential in allowing individuals to compare alternatives (see Ref.^[48]). In a similar vein, Elster pointed out that if decision makers had little information, rationality required them to abstain from forming and estimating possible consequences of alternatives.^[50]

Regarding information processing, rational actor theories generally assume that all available information about possible consequences of alternative options will be gathered from various sources, so that individual decision makers are “completely” informed of decision situations (see Ref.^[51]). They also assume that information gathered will be used for making decisions, if it is precise, reliable, and relevant.^[52,53] In other

words, information is being gathered for making decisions rational within the limits of resources and cognitive abilities. It is the structure of the process that makes the decision-making process “rational.” Within this structure, one step leads naturally (and automatically) to the next. Thus, the critical role of information is just assumed and not tested.

Given these underpinnings of rational decision making, what assumptions concerning information acquisition and processing would be needed to maintain the consistency and coherence of rational actor theories? Most of the arguments about the relationship between rational decision making and information revolve around the issue of perfect information (e.g., whether an actor has perfect or incomplete information under constraints of time and resources, for example, perfect information about candidates in election; see Refs.^[54–56]). However, this notion of perfect information (or amount of information) is just one dimension of information processing in organizations and individual decision making. The major underlying assumptions of the rational actor theories with respect to information acquisition, dissemination, and use/impact can be summarized as follows:

1. The human mind is capable of processing all sources of available information.^[48,51]
2. All relevant sources of available information will be sought out and should be applied to a given problem.^[53]
3. Once information is acquired, it will be widely disseminated to all who “have a need to know.”^[7]
4. When the information is collected and disseminated, it will be used if it is sensible and scientifically valid.^[39,47,57]
5. Use of information will lead to a choice among competing alternatives; hence, the information will have an impact.^[47]

Oh systematically examined the empirical validity of rational actor theories as an analytical tool for explaining use of information in policy making.^[20,58,59] By examining each stage of information processing, Oh demonstrates that the assumptions of rational actor theories with respect to information processing in individual decision making do not match with real behavior of decision makers. The empirical findings of information acquisition indicate that individual decision makers search for specific sources of information rather than conducting a wide search of available information. Likewise, at the dissemination stage of information processing, decision makers share information more with those in their own agencies rather than disseminating it to other actors outside their agencies. In a similar vein, at the stage of utilization and impact, Oh found that there was no automatic

linkage between information acquisition and its use. Further, the relationship between information acquisition and its use is not linear as assumed in rational actor theories, suggesting that the amount of information acquired does not necessarily get decision makers to use information in decision making. Although there is a positive relationship between use of information and its impact, use of information explains only a small portion of the variance in the impact of information, and the relationship between the two variables is not linear. This implies that use of information does not necessarily entail simultaneous effects after a certain point of utilization. Even when there is an impact, it is not proportional to use of information. Overall, the findings of Oh's study indicate that individual decision makers do not necessarily process information as assumed in rational actor theories and that, at each stage of information processing, different motives and/or factors may be involved.

Organizational Interest Perspective

This perspective derived from the literature on organizations begins with the assumption that organizational rules, structures, tasks, and cultures are essential for understanding information acquisition, dissemination, and utilization. It also assumes that choices with respect to acquiring and using information are predictable: From this assumption, actors make choices that maximize organizational interests (e.g., budget, personnel, or mission; see Ref.^[60]). The bureaucratic literature of the Weberian tradition notes that once bureaucracies begin to develop a position of independent power and authority, they devote much of their attention to securing and maintaining their own autonomy, which is often called "organizational interest" (see Refs.^[7,61]). This notion of organizational interest is especially important for our analysis of information acquisition, dissemination, and utilization in governmental bureaucracies, because it lies at the foundation of bureaucratic power. Concerned about bureaucratic secrecy and fear of how others might use information if it were to be shared with them, bureaucrats tend to seek monopolies over control of information. This tendency toward monopolistic control over acquisition, dissemination, and utilization of information is consistent with bureaucratic decision makers' reliance on their own information and rejection of information from external sources (for more detail, see Refs.^[62,63]). Consequently, in the case of bureaucratic theories, it seems clear that:

1. Information is essential to the power and prestige of bureaucratic organizations. As a result, use of information is basically instrumental for maintaining or increasing bureaucratic power.

2. The desire to protect organizational interest affects information produced in bureaucracies, as well as types of information disseminated to other bureaucratic agencies and the public.
3. Through incentive systems, organizations can control or facilitate use of specific information.
4. There is, thus, a tendency to search for limited information and to rely on the inventory of information already developed within the bureaucracy. Therefore, information from external sources (i.e., outside the organization) will rarely be consulted.
5. The "trustworthiness" and the "credibility" of the information source are essential for use of information. Therefore, selection of information and consequent use of it will happen when the information confirms a policy position or interest already held by a policy maker.

From this perspective, we can now understand the findings of Oh's study presented above.^[58] For example, in the case of information acquisition, decision makers search for information more from their own agencies, rather than touching their decision base with various sources. These results are quite opposite of the assumptions of information acquisition in rational actor theories. However, these results make sense from the organizational interest perspective. As Weiss aptly pointed out, decision makers in bureaucracies do not always search for all possible sources of information.^[64] Instead, they seek particular types of facts or opinions from particular types of sources in selective and strategic ways, ways that might not correspond to what the rationality model predicts. This is because decision makers can trust information from internal sources and because information from internal sources is believed to support their positions on policy issues or interests of agencies. Likewise, bureaucratic secrecy and monopolistic control of information may make decision makers less likely to share information with other decision makers outside their agencies. This occurs to a large extent, because they do not want to share sources of potential power with others. Further, at the stage of information utilization, even the valid and reliable information has little use for decision makers. This is because the content of information may be, although scientifically valid, against interests or goals of decision makers' agencies or because it simply may not be useful to decision makers (see Refs.^[65,66]).

Communications Perspective

Communication-related studies of information utilization often begin with the assumption that there is a "great divide" between the community of science

and that of government or politics and that the linkage problem between both communities serves to explain low levels of information utilization.^[6,20,33,34,39,59,67-69] Most communication-related studies take the so-called “two communities metaphor” as the underlying conceptual framework for their work.^[68] Typically, the gap between two communities is expressed in terms of a few factors:

1. There is great distrust and even antagonism between the two communities.^[67,68,70] It is often observed that considerable tension exists between program officials and researchers. Program officials believe that they have received little help from research. Likewise, researchers are weary of anti-intellectual program managers and their demands for how-to manuals.
2. There is a preference for and use of alternative jargon and language in each community.^[33,67,68] Researchers communicate to their peers in language designed for scholarly journals. Brief, clearly written reports, free of terms familiar to those who are members of a particular guild, will increase the probability of utilization.
3. Researchers and bureaucrats operate under substantially different conceptions of time and worldview.^[7,39] Government officials are accustomed to working on immediate problems and to meeting deadlines. Researchers who are rewarded for producing high-quality research see no harm in delivering a “better product” a week or even a month after the original delivery date.
4. It is asserted that researchers need to be more concerned with the needs of government officials and the relevance of research to these needs.^[65,67,71] Relevance may be expressed in terms of the questions being investigated; is it one of interest to the potential users?

One of the rational actor model's assumptions is that decision makers use little information when they are provided with little information. However, Oh's study showed that the assumption between acquiring information and use of it is not accurate.^[58] Unlike rational actor theories, the communications perspective, for example, explains little use of information in decision making in terms of the lack of interaction between decision makers and researchers. The lack of interaction between the two actors may produce information, which does not meet the needs of decision makers and is thus less useful, although scientifically valid and reliable. Interestingly, more than one-half of the respondents in Oh and Rich's sample also pointed out that social science information was abstruse and unrelated to the day-to-day problems of administering mental health policy.^[6,20] Respondents went on to

answer that they were, thus, less likely to use information in the formation of policy. Therefore, information utilization is increased in cases where policy makers have the opportunity to clarify their concerns, results, and implications of research through feedback to social scientists.

METHODOLOGICAL ISSUES

Traditions in the Measurement of Utilization

Those who have studied how knowledge, especially research-based knowledge, affects decision making (or other types of outputs or outcomes) tend to focus on the following types of questions:

1. What use does information have in decision making?
2. What types of information are preferred? Are some types selectively passed over or ignored?^[33]
3. To what extent do decision makers consider research in their work?^[70]
4. From the time that information/knowledge enters into an organization (through some channel), what happens to it? What are the diffusion/dissemination patterns (see Refs.^[72,73])?
5. What patterns does information follow, as it flows through an organization or through a specific decision-making hierarchy?
6. To what extent does information confirm or legitimate decisions that have already been made or about to be made?^[53] To what extent does research influence a decision maker's position?^[74,75]
7. At what rate do decision makers adopt new information sources?^[62]
8. What are the characteristics of social science research that make it useful for decision making?^[27,70]
9. To what extent does information benefit the decision maker or the decision-making process?^[34,63]
10. To what extent can a person document levels of premature utilization, deliberate non-utilization, and/or selective utilization of information?^[6,25]

The critical assumption behind many of these questions is that many specific decisions can be attributed (or that decisions are “caused by”) to the use of specific bits of data. In this context, a key question becomes “how does one document the use of information or its impact?” In answering this question, researchers seem to have had an input-output model in mind. Within this framework, it is believed that:

- 1) one can trace the flow of information from the time

it enters an organization to the time that some action is taken (predicated on or influenced by the new information); 2) impact or influence can be measured relative to a single piece or cluster of discrete information that enters an organization (or to which an individual is exposed); and 3) it is appropriate and possible to assess the impact or influence of a single piece of information on the problem-solving behavior of an individual.

In short, for purposes of conceptualization and measurement, researchers/analysts tend to adopt a deterministic view of how knowledge (especially research-based knowledge) is disseminated and used.^[64,76,77] Respondents in empirical studies are conceived of as being able to identify how discrete bits of information affect specific behaviors, choices, or actions. Sometimes specific studies are asked about, and, other times, the influence of social science information or policy-related information in general is assessed.

For example, it is believed that users can say, “the study completed by Jones led me to take an action that I would not (or probably would not) have taken, if I had not been exposed to the study.” Implicitly, it is also being said that the information generated by the Jones study is the key element in reaching a decision. The work environment, past experience, ideology, beliefs, and educational background of an individual do not affect a particular choice or decision in the same way or to the same extent that the Jones study does.

In reviewing the empirical literature on the creation, diffusion, and utilization of knowledge, one quickly learns that the assumptions behind the input–output model are not warranted. They are not based on a realistic conception of how societal problem-solving processes operate (for more detail, see Refs.^[34,63,69]):

1. Knowledge produces effects, not a single effect. If one concentrates on a single effect, one will underestimate the impact that knowledge is having.^[42]
2. Decisions do not generally represent a single event; it is difficult to understand a single decision without examining the series of events that led up to it.^[78,79]
3. It is almost impossible to predict where knowledge is likely to have an effect on a particular policy or decision, or what that effect will be. The problem with the input–output approach for conceptualization or measurement is that the assumptions inherent to the model are rarely met.
4. The approach requires that one is able to attribute (in a causal sense) an action to the dissemination and application of specific bits of data or information.
5. Users and potential users have to be able to abstract utilization processes from overall (more general) problem-solving processes.

6. Problem solving is affected by many variables other than information (e.g., ideology, work environment, and demographics; see Ref.^[80]).
7. Use is not always tied to a particular action or choice.

However, if one wants to reject the input–output approach and “advance” beyond it, there are formidable conceptual and methodological problems that need to be overcome.

First, because knowledge accumulates and builds in organizational memories, some decisions (or outputs) are made that seem independent of any identifiable, discrete inputs. The “process” can simply not be traced in a step-by-step, linear fashion. For the analyst and potential evaluator, this poses the problem of not being able to identify the universe of inputs for a particular output or decision. It is also true that the universe of inputs has accumulated and grown larger over time to deal with long-standing issues. Thus, one is not able to judge levels of utilization and the processes affecting utilization at any certain moment.

Second, because knowledge produces effects, it is often impossible to trace outputs back to their specific inputs, even if it were possible to identify the universe of information inputs. It seems clear that input–output models are only appropriate when one is able to analyze the mechanical application of knowledge to problem-solving activities. For example, statistic X is needed to justify policy Y. In that case, a “tracing” approach could work out well. In cases such as this one, outputs can be traced back to specific, discrete inputs. However, it is difficult to trace the subtler, more naturalistic application of information to the myriad of decision-making channels within organizations.

Analysis Methods

The field of knowledge creation, diffusion, and utilization has employed various approaches to measure utilization, utility, influence, and impact (see Refs.^[33,34,81]).

Survey

The most common method has been surveys that ask respondents to provide self-reports on what information they acquired and used. Moreover, the surveys ask respondents to identify the factors that account for utilization and non-utilization (e.g., Refs.^[70,82]). In many of these surveys, respondents use their own definition of use (they are self-anchored responses). The surveys of a relatively large number of individuals at different levels of government, in different positions of power, represent the most popular approach that has been employed. In addition to large surveys, some studies

have also used a small, focused group of elite interviews, and, in some studies, interviews have been combined with case studies.

Social framework analysis

Another approach that has been used is called “social framework analysis.” This approach analyzes how “schools of thought” and “frames of reference” (e.g., the Chicago School of Economics, Merton’s Columbia School, Paul Lazarsfeld’s approach, and others) are identified as particular ways of defining and analyzing problems. It is clear, for example, that Paul Lazarsfeld had a major influence on the shape of American and European sociology, as well as a substantial impact on the way in which public officials think about social issues. Lindblom and Cohen pointed out that individuals could have a major impact on how science and society approach problems.^[83] Often, according to their analysis, this influence follows their own lifetime and cannot be traced in a direct causal path; Lindblom and Cohen wrote of “indirections” and “lags” in achieving influence. Using the example of Keynesian economics, the authors pointed out that varying forms of “information” might take in varying situations “along the long convoluted road to influence.” This form of analysis does not always take on precise measurement; it relies heavily on reasoning and judgment. However, citation analysis and network analysis are often used to chart influence of ideas and individuals over time.

Case studies

Another example of the way in which researchers/scholars/practitioners have tried to understand the process of knowledge utilization is through the case study method. One of the most thoughtful examples of this approach is Horowitz’s *Rise and Fall of Project Camelot*.^[84] Horowitz reviews the basic documents and related critiques, pertaining to the U.S. Army’s controversial South American social science research projects discontinued in 1965. Horowitz concentrates on the use and abuse of social science research. The case study has the basic advantage of being able to cover an event, a program, or a policy from its initiation through the stage of implementation. Its obvious disadvantage is that it is difficult to generalize on the basis of a single case.

Governmental commissions

We have also learned from special governmental commissions, as well as studies of knowledge utilization

and its related processes. Lyon’s *The Uneasy Partnership*, Brim’s *Knowledge into Action*, Orlan’s *Contracting for Knowledge*, the National Academy of Sciences’ *Federal Investment in Knowledge of Social Problems*, and Bloch’s review of research centers are just a few examples of these kinds of studies. These studies generally consist of testimonials and, in most cases, lament the fact that there is not a closer working relationship between government and the scientific community.

Citation analysis

One quantifiable method of assessing the impact of knowledge that is not subject to respondent reactivity (although still subject to researcher selection bias) is citation analysis (e.g., Ref.^[85]). The particular significance of this method is the power of specifying complex interactions among forms of information and types of use. One is also able to uncover complex communication networks.

Experimental designs

The specification of information, situation, and use and the precision with which they are measured through survey research are crucial to the development of a valuable framework for knowledge utilization. However, through the control of extraneous influences and the purposive manipulation of “treatments,” experimental and quasiexperimental research designs offer the potential elimination of certain threats to validity and reliability, thereby increasing the logical certainty with which one can address the kinds of questions central to knowledge utilization as a field.^[86,87] Whereas the field of utilization has not developed to the point where true experiments have been tried on a systematic basis, there have been preliminary attempts to use experimental and quasiexperimental techniques to isolate and assess influences on knowledge utilization.^[88]

WHERE TO GO: SUGGESTIONS FOR FUTURE STUDIES

Given the history of information utilization/impact and its importance, as well as the tensions between the imperatives of science and those of decision making, the key issues in the development of our knowledge of information utilization and impact must be identified. Despite efforts to explain the gap between the perceived need to use information in decision making and the ability to apply this “need” to “practice,” the literature has several serious theoretical and methodological problems (for more detail, see Refs.^[6,69]). Then, the question is how to resolve the problems. This

study intends to offer a set of suggestions that are expected to help scholars to resolve the theoretical and methodological matters discussed previously.

Directions for Theoretical Improvement

Reducing conceptual confusions

The implicit assumption that use of information makes a difference in decision making is fundamentally flawed (for a similar point of view, see Refs.^[39,89,90]). That is, if information is used in policy making, it should help decision makers to choose a specific policy option and/or change existing programs.

This assumption implicitly or explicitly perceives use of information as having a simultaneous, direct effect on decision making. Assuming a direct link between use of information and its impact explains why few studies have addressed the “impact phase” of the information process as the subject of inquiry.

Empirical observations on how information is produced, disseminated, and used in governmental decision making undermine the assumption, because it is not based on a realistic conception of how information is processed in decision making. Like Innes’s argument that information influences without necessarily being actively used, this author’s view is that information can be used without necessarily having an effect.^[66] In fact, a direct, one-to-one relationship between information utilization and its impact does not need to exist. Many variables other than use of information (e.g., work environment, types of information, or need for information) affect the probability that information used influences the outcome of policy making.

Overall, no systematic studies have been conducted to explain comprehensively the impact of information on decision making (for an example, see Ref.^[63]). That is, how and when does information actually influence decision making? Without studying this impact stage, any investigation of the process of information utilization in organizations and/or in decision making is incomplete.

Building a comprehensive framework

The use of information is a complex phenomenon involving environmental, organizational, and attitudinal components, as well as the specific characteristics of information (e.g., sources, content, or quantity of information received by decision makers). As mentioned previously, most studies lack a comprehensive conceptual framework systematically integrating such factors (see Refs.^[66,91]). This problem of lacking comprehensive research is reiterated as one of four challenges facing the field of knowledge utilization.^[92]

The knowledge utilization field is fragmented and needs new synthesis and cross-cutting activities, such as dealing with issues of overlapping definitions or defining appropriate research paradigms for difference types of knowledge utilization research studies.

The authors of past studies often picked variables that they believed were significant for their studies, with little consideration of other factors. As Rich correctly stated, instead of trying to understand the overall problem-solving situation and assessing where utilization fits in, we are focusing on an artificial utilization process that assumes that all the other factors can be held constant.^[7] In other words, the literature has identified factors that affect one or more parts of the information utilization process, but we do not have an overall perspective. The lack of a comprehensive conceptual framework addressing multiple levels of reality has led researchers to much conjecture about the process of information utilization, but with little subsequent systematic empirical investigation.^[80] For example, a decision maker who distrusts research findings may not use such information and think that it is not helpful in understanding emerging problems (e.g., causality or possible solutions).

However, as Rich and Oh pointed out, decision makers may be likely to seek and use more information if their organization encourages use of information in policy making by offering incentives/rewards.^[33] Thus, a study of information utilization and impact, ignoring various factors and based on a single paradigm, is likely to be counterproductive and may actually contribute to the abuse of information. Larsen succinctly pointed out the need of developing a comprehensive framework:^[93]

[F]or some time, the explanation for inconsistent findings of studies was that not enough research had been conducted to permit valid summarization and that more data were needed. However, in many areas, sufficient research results now are available and *the synthesis of these findings is both timely and necessary.* (Emphasis added.)

A more general framework is thus required that 1) identifies and distinguishes the relevant properties of variables involved and 2) examines how these differentiated components are linked.

Explaining causality

The amount of empirical research on information utilization is distressingly small (for an example, see Refs.^[34,58]). As Barber emphatically and correctly stated, “the predominant present view of the sociology of knowledge is of a separate, philosophical, ideological . . . and non-researchable field” (quoted in Ref.^[94]).

Of the few empirical studies, most deal with utilization in terms of a simple description of respondents' answers to specific questions. Or they simply explain the variance in the dependent variable by employing regression methods (for a detailed review of past studies, see Ref.^[33]). This line of research may help us to understand which variables are more important than others in accounting for use of information. This approach, however, does not investigate the causal linkages among the variables involved in the processes of information utilization. This mode of empirical analysis has left the complexity of relationships among variables unexplained. As Dunn and Holzer noted, one of the operating assumptions regarding the knowledge utilization field is that the processes of knowledge utilization/impact are interdependent in their causes and effects and, thus, complicated.^[95] Therefore, understanding causal linkages among the factors will provide a complex and rich understanding of the direct, indirect, and/or spurious influence that variables may have on the use of information and its impact (see Refs.^[6,62,63]). As Huberman pointed out, we should no longer attempt exploratory studies but rather use explanatory and/or confirmatory studies.^[57]

Considering policy areas

Past studies pay little attention to the effects that differences between policy areas (more specifically, types or modes of policy making) may have on the use of information and its impact. They were generally conducted in a single policy area (e.g., unemployment, education, or health). Even the studies employing more than one policy area did not pay analytical attention to their differences (see Ref.^[79]). As Huberman suggested, we may agree on explanatory variables but disagree that they are equally important across policy areas in accounting for information use and its impact.^[57]

In fact, policy area as the subject of inquiry began to get serious attention from scholars after the publication of Lowi's article in *World Politics*.^[96] Until Lowi, policy was viewed as a product—an outcome—of government. In other words, politics or political factors determined policies. However, Lowi reversed this relationship. His idea is based on the assumption that the perceived attributes of the policy process (or different policy areas) determine the attributes of the political process that makes policy. This is because policy areas differ in the major aspects of the political process, such as power structure, primary political unit, or stability of structure. Therefore, if we understand a certain type or area of policy, we are supposed to understand the political process of factors behind the area or type of policy. By the same logic, we can assume that different policy areas can lead to

different processes of information utilization and impact. As March and Olsen noted, information processing varies according to the context in which decision making takes place.^[97] Contradictory motives are often imputed to decision makers, depending on these various contexts. Thus, because the contexts in which information processing occur share little common essence, the effect of different contexts must be explored (see Refs.^[47,69]).

A Suggestion for Methodological Improvement: Utilization as a Process or an Outcome?

From an evaluation perspective, one of the first questions to address is “how should we specify the nature of knowledge utilization?” That is, to what extent should utilization be considered a “process” and to what extent an “outcome”? As Dunn pointed out, to improve the practical consequences of using knowledge, we need to examine the complex processes of knowledge utilization.^[81] To the extent that utilization is considered to be almost exclusively a process, one should ask, “toward what end is the process oriented?” Is it oriented toward some type of instrumental change, toward planning, toward designing services for consumers or other users, or toward generally facilitating effective problem solving? From a process perspective, it is equally important to determine the extent to which using information is a priori good independent of a specific outcome.

However, if one conceives of utilization as leading to a particular outcome or set of outcomes, then it becomes important to be able to attribute an outcome to the use of some discrete set of information (see Ref.^[93]). To what extent is it possible to attribute a particular outcome to the use of information? Attribution, in this case, may refer to:

- Information contributing to the process of achieving particular objective.
- Information influencing the process of reaching an objective in a positive or negative sense.
- Information “causing” an objective or outcome to be reached

Some other types of “outcomes” that knowledge utilization may be associated with include designing a service delivery system or strategy, developing a strategy, helping to change attitudes of individuals or groups, sensitizing service providers to the needs of consumers, informing the public about a particular problem or issue, helping in the formulation of guidelines or regulations, designing incentives or incentive systems, developing a marketing campaign, and other general and specific problem-solving activities (for more

detail, see Refs.^[39,42,78,81]). As already noted, from an evaluation perspective, it may be difficult to attribute discrete outcomes (i.e., in a cause–effect sense, which Rein and White^[77] call “decisionistic”) to the use of specific information. This is and will continue to be a formidable issue for scholars and practitioners alike, because such an understanding of use is overly narrow and rarely valid.

In this context, it may be more relevant to think about the extent to which information, research, and knowledge are contributing to or “influencing” some particular objectives or outcomes. It is also possible that information has been influential in a user’s thinking about an issue or problem. In this case, the user can say that the information had an influence, but that it could not be traced in cause–effect terms. For purposes of measuring utilization, we need to operationalize what we mean by influence. The question about utilization for what or toward what end can be transformed into the question of “if utilization is the proximate outcome, what is the ultimate outcome?”

“Use” is also not an all-encompassing concept, which has the same meaning to everyone. There is no commonly agreed-upon definition of what use means. First, use is different from acquiring and disseminating information. Dissemination simply means that some channel of transmission has been used to send data or information from one source to another. Second, in an evaluation context, it is relevant to distinguish between use, utility, influence, and impact:

1. *Use* may simply mean that information has been received and read; it does not necessarily imply that information has been understood. It also does not imply that an action has been taken after the information was received and read.
2. *Utility* represents a user’s judgment that could be relevant or of value for some purpose that has not yet been identified. It also does not imply that an action has been taken.
3. *Influence*, as alluded to above, means that information has contributed to a decision, action, or way of thinking about a problem. In this case, the user believes that using information aided in a decision or an action.
4. *Impact* is more action oriented. In this case, information has been received and understood and has led to a concrete action, even if that action is to reject the information (also see Ref.^[98]).

These distinctions are significant when thinking of utilization as a process rather than an outcome. This article argues that utilization is a process—a series of events that may or may not lead to a specific action by a particular actor at a given point in time. The utilization process may best be described as a series

of “less than discrete” events or what Weiss called “knowledge creep.”^[70]

In measuring utilization, one is not examining a single, discrete event at one point in time. Knowledge utilization occurs gradually over extended period of time and consists of several events:

Depending on the individual and/or organization, this process occurs over a long period of time, or it may occur within minutes. Within each stage or step, there are several variations of how the process may be operating.

CONCLUSION

Students of information utilization share a firm conviction that knowledge/information has become an inextricable element of society that is irreversibly changing public policy and/or administration. They all stress—directly or indirectly—the urgent need for research into practical experience or vice versa. Only in this way can a solid basis be created for a systematic understanding of the field and for the building of more general theories that can integrate existing partial theoretical constructs.

To this end, an important task commands our attention to developing a comprehensive and appropriate theory of information utilization. A first step toward building such a theory may be to integrate the three perspectives mentioned previously. This does not mean, however, that rational choice or actor theories should be rejected from the mainstream of social science (see Ref.^[99]). Rather, to build “more realistic” models of information acquisition and processing in decision making as a potential contributor to scientific progress in social sciences, each stream of studies should be understood as a complementary explanation for information processing in decision making (see Refs.^[49,100]). A more interesting question would then be “under what circumstances can these perspectives be combined together? and how? or which perspective is more appropriate? and why?” Use of information seems to be more easily explained by various factors than by a single perspective. Further, the causality among the variables assumed may depend on certain factors, such as policy areas, policy types, the nature of problems facing decision makers and/or different stages of the policy-making process (for an example,

see Refs.^[34,63,101]). More important, there is a need to extend the generalizations that are currently considered to be “state of art” in information acquisition and processing. For example, some studies suggest that bureaucratic political factors may be more important in explaining and/or predicting information utilization than communication-related factors, factors associated with the quality of information being presented, or the rationality of decision makers. Then, do bureaucratic processes represent the “sufficient condition”? Or is quality a necessary condition, but not a sufficient condition, for information utilization? These questions need to be answered before a framework that integrates the explanatory variables represented by each perspective can be tested.

It is also clear from the discussion presented in this article that more attention needs to be given to conceptualizing and measuring “utilization,” as well as its related concepts. This is essential to constructing an evaluation framework, in which we are interested in specifying appropriate outputs and outcomes and in which we want to construct effective measures of use and its outcomes. In moving toward this evaluation framework, we need to free ourselves from the shackles of the so-called input–output analysis. However, there are formidable problems that first need to be overcome. From a methodological perspective, input–output analysis is easy and is the only tested method of analysis currently available. We, however, need to meet the task of constructing a more appropriate evaluation framework. The issues identified in this article are expected to provide a starting point from which to build.

Labor Policy in Thailand

Andrew Brown

*School of Social Science, University of New England, Armidale,
New South Wales, Australia*

INTRODUCTION

Historically, labor policy in Thailand has emerged from contests that have involved competing constellations of economic, political, and ideological interests^[1] Recently, these contests have been dominated by those particular interests aligned with Thaksin Shinawatra's Thai Rak Thai party (TRT) which formed a government in January 2001. During its first term in office, the TRT government has implemented economic and social policies that embody a broad twofold objective: first, to restructure economy, politics, and society in order to build a globally competitive capitalism; second, to manage the conflicts and tensions that processes of restructuring have generated. Labor policies both reflect and form a significant component of the government's pursuit of these dual objectives.

THAI RAK THAI AND ITS HEGEMONIC VISIONS

Thaksin Shinawatra and the TRT electoral victory signaled the rise to state power of a new alliance of economic, social, and political interests dominated by big domestic capitalist groups.^[2] Over the past 4 years, the new government has engaged in a singular attempt to reform and rejuvenate a political economy devastated by the 1997/1998 economic crisis. In the economic arena, the government has expressed a desire to free Thailand from past growth strategies that emphasized the export of commodities with low-valued added content produced by cheap unskilled wage-labor. Rather, the administration has emphasized the need for new skills, increased productivity, value adding, industrial upgrading, and the creation of a more sophisticated and globally engaged knowledge economy. Recognizing that the attainment of these aims requires long-term political stability, the TRT government has embedded its control over the state bureaucracy, circumscribed the operations of independent regulatory bodies, cemented its domination over parliament, curbed the demands of civil society, and through a range of campaigns, attempted to create a more ordered and disciplined society. Finally, the Thaksin government has also engaged in a political process of developing a new social contract, the functions of

which are twofold: first, to "provide a 'cushion' against social disorder...[and]...prevent political problems destabilizing entrepreneur-led growth;" and second, to "encourage the Thais to be more entrepreneurial." Both are meant to serve as a strategy for "deepening and expanding capitalism."^[3,4]

It is within this context of rebuilding domestic capitalism by pursuing new development directions, entrenching its political rule, instilling discipline in society, and developing a new social contract that the Thaksin government has addressed itself to Thailand's labor problems.

THAI RAK THAI AND LABOR PROBLEMS

Throughout the late 1980s and 1990s, as Thailand became embedded in global patterns of flexible production, labor policy became an increasingly complex arena of debate in terms of both the sheer scale of problems that emerged and the range of competing interests that attempted to shape policy outcomes. In addressing itself to the country's labor problems and navigating its way through the plethora of competing voices and interests, the Thaksin government has produced two clusters of policy interventions. During its first 2 years in office, government responses to labor issues were shaped by its overriding aim to reignite economic growth, promote investment, increase employment opportunities, inculcate a spirit of entrepreneurship, as well as assist business restructuring. During the latter half of its first term, the government has begun to address itself to structural issues such as bureaucratic reform, skilling, labor standards, as well as deal with some of the tensions generated by structural change and labor's deepening exposure to the vagaries of market forces.

Reigniting Growth and Meeting the Needs of Domestic Business

During its first 2 years in office, the Thaksin government's main priority was to reignite economic growth through a strategy of increased government spending. Using funds from the Government Savings Bank and the Government Agricultural Bank, the TRT

government introduced a 1 million baht community fund, established a People's Bank, and also launched the One District One Product Scheme. Other government banks provided credit for small and medium enterprises and a debt moratorium was extended to farmers. Government also endeavored to reduce household expenses, thereby releasing funds that could be used for consumption in other areas. To this end, a new 30 baht health care system was introduced, together with a cheap life insurance scheme, low-cost housing, supplies of cheap computers, and televisions, as well as subsidized credit for the purchase of taxis and bicycles. Combined, these measures aimed to make credit available to households and small and medium size firms, stimulate domestic demand, create employment opportunities, as well as foster a spirit of entrepreneurship.^[5]

While these policies aimed to reignite economic growth, investment, and expand employment, the government also assisted employers as they reorganized and restructured their businesses. For those that survived the 1997/1998 economic crisis, the postcrisis years had seen firms, across a range of industries, pursue strategies designed to reduce costs of production and wages in the face of intense local, regional, and global competitive pressures. Such strategies have included widespread retrenchment and downsizing of workforces, reducing wages and benefits, experimenting with flexible forms of employment, introducing new technologies, implementing new forms of human resource management, as well as spatially relocating operations, often to border areas, in order to take advantage of cheaper foreign labor. These processes of restructuring have been bitterly contested by workers as they have struggled to retain jobs, maintain conditions of employment, and secure fundamental labor relations reform that would better guarantee their legal rights to compensation, wages, benefits, and workplace participation.^[6]

Prior to the 2001 elections, TRT recognized many of the problems that workers faced as business was restructured.^[7] During its first 2 years in office, however, the government failed to deliver on its preelection promises to provide better protection for workers by closing loopholes in key labor laws and to initiate processes of more fundamental legislative and institutional reform. Nor did the government do anything to bring a halt to the union busting that has become a feature of the industrial relations arena since the economic crisis of 1997/1998. Indeed, in what can be seen as an important signal to business generally, after Thaksin's own Shin Corp purchased independent TV broadcaster iTV, it sacked 21 employees all of whom were members of the newly established union, with 9 of those sacked on the union board. Through this leading by example and through policy inertia,

the government effectively gave domestic capital a valuable breathing space within which employers could, without fear of government intervention, restructure their workforces, experiment with more flexible forms of labor, rid themselves of troublesome unions and activists and generally evade their industrial and social responsibilities to provide safe working environments and reasonable remuneration for work performed as stipulated by various laws and regulations. At the same time, this failure to protect basic rights and allow organized labor to be progressively weakened formed part of a wider process through which the Thaksin government sought to reconfigure domestic politics by curbing the demands of civil society groups.

Bureaucratic Reforms and Addressing Structural Issues

While the Thaksin government dawdled on labor relations reform during the first 2 years of its term, it has been more active since late 2002. This coincides with some initial attempt to pursue longer-term goals of utilizing labor skills and other national assets that can be deployed toward the objective of moving up to higher-valued production and a knowledge economy. The TRT's intentions were signaled by the removal of the incompetent labor minister Det Bunlong and the installation of Suwat Liptapanlop. This coincided with a significant period of restructuring as the former Ministry of Labor and Social Welfare was reformed to become the Ministry of Labor (MOL), while a new Ministry of Social Development and Human Services was created. Suwat appointed a team of 10 advisors and promised a solution to 23 key labor problems within 2 years.^[8] He also oversaw significant modernizing reform of Ministry standards, practices, and procedures to ensure that processes of data collection and statistical analysis were streamlined, that staff receive improved training to cope with changing technologies, and that the Ministry will have an enhanced capacity to engage in international dialog on labor issues. In particular, the Ministry assumed as a major function the creation of a better skilled workforce and ensuring that workers receive remunerations in line with international standards and skill levels. Apart from better catering to the skill requirements of the domestic political economy, the Ministry has also adopted an enhanced role to promote employment and create new markets for Thais wishing to work overseas.^[9] At the same time, Suwat presided over the ousting of several senior labor officials who had been involved in a job placement scam involving hundreds of millions of baht.^[10] These reforms to a Ministry that has long been considered to be incompetent and corrupt, in part, reflect the government's desire

to meet the challenges of regional and global competition and develop a more knowledge-intensive economy and a better-skilled labor force.

Developing Skills and Meeting International Standards

In pursuing new growth strategies, TRT recognized the limitations of Export Oriented Industrialisation (EOI) that relied on the use of cheap unskilled labor. Rather, as noted above, the government has stressed the need to develop a better-skilled and more productive workforce that will meet the changing requirements of local industry as well as the lucrative labor export market. In 2002, the government passed a law on the Promotion of Labor Skills and launched a number of programs to foster public-private sector cooperation to develop the nation's human resources. These initiatives have included enhanced cooperation with the private sector in establishing industry skills standards and developing centers to train workers to meet prescribed standards; a cooperative scheme between the Skills Development Department, universities, and employers, to establish workplace schools to upgrade worker's literacy and numeracy; improved workplace training for vocational students; a scheme that allows workers to convert working experience into educational certification; promotion of employment through local knowledge in food production and cooking, massage, child and aged care, and housekeeping; benchmarking and raising standards for 149 targeted occupations to ensure that labor meets local and international market demands; and the establishment of employment centers that will better match workers' skills with employers' needs (see Ref.^[6], p. 17–18).

There are least two motivations for these initiatives. The first is economic. Following the crisis there was a realization that competing economies have been deregulating labor markets, and that there was the potential for Thailand to slip behind, especially as both TRT and the previous government had moved slowly on labor relations reform. The second, related, motivation for these policies was in response to concerns expressed by some politicians, business people, and officials about the ways in which Thailand's poor record on labor standards might negatively impact on foreign investment and access to developed country markets.

This thinking about the competitive need for a more socially responsible business sector saw the government emphasize international standards when it ratified ILO Convention 182 on child labor in 2001 and in May 2004, the government ratified the related ILO Convention 138. These initiatives were accompanied by other measures to protect children from workplace abuse. In December 2001, the government directed the

MOL to establish a Labor Standards Project to educate employers on the need to adopt international practices in order to avoid trade sanctions, improve productivity, and minimize disputation. In 2002, a substantial government budget was earmarked for preparing employers and workers for further trade liberalization. In 2003, a *Thai Labor Standards 2003: Thai Corporate Social Responsibility* document was issued, covering issues such as forced labor, remuneration, working hours, discrimination, penalties and fines, child labor, gender issues, freedom of association, collective bargaining, and occupational health and safety. For each category, basic provisions and standards were established and employers were encouraged to conform.

The New Social Contract and Managing Conflict

The crisis and its social impacts combined with subsequent processes of work and industry restructuring generated significant labor protest (see Ref.^[6], p. 15–16). In the private sector there have been a number of long-running disputes and protests at particular factories some of which have attracted international attention. Over the same period, the Labor Relations Committee has had to mediate hundreds of disputes and grievances that collectively have involved thousands of workers. Moreover, the Labor Courts have become choked with numerous unresolved cases. In league with their unions, labor affiliated nongovernment organizations (NGOs), human rights activists, as well as through links with various labor campaigns outside the country, Thai workers have pressed government to enforce existing labor laws as well as produce a reformed body of legislation that will close the legal loopholes that employers have been exploiting as they have restructured their businesses.

While still not directly addressing many of the issues that have generated industrial tensions, the TRT government considers that its new social contract will offer improved protection to the poor, be acceptable to workers, and deliver continued political support. The social contract is constructed around five TRT election policies: the million baht village and community fund (VCF), a 30 baht universal health scheme (UHS), the people's bank, the one district-one product scheme, and a farmer's debt moratorium. The projected cost of these policies was more than US\$3.6 billion, with the VCF and UHS accounting for about 90% of this, and claiming 52 million beneficiaries by late 2002.

During the last half of its first term, the Thaksin government has also implemented a range of policies that have specifically targeted workers. Social security

coverage has been extended to those employed in small firms as well as to agricultural and some casual workers. In January 2004 a new unemployment scheme was finally introduced. Workers have also been promised low-cost housing as well as improved educational opportunities for their children. The government has also begun to address some of the problems faced by working mothers by establishing child care centers in key industrial areas. A very recent Ministerial Order also extends to home based workers, many of whom are women, improved protection with respect to wages, the delivery of completed work and health and safety. The government has also finally begun to consider a draft labor bill recently released by the Council of State. The proposed new law will replace the long outdated 1975 Labor Relations Act which governs collective bargaining and rights to organize.

CONCLUSIONS

During its first term, the Thaksin government faced the task of balancing the requirements of capital restructuring against the necessity of maintaining social stability and cohesion as well as securing ongoing political support for its policies. The government's interventions on the labor front both reflect and form an important component of this broad endeavor. During the first 2 years of its term, the government acted at a glacial pace on labor reform, which gave domestic business the space to reestablish its competitiveness by reducing labor costs. Over the latter part of its first term, the government has been more active in addressing problems of bureaucratic reform, skilling, and labor standards. It has also attempted to deal with some of the tensions generated by restructuring by extending social security coverage, inaugurating an unemployment scheme, as well as offering some improved education and skilling opportunities,

promoting employment overseas and cleaning up labor recruitment practices.

Labor–Management Partnerships and Cooperation

W. David Patton

*Center for Public Policy and Administration, Boise State University,
Boise, Idaho, U.S.A.*

INTRODUCTION

Labor relations in the United States developed in an atmosphere of conflict between management and labor. The laws and practices of labor–management relations that were established to mitigate this conflict continue to guide labor relations today and reflect our adversarial tradition. However, as a result of labor–management strife and national emergencies, such as the Great Depression and world wars, organized labor and management began working together to resolve their differences. In recent years, there has been increasing pressure for management and labor to work together to solve common problems through labor–management cooperation in the form of committees or partnerships.

BENEFITS OF LABOR–MANAGEMENT COOPERATION

Rancorous battles between management and labor are not only unpleasant to observe but have serious impacts on productivity and efficiency. In the year 2000, over 20 million workdays were lost due to strikes in the United States.^[1] Disputes between management and labor are often settled by formal bargaining, arbitration, or legal processes rather than through collegial discussion. This process is time-consuming and results in settlements that are often unsatisfactory to either side. Labor–management cooperation is a process and a different approach to labor relations. Employees are involved through their representatives in the day-to-day decisions of public and private organizations. Issues of interest to management and labor are brought before joint committees for discussion, study, and resolution.

Evidence shows that the benefits of cooperation as opposed to adversarialism can be substantial. For example, the Social Security Administration improved its customer satisfaction ratings through its partnership with the American Federation of Government Employees (AFGE). The Internal Revenue Service has improved the quality of their services through joint training and streamlining programs in cooperation with the National Treasury Employees Union (NTEU). A joint productivity effort by the Customs

Service and NTEU increased the amount of illegal narcotics seized by 42%. The Social Security Administration, Bureau of Reclamation, Department of Health and Human Services, and other federal agencies have saved over \$10 million largely due to decreases in litigation over grievances and charges of unfair labor practices. Other benefits include improved quality of work life and better labor–management relations.^[2]

Although most people would prefer situations where parties of differing interests cooperate rather than fight one another, there are reasons for the adversarial context of bargaining and benefits similar to the benefits of the adversarial structure of our legal system. An adversarial system allows for a process where the viewpoints of both parties can be heard. The positions and interests of each side can be clearly stated, and accommodations to these interests can be negotiated. In an adversarial system, power is distributed more evenly, and it is more difficult for one side to dominate the other. For this reason, federal law has prohibited employer involvement in union activities. Finally, in the event that the interests of both sides are irreconcilable through negotiation, an adversarial system allows for the exercise of economic and political power through sanctions such as the strike or boycott. Many adversarial labor–management systems call for third-party intervention when both sides are at an impasse, using mediation or arbitration, in which resolutions to disputes can be made by an objective outside party. In some cases, the adversarial nature of traditional collective bargaining can be more appropriate than labor–management partnerships. Labor–management cooperation is not intended to replace collective bargaining but can be an important tool where appropriate to resolve workplace issues.

THE DEVELOPMENT OF LABOR–MANAGEMENT COOPERATION

The earliest forms of labor–management cooperation were committees in the textile and railroad industries—both hotbeds of labor unrest in the early 1900s. The National War Labor Board sponsored labor–management productivity committees during World War I, and during World War II, over 5000 labor–management committees were formed to

improve productivity in American industries.^[3] Following the war, these committees were abandoned by industry, which probably contributed to the record number of strikes in 1946.^[4] More cooperative labor-management relations became the objective of legislation passed between in 1947 and 1978. The Labor-Management Relations Act of 1947 (popularly known as the Taft-Hartley Act) authorized the Federal Mediation Service as an alternate means of settling labor disputes. The Civil Service Reform Act of 1978 allowed collective bargaining on limited subjects in the Federal Government and established the Federal Labor Relations Authority that hears and decides cases on negotiability, unfair labor practices, and exceptions to arbitration awards. The Labor Management Cooperation Act of 1978 authorized the Federal Mediation and Conciliation Service to assist in the establishment of labor-management committees.^[5]

PUBLIC-SECTOR LABOR-MANAGEMENT PARTNERSHIPS

The first public-sector labor-management committees were formed in the mid-1960s and have expanded throughout federal, state, and local levels of government.^[3] Labor-management relations in the federal government, like the private sector, have been marked by conflict since federal employees were allowed some bargaining rights by executive order in 1962 and later in the Civil Service Reform Act of 1978. A 1991 General Accounting Office report concluded that relations between management and labor in the federal government were “overly legalistic, too adversarial, and bogged down by litigation,” and called for reform that would motivate cooperation and productivity. In its report on federal productivity and performance, the National Performance Review recommended that the federal government establish labor-management partnerships to “transform the adversarial relationship that dominates federal union-management interaction into a partnership for reinvention and change.”^[6]

EXECUTIVE ORDERS OF PRESIDENT CLINTON AND PRESIDENT BUSH

Shortly after the NPR report, President Clinton issued Executive Order 12871 establishing the National Partnership Council to promote labor-management partnerships in the federal government. The Order also directed Executive agencies to establish labor-management committees to help reform government, include employees and their union representatives as full partners in these committees, provide training in dispute resolution and interest-based bargaining, and

evaluate their progress. The most controversial directive in Executive Order 12871 required federal managers to include the typically management functions of how employees are assigned and how the work is to be accomplished as “mandatory” bargaining subjects. These subjects had formerly been considered “management rights” and could only be the subject of bargaining if the agency chose to include them in negotiations. President Clinton reaffirmed his commitment to partnerships in a 1999 memorandum to executive agencies of the federal government.

The response to Executive Order 12871 among federal agencies has been mixed. Most of the agencies reporting on their progress with labor-management partnerships^[2] said they had formed partnership councils. However, responses to the other requirements of the Executive Order were less than enthusiastic. Less than half of responding agencies reported substantial union involvement. Nearly half of the agencies were providing dispute resolution training, but less than one-sixth said they had agreed with their unions to bargain over employee assignments and the way work is done. Most agencies were reluctant or had refused to bargain over these subjects, which seriously damaged the confidence of unions in the commitment of management to the partnership concept. Similarly, few agencies had evaluated the effect of labor-management partnerships on the organization or developed quantitative data to support conclusions that partnerships had improved performance and productivity within federal agencies. Of those reporting results, there is some evidence that labor-management partnerships have been successful in improving customer service, quality of service, productivity, efficiency, cost savings (usually a result of less litigation in labor relations), and improvements in the quality of work life and labor-management relations.

On February 17, 2001, shortly after taking office, President George W. Bush issued Executive Order 13203 revoking Executive Order 12871 and subsequent executive orders establishing labor-management partnerships in federal agencies.^[7] President Bush most likely had political, strategic, and philosophical reasons for revoking authorization for labor-management partnerships.^[8] The fundamental reason for revoking labor-management partnerships was ideological. Supporters with influence on the President believed these partnerships “elevated the status of federal unions to a level of equality with agency management.”^[9] This view saw union encroachment on management authority, displacing political accountability from citizens to union members. The U.S. Office of Personnel Management subsequently issued guidance to federal agencies for implementing President Bush’s executive order, saying “Agencies have discretion . . . to adopt a labor relations strategy best suited to their own needs.”^[10]

TYPES OF LABOR-MANAGEMENT COMMITTEES

Every committee developed to formalize labor-management cooperation is designed to meet the needs of the people involved, and therefore, every arrangement is somewhat different. However, successful labor-management committees have some common characteristics. Because labor-management cooperation began spontaneously in reaction to crises or with the objective of being more productive, labor-management partnerships take on many forms. Almost all labor-management committees can be categorized into three structural types: work-site, industry, and area labor-management committees.

The most common form of partnership is at the most local level, the work-site labor-management committees (W-LMC). Work-site partnerships are designed by union and management leaders to address the needs of each workplace and address common issues. W-LMCs may seek to improve communication between management and labor, address issues before they come to formal grievance situations, or study issues so each side has consistent information. An example of a work-site labor-management committee is the agreement between the Port of Baltimore and International Longshoremen's Association and Steamship Trade Association. This partnership seeks to improve the competitive position of the Port of Baltimore and the skills of its workforce. A second form of cooperative arrangement is the industry labor-management committee (I-LMC). These committees are defined by a geographical area and specific industry and provide a forum for discussion of issues affecting both management and labor. An example of an I-LMC is The Construction Industry Service Corporation (CISC) in Northeastern Illinois. CISC provides a scholarship fund, apprenticeship program, and construction financing services. The next level of partnership is the area labor-management committee (A-LMC) that serves a community or regional area. A-LMCs assist in developing work-site committees, promoting communication, improving work conditions, encouraging job retention, skill training and economic development. The Philadelphia Area Labor-Management Committee (PALM) is a partnership between the AFL-CIO and the Greater Philadelphia Chamber of Commerce. PALM provides labor-management relations assessments, team-building training, work-site productivity, quality and safety designs, and third-party issue resolution.^[11]

Labor-management committees are the formal structures of cooperation between management and labor, but these structures cannot sustain themselves without the commitment of organizational leaders from management and labor to the philosophy,

principles, and processes of labor-management cooperation. Typically, the committee organization would allow for a structured meeting of representatives from management and labor, open access to information, and cooperative problem solving. Employees are included in the process of day-to-day decisions where their jobs are affected. Leaders and employees in the organization operate under the philosophy that cooperation will allow for higher productivity and a more enjoyable work environment.

CHARACTERISTICS OF SUCCESSFUL LABOR-MANAGEMENT COOPERATION

The experiences of labor-management cooperation efforts throughout government have produced a consistent set of characteristics for successful partnerships. These characteristics include attributes common to any collective activity and highlight the context, processes, and purposes of the partnership. To operate a successful labor-management partnership, it is helpful to incorporate the following principles.^[12,12]

1. Common understanding of the nature of the partnership: All interested parties to the partnership should understand the need for cooperation and the purposes for the creation of the partnership. The roles of management and labor are different from typical labor relations and need to be resolved before progress can be made.
2. Mutual respect and trust: Successful partnerships display respect for the positions held by both sides and respect for the people involved. Trust is developed over time but is crucial to cooperative efforts to solve problems and prepare plans for the future. Often, the partnership is based on a strong personal relationship between management and labor.
3. Broad-based support: Support for a cooperative approach to labor relations must come from all levels of the involved organizations. Commitment to the philosophy and processes of collaborative problem solving needs to come from the leadership of union and management as well as mid-level managers and front-line representatives who will be involved in the day-to-day activities of the partnership. The principles of the partnership should be incorporated into the everyday operations of the organization.
4. Long-term outlook: The current system of adversarial labor relations developed over many decades of trial and error. A major change to a cooperative approach will take

time. The parties to the partnership have to understand that trust and respect are earned and will come with experience. Complex problems require sufficient time for deliberation and for solutions to gain acceptance. Participants in the partnership should develop a positive vision of the future and work toward that goal.

5. Investment in the process: To effectively work in partnerships, management and labor representatives should undergo training in group processes, problem solving, and interest-based negotiation. In addition to training, management should be prepared to allow for the time needed for effective meetings of the partnership.
6. Mutual objectives: The objectives of the partnership should be in the interest of all those involved in the process. Agreement should begin with the selection of objectives throughout the duration of the partnership. Everyone should benefit from his or her participation.
7. Appropriate issue selection: It is important to the success of the partnership that it experiences quick, even if small, wins to demonstrate the viability of the partnership. Eventually, however, it is important that the partnership work on more complex problems such as productivity improvement or reorganization. The cooperative approach to problem solving works best when there is some convergence of the interests of the participants. When there is little room for compromise, it is sometimes better to rely on other methods of dispute resolution such as collective bargaining. Successful partnerships have separated their work from the collective bargaining process and carefully decided which issues to address in either forum.
8. Proactive rather than reactive: The philosophy of labor-management partnerships lends itself to thoughtful deliberation and strategic planning. The committee should consider issues, opportunities, and threats that present themselves in the future for action of the partnership.
9. Political neutrality: The influence of political ideology or organizational factions can seriously damage the credibility of labor-management partnerships. Cooperation is neither conservative nor liberal; it is a philosophy addressing an effective approach to solving issues of mutual concern to employers and employees in organizations. Similarly, the existence of hidden agendas of those participating in partnerships can harm the relationships needed for effective cooperation.

10. Flexibility: One of the most enduring characteristics of public organizations is the element of change—as the shift in executive orders on labor-management partnerships demonstrate. Partnerships need to be adaptive and responsive to the needs of the employer and employees. As changes occur, the partnership needs to be ready to take on issues as they present opportunities or threats to the organization.

Labor–Management Rights and Responsibilities

D. S. Chauhan

*Department of Political Science, Bowling Green State University,
Bowling Green, Ohio, U.S.A.*

INTRODUCTION

The discussion on the issue of management rights in collective bargaining has undergone a significant change during the past 40 to 75 years, both in the public and private sector, respectively. The change in our understanding of the application of the concept in the public sector is influenced by various factors involving scope of bargaining, civil service rules, merit-based personnel policies, organizational democracy, participative management, and the changing nature of the work environment. The emerging social, economic, political, and technological changes have also contributed to our thinking about the management rights, and managerial control and authority.

THE CONCEPT OF MANAGERIAL AUTHORITY

Conceptually, the literature on labor–management relations continues to use various terms to describe managerial authority. These terms include “management rights,” “managerial authority,” “managerial control,” “management prerogatives,” and “managerial incentives.” At the base of all these concepts is the thinking that the hierarchical structure of the organization gives the managers the privilege to direct, control, and supervise the activities of the employees or workers to achieve the agency’s mission and statutory goals. However, the term “administrative or managerial responsibility” is lacking the measurement of the moral or ethical dimensions of administrative responsibility as characterized by either inadequate “action” or “inaction” in dealing with policy or personnel issues affecting labor–management relations. The traditional labor relations literature articulated two views of the management rights concept usually applied by the arbitrators and courts as “residual rights doctrine” or “implied obligations” doctrine. The residual rights doctrine is more popular with management practitioners and the “implied obligations” doctrine is more attractive to public managers “to negotiate changes in terms and conditions of

employment even in the absence of an express contract provision covering the issues involved.”^a There has been increasing popularity among behavioral scientists to support a position based on the theory of employment contract, suggesting that the management may have property right to allocate the resources needed to run the organization. However, the management of human resources requires the consent of the managed. Workers have no legal compulsion to cooperate with the management.^[1] Killingsworth made a similar argument, noting that the reserved rights doctrine does not have adequate value as a legal principle because it ignores the power relationship between the employer and employees.^[2] Similar views of management rights were articulated by behavioral theorists such as Chester I. Barnard and Herbert Simon, who stated that “the authority of the management depends on the employees acceptance of management’s right to direct employee behavior.”^[3] Whether they accept a narrow or broad degree of managerial authority, it may depend on the attitudes of workers or work groups. As Professors Keohan and Katz stated: “In practice, therefore, the work force’s acceptance and practical definition of management rights may deviate considerably from the specific rights provided in the labor agreement and from the philosophical arguments found in the management or administration literature.”^[4]

NATURE OF EMPLOYER–EMPLOYEE RELATIONSHIP IN GOVERNMENT

The nature of employer–employee relationship in government has changed over a period of time, bringing into existence a new set of realities, policies, and organizational structures. The attitude of government as a sovereign authority has also changed from

^aFor a discussion of these two views, see Frank Elkowri and Edna Asper Elkowri, *How Arbitration Works*, 3rd edition, Bureau of National Affairs, Washington, DC, 1976; 412-435.

negative control and confrontation to accommodation and continuing adjustment giving rise to the notion of bilateral decision making based on mutual respect and cooperation. The management rights in this collaborative environment are influenced by various legal, organizational, and environmental constraints. The other important factor that affects employer-employee relationship is the question "where does the management start?" It is quite different in the public sector, and the term "management" has to be used more loosely because the decision-making authorities of government (both legislative and executive) can grant or deny what the unions want. Also, the management authority is so diffused that varying amounts of authority are given to executives by city or county charters.

The discussion on "relationship clauses" in various contracts may show that management rights are legibly defined. In many cases, a union cannot control or bargain over a major decision on funding, manpower utilization, and operating standards, but can negotiate or file grievances over the details of their implementation. The boundary is uncertain and the distinction is fuzzy because the management directs the work with the employees' consent. The problem is further complicated by the political nature of the relationship.^[5] These uncertainties and blurred boundaries between the authority of management and the rights of the union (members) led Gene Huntley to observe that management rights' clauses were originally intended to keep unions out of specific management decisions entirely. As the unions grew in power and strength, management rights clauses served less as fences and more as signposts.^[6]

OBJECTIVES OF MANAGEMENT RIGHTS

The development of industrial conflict is basically economic and arises from the persistent urge of working people, and from resistance by owners and managers to many of the changes that the resolution of the conflict requires.^[7] A review of labor relations' literature in the United States and Europe reveals four major patterns of relationships. These include 1) *confrontation* characterized by attack and resistance techniques very common in early history of the labor-management relations in the United States; 2) *cooperation* characterized by working together under law to achieve common purpose (legal contract); 3) *collaboration* viewing conflict as dysfunctional for all, and reinforcing the genuine desire to work together aimed at eliminating conflict and embracing the health of the organization; and 4) *codetermination*, mostly common in Europe, requires that primary policies and operating decisions be made in a

codeterminate manner between labor and management.^[8] The decision-making process is influenced by a unity of function and the interdependence of such other factors as employee needs, expectations, perceptions, and the relative power advantage available to the parties impinging upon the decision-making process.^[9]

Why Management Rights/Prerogatives?

Almost all labor-management contracts incorporate the management rights clauses to:

1. Provide management an authority or incentive to manage.
2. Carry out the mission of the agency.
3. Promote administrative/managerial efficiency.
4. Establish policies concerning hiring, firing, demoting, and reassigning employees.
5. Discipline employees for their willful failures or negligence in following agency rules or government laws.
6. Take corrective actions to modify the behavior of employees.

Protecting Individual Rights in Collective Bargaining

The scope of the constraints imposed on management rights may differ from jurisdiction to jurisdiction and among states or federal government, depending on the comprehensive nature of their labor relations program. In the context of labor-management rights, another important issue that requires adequate attention is how to protect the individual rights in collective agreements? Normally, union represents individual interest as part of the collective agreement. However, it is the grievance procedure in the contract that provides for a protection clause. It is through the grievance procedure that the union can share the rights of management. A grievance may be defined as any complaint—legal, imagined, or contrived—on the part of the employee with regard to wages, hours, or any other terms and conditions of employment.

The Section 14(b) of the Taft-Hartley Act allows both states and union territories to enact legislation prohibiting union security arrangements. Accordingly, any individual will have the right to work in a bargaining unit that is represented by a union without joining the union or supporting the union financially.^[10]

LABOR–MANAGEMENT RIGHTS AND OBLIGATIONS

Collective bargaining is a psychological process in which each party (labor or management) tries to take advantage of the other by the use of statutory, contractual, and customary rules in fulfilling its enduring collective interests. These rules of bargaining influence the balance of power. Because of the sovereign nature of governmental authority and the enumeration of management rights in statutory law, the union as a protector of collective rights of the workers and maintaining the balance of power relies heavily on the mutually agreed-upon contractual provisions. These provisions are related to employee rights, grievances, procedures, and unfair labor practice(s). Employee unions also make use of the threat of strike or binding arbitration as potential means of maintaining balance of power. If this balance of power is lost significantly by the union, it may make the collective bargaining process less effective or redundant.

Employee Rights

Unions seek preservation of the balance of bargaining power by seeking incorporation of employee rights provisions in the labor–management relations statutes, contracts, ordinances, and agreements of understanding concluded between the labor and management in the public sector. These employees rights clauses normally stipulate that employees have rights to:

1. Form unions.
2. Join and assist unions.
3. Participate in good-faith collective bargaining.
4. Engage in lawful concerted bargaining activities or refrain from doing so.
5. Be represented by a union of their choice.
6. Maintain collective security.

There are several union security procedures available to employee unions. The management often prefers to negotiate an “open shop” arrangement, but unions normally prefer statutory language providing for a “union shop” through “dues check off” process, which allows unions to charge membership fees for representation.

Management Rights

In the public or private sector, management rights are either enumerated in the enabling

legislation^b or specified in the management rights clause in the contract. These rights are not free from mutual obligations. The careful analysis of labor–management rights reveals a balancing among management’s rights to manage, employees needs for security and fair treatment, union responsibility to the people, and the impact of these concerns on the collective bargaining process. For instance, the management rights specified in the state of Indiana, gives management authority to:

1. Manage and direct schools.
2. Direct work of employees.
3. Establish policy.
4. Hire, promote, demote, transfer, assign, and retain employees.
5. Discipline employees.
6. Maintain efficiency.
7. Relieve employees due to lack of work.

^bManagement Rights (*Source: Civil Service Reforms Act, 1978, Section 7106*):

- Subject to subsection (b) of this section, nothing in this chapter shall affect the authority of any management official of any agency—
 - to determine the mission, budget, organization, number of employees, and internal security practices of the agency; and
 - in accordance with applicable laws—
 - to hire, assign, direct, layoff, and retain employees in the agency, or to suspend, remove, reduce in grade or pay, or take other disciplinary action against such employees;
 - to assign work, to make determinations with respect to contracting out, and to determine the personnel by which agency operations shall be conducted;
 - with respect to filling positions, to make selections for appointments from—
 - ◇ among properly ranked and certified candidates for promotion; or
 - ◇ any other appropriate source; and
 - to take whatever actions may be necessary to carry out the agency mission during emergencies.
- Nothing in this section shall preclude any agency and any labor organization from negotiating—
 - at the election of the agency, on the numbers, types, and grades of employees or positions assigned to any organizational subdivision, work project, or tour of duty, or on the technology, methods, and means of performing work;
 - procedures which management officials of the agency will observe in exercising any authority under this section; or
 - appropriate arrangements for employees adversely affected by the exercise of any authority under this section by such management officials.

- Take actions necessary to carry out mission of schools.^c

Similarly, the city of Phoenix, Arizona, grants to its city manager the right to determine purpose of agency, set standards of service, exercise control and discretion, direct and discipline employees, and determine the means and personnel for carrying out operations. The state of Washington statute also carries a similar statement, specifying the scope of management rights by stating that management is required to carry out statutory goals using most appropriate means and personnel; manage employees; hire, fire, and transfer employees; establish work rules; and discipline employees.^[11] The enumeration of management rights either in the state statute or in the municipal ordinance demonstrates a remarkable similarity in specifying the nature and scope of managerial authority.

Toward Mutual Understanding

1. The history of labor-management relations demonstrates that the authoritarian or autocratic managerial leadership style cannot succeed in anchoring its goals in an environment filled with mutual distrust, disrespect, suspicion, threat, reprisals, and coercive behavior. What is needed is an understanding based on mutual respect, trust, partnership, and cooperative leadership. The current practices involving participative management style, use of labor-management committees, and the consultative leadership process based on the cooperative and reform-oriented approach advocated by the federal labor relations program under the E.O. 12871, 1993.^[12] Consequently, it is important to recognize the symbiotic functional relationship between labor-management rights.

CONSTRAINTS ON MANAGEMENT RIGHTS

Since the adoption of labor-management programs in the state of Wisconsin in 1959, the comprehensive

labor-management policies have been established in more than two-thirds of the states over a period of 45 years. During this period, unions have grown in strength, maturity, and negotiating skills. The changing work environment has also led to significant changes in organizational structures, personnel policies, working conditions, scope of bargaining, employee training and development, work standards, and the health and safety of the workers. All these structural, functional, and policy changes have had a significant impact on “management rights” or “managerial authority.” The following factors have either directly or indirectly contributed to influencing the nature and scope of management rights in the public sector:

1. *Expanding scope of bargaining:* As a matter of strategy, unions prefer a wide range rather than a management seeking to narrow the scope of bargaining. Traditionally, the scope of bargaining included wages, hours of work, and working conditions. However, the scope of bargaining today has expanded well beyond the traditional boundaries. For instance, teachers have been able to bargain successfully to participate in policy and other institutional matters.^d
2. *Grievance procedures:* The provision grievance action is common in most statutory laws, administrative appeal procedures, and negotiated contracts. A grievance procedure gives the employee union or management an opportunity to complain or grieve against each other to redress or seek compliance to any violation of stipulated conditions specified in contractual agreements. The employee unions invoke grievance procedures more often than management involving the issues related to contract interpretation, enforcement of contractual provisions, and the tenure and conditions of employment. In general, the causes of grievances may be classified into three broad categories: 1) misunderstandings; 2) intentional violations; and 3) sympathetic grievances. However, the most

^cThe State of Indiana Statute, Act 75 (1.c.20, Sec. 1 *et seq.*, 1973), states:

1. manage and direct schools;
2. direct the work of employees;
3. establish policy;
4. hire, promote, demote, assign and retain employees;
5. discipline employees;
6. maintain efficiency;
7. relieve employees due to lack of work;
8. take actions necessary to carry out the mission of schools.

^dTypically, teachers have been more successful in broadening the scope of bargaining than any other occupational groups mainly because of their joint participation in management affairs of the organization. The following demonstrates the nature and scope of working conditions negotiated by the teachers as part of their collective bargaining agreements: 1) class size provisions; 2) the number and functions of teaching aids; 3) school calendar; 4) teacher representation on instructional policy committees; 5) teacher arbitration procedures; 6) special programs; 7) curriculum and grading criteria; 8) textbook selection and the allocation of federal grant money; 9) teaching methodologies and peer evaluation; 10) staff-pupil integration and day care facilities for employees; and 11) teacher participation in school site selection and student disciplinary procedures.

frequently arbitrated issues in government pertain to:

- a. discipline and discharge
- b. arbitrability
- c. just cause
- d. management rights
- e. past practice
- f. overtime
- g. reinstatement and reimbursement from suspension
- h. leaves of absence
- i. promotion
- j. union security
- k. disciplinary procedures and practices.^[13]

The nature and scope of the grieved issues listed above are suggestive of the fact that employee unions—through written or negotiated grievance procedures—have significantly influenced or created constraints on the effectiveness of management rights clauses incorporated in the collective bargaining contracts or agreements.

3. *Personnel practices*: Personnel practices pertaining to recruitment, selection, and testing were traditionally considered as part of management prerogatives. In some cases, unions have penetrated these traditional areas of management rights through their efforts to influence the determination or modification of job qualifications and position descriptions.^[14] Similarly, unions have also recognized the importance of employee training and development for career enhancement. They vigorously support special training needs of women and minorities. Consequently, the public policy on equal employment opportunity/affirmative action has also increased the influence of unions in managing human resources in public organizations.
4. *Merit systems and civil service rules*: To resolve issues or problems associated with partisan politics adversely affecting personnel practices in the United States, the government established the merit system to select, promote, retain, and reward public employees based on merit principles. A merit system also requires civil service rules and regulations that not only strengthen the hands of the management in certain ways, but they also constraint management rights through added security to union employees, based on such considerations as seniority, due process, equity and fairness, and the reduction or layoffs. The civil service system covers merit as well as non-merit appointments. It is possible that “a civil service system may or may not

contain a merit system, but a merit system is always part of a civil service system.”^[14]

5. *Unfair labor practice(s)*: The unions have also gained strength by grieving through the unfair labor practices (ULPs). A ULP involves the violation of any right granted to employees, unions, or employers by a collective bargaining law or contract.^c More specifically, a ULP constitutes: 1) employer violations of employee rights; 2) employer violations of union rights; 3) union violations of employer rights; and 4) union violations of employee rights. Remedies to ULPs normally include warnings or orders such as cease and desist, reinstatement by a regulatory administrative agency, back pay, and postwritten notices. The fear that either

^cULPs:

1. interfere, restrain or coerce employees”—interfere with, restrain, or coerce employees in or because of the exercise of their rights as guaranteed in the statute.
2. “dominate unions”—dominating or interfering with the formation, existence, or administration of any employee organization; making financial contributions to any employee organization.
3. “discriminate on account of union membership”—discriminating in regard to hire or tenure of employment or any term or condition of employment to encourage or discourage employees in the exercise of the fights guaranteed to them by the statute.
4. “discriminate on account of testimony”—discharging or otherwise discriminating against any employee for signing or filing an affidavit, petition, or complaint, or given any information or testimony, under the statute.
5. “refuse to bargain”—refusing to negotiate in good faith with the exclusive representative of the employees in an appropriate unit (or with the employer representative), or refusing to process grievances.
6. “interfere with employer choice of representative”—interfering with, restraining, or coercing a public employer in the selection of a representative for the purposes of negotiations or the adjustment of grievances.
7. “cause employer to commit an unfair labor practice”—coercing, intimidating, or inducing any officer or agent of the employer to engage in any practice with regard to its employees that would constitute ULP if undertaken by the officer or agent own initiative; or attempting to do so.
8. “violate collective bargaining agreement”—violating the provisions of any written agreement with respect to terms and conditions of employment affecting employees, including an agreement to arbitrate or accept the terms of an arbitration award, where previously the parties have agreed to accept such awards as final and binding upon them.
9. “strike”—the concerted failure to report for duty, the willful absence from one’s position, unauthorized holidays, sickness unsubstantiated by a physician’s statement, the stoppage of work or the abstinence in while or in part from the full, faithful, and proper performance of the duties of employment, for the purpose of inducing, influencing, or coercing a change in the conditions, compensation, rights, privileges, or obligations of employment.

party can subject the other to a charge of facing a ULP becomes a constraining factor.

TOWARD ESTABLISHING MANAGERIAL RESPONSIBILITY

The labor-management process emerging from the growing emphasis on the labor-management cooperation, mutuality of their rights and obligations, and partnership in managing public employer-employee relationship seem to be gradually moving toward decline of management rights affected by the demand of the unions to participate jointly in policy areas that were traditionally considered to be within the exclusive domain of the management. For instance, the development of personnel policies in such areas as evaluation guidelines, pay determination, advancement, recruitment practices, testing for substance abuse, and the health, safety, and welfare of the employees under the general rubric of the "terms and conditions of employment" now often requires union consultation. Consequently, the management may be tempted to devise a coping strategy to avoid frequent confrontation with unions. This kind of bureaucratic behavior or managerial behavior in government may raise a fundamental question: Are the legal definitions of management rights incorporated in the negotiated contracts or statutory provisions adequate to provide effective safeguards and incentives to manage? The answer to this question in the public labor relations literature is pointing to the display of an attitude on the part of the bureaucrats either to adopt a posture of "inaction" or "circumvention" of public policy caused by the failure to act or take appropriate action. The case in point is the failure of the university bureaucrats to enforce the Ohio State Teacher Retirement System (STRS-Ohio) regulations to protect the rights of its faculty members.^f The administrative bureaucracy at the university under consideration was

particularly deceptive. Similarly, in its initial stage, the STRS also failed to take appropriate corrective measure in a timely manner.^[15]

In the declining state of management rights and the changing work environment in the public sector, what is needed is to safeguard the legally defined management rights and augment them by an ethical component so that the "public interest" is fully protected. The evolving cooperative leadership can help to a certain degree in promoting labor-management harmony, but it cannot guarantee an ethical correctness of mutual obligations. What is needed is to establish the process of managerial responsibility that is based on mutual respect, obligations, and ethical integrity and responsibility.

CONCLUSION

The evolving emphasis on labor-management cooperation and partnership is sound, but the attitude of management to keep the unions out of its domain of influence and legal authority may lead to some uneasy partnerships. Any public labor-management relations program dealing with management rights or prerogatives must focus on maintaining proper balance between the incentive to manage and protecting the health, safety, and welfare of the employees. In the twenty-first century, the evolving realities in the general socioeconomic and work environment, as well as the changing nature of employer-employee relationship, will require significant adjustments in values, attitudes, and behaviors of both labor and management. The forces of change in these areas may lead to modification or replacement of such old administrative values as "sovereign authority," "efficiency," "economy," and "productivity," by mutual respect, cooperation, integrity, responsiveness, and administrative responsibility. In the future, it is expected that the discussion of issues relating to legal and ethical responsibilities of public administrators will dominate the public policy agenda covering management rights.

The survival of management in the collective bargaining process will depend on management's ability to retain its managerial authority through management rights clauses in the collective bargaining agreements, statutory laws, ordinances, and legal opinions. The management may still retain the right to hire, fire, discipline employees, and administer agency programs, but unions will continue to exert their demand to participate in policy-making and implementation aspects in these areas. Historically, the fundamental question in labor laws has been how to arrive at a balance between the rights of workers and employers that provide for "equity, economic stability, and procedural workability."^[10] What degree of control

^fThe STRS case study deals with the coverup of initial failure of university bureaucrats to carry out their responsibilities and the reluctance of STRS-Ohio to investigate and bring criminal charges against university officials to collect a large sum due to the retirement system. The STRS rules and the state law requires that a person who takes an early retirement cannot return to teaching within 2 months without forfeiting a month's pay for each month taught prior to the 2 months' limitation. The STRS has oversight responsibility for the entire program. The 1968 case highlights the failure of the university officials, STRS bureaucrats, and other public agencies responsible to execute state laws and regulatory policies established by the STRS to protect all retirees who have contributed to the system. The author of this case study raises an important issue about the failure of the bureaucrats running the system to carry out legal obligations and demonstrate the moral and ethical responsibilities to the public contributors and retirees of the STRS-Ohio. *Source*: V. Jerone Stephens, "The Smashed Model of Bureaucratic Behavior: The Way the Process Works to Aid Bureaucratic Irresponsibility," research paper prepared for delivery at the OAEPS, 2001.

has management retained, and what rights has it surrendered since the collective bargaining came to the public sector? There is no clearcut answer to this question because the situation significantly varies in the state and local government characterized by impressionistic statements.^[13]

Collective bargaining procedures require that administrators deal formally with their bureaucracies and negotiate on hosts of issues. Union's seek to insert contract provisions related to personnel policies, including job descriptions, position classification, work schedules, examination and promotion procedures, recruitment policies, and training programs. Many decisions long regarded by public employers as part of management's prerogative have become bargainable issues.

The issues related to organizational justice, workplace violence, acquired immune deficiency syndrome, smoke-free work environment, drug abuse testing, child/elder care, alternative lifestyles (same-sex relationships), flexible staffing, flexible location (flexplace), and romantic behavior/sexual harassment in the workplace will have significant impact on management's rights and legitimate authority to establish the required policies, procedures, and regulations. Certainly, unions also want to participate and share management's authority to regulate in these areas. Undoubtedly, collective bargaining has brought a new force into the decision-making process. As a partner in a bilateral decision-making process, management must be able to defend its decisions and be prepared for new challenges.^[16]

Lao People's Democratic Republic (PDR)

Clay Wescott

*Government and Regional Cooperation Division, Asian Development Bank (ADB),
Manila, Philippines*

INTRODUCTION

The governance system in Lao People's Democratic Republic (PDR) has evolved from key historical events, in the context of a number of geographical factors such as being landlocked, mountainous, and thinly populated, with ethnically diverse people living in small, isolated villages. Although the poorest Association of Southeast Asian Nations (ASEAN) country, Lao PDR has seen modest improvements since the early 1990s due to market-oriented reforms and improved institutions.^[1]

BACKGROUND

The fourteenth-century kingdom of Lan Xang broke up into three separate kingdoms in the late eighteenth century, and, some 100 years later, France took control and combined them under the rule of the royal house of Luang Prabang. With the exception of a brief period of Japanese control in World War II, French colonial rule continued until 1954. The Lao People's Party, later the Lao People's Revolutionary Party (LPRP), linked with the Pathet Lao resistance movement, established in 1955 under the leadership of Kaysone Phomvihane. In the 1960s, Laos, under the U.S.-supported government of Prince Souvanna Phouma, was subjected to heavy bombing as the United States sought to hinder the passage of North Vietnamese soldiers and supplies along the Ho Chi Minh Trail.

The Lao PDR was proclaimed in 1975. Prince Souphanouvong was named president, but the real power lay with Kaysone Phomvihane, secretary general of the LPRP. The new government faced severe challenges in the aftermath of 20 years of political struggle, civil war, and bombing; the emigration of skilled administrators and professionals; and a Thai economic blockade from 1975 to 1976. As many as 40,000 people were sent to reeducation camps, and anywhere from 30,000 to 160,000 were imprisoned for "political crimes." The former king, Savang Vatthana, had initially been assigned the position of supreme adviser to the president, but in 1977, Savang Vatthana was banished to a remote area of the country. Prince

Souvanna Phouma was allowed to live quietly in Vientiane until his death in January 1984.

Attempts to collectivize agriculture encountered strong opposition, and production stagnated. The LPRP took the first steps toward market-oriented reforms in 1979 by easing restrictions on private trade and encouraging joint ventures between the state and the private sector. It reduced agricultural taxes and increased government procurement prices for most crops; however, it made no move to dismantle central planning.

More far-reaching reforms began in 1986 following the adoption of the New Economic Mechanism (NEM). The government abandoned the collectivization of agriculture, eased many restrictions on private sector activity, and gave state enterprises more decision-making power. By 1989, most political prisoners had been released and the camps had been closed. The number of state-owned enterprises (SOEs) was reduced from more than 800 in the early 1990s to about 90.

THE PUBLIC SECTOR

Although the 1991 constitution contains elements of an earlier revolutionary orthodoxy, it emphasizes that the economy is market-oriented, permits private property and all forms of economic ownership, and protects religious, gender, and ethnic rights. The constitution legally establishes executive, legislative, and judicial branches of government, whereas the leading role of the party is assured.

With about 65,000 members, the LPRP's highest authority is the Party Congress, a gathering of party cadres who meet to ratify decisions already taken by the party leadership. Next in the party hierarchy is the Central Committee—59 party elites who fill key political positions and lead the party between congresses, which are held every 5 years. The Central Committee is headed by the nine-member Politburo.

The LPRP has shown itself to be remarkably resilient. Transitions of power have tended to be smooth, the new generation of leaders has proven to be more open to reform, the Politburo has some ethnic diversity, and organized opposition is weak. Some improvements

have been evident since the early 1990s in literacy, primary education for girls, and reduction of child mortality, malnutrition, and poverty.

The central government consists of 16 ministries and equivalent organizations, down from 32 after the 1986 NEM reforms. The National Assembly elects the president for a 5-year term. The Council of Ministers is the highest executive body and includes the prime minister and three deputy prime ministers. There is also a vice president. None of the key political and government leaders is a woman; however, there are four women members of the 59-member Central Party Committee: three female vice ministers and one woman governor. When assessing Lao politics, it is important to distinguish between the formal political structure and the informal networks through which much of the decision making takes place. Nepotism and patronage are endemic within the party and the bureaucratic system. The lack of transparency makes it difficult for the majority of the population or outside observers to understand the political decision-making process.

Since a border conflict with Thailand in 1987, Lao PDR has been at peace with its neighbors. However, the Lao People's Army still maintains a regular armed force of 29,100 and a local militia of around 100,000. In addition, the military remains politically powerful: only two of the nine-member Politburo have no military background. Although the military is regarded as politically conservative, it has exploited the nexus between its powerful position and the opportunities provided by economic reform. At the heart of the military's commercial empire is the Import-Export Company, whose diverse activities include agriculture and forestry, construction, light industry, trade, and tourism. Yet for most soldiers, army life is austere. Pay is low, and uniforms and equipment are in short supply. Consequently, most young Laotian men serve only the minimum term after being drafted.

From 1975 until the early 1990s, Lao PDR relied heavily on Vietnamese and Soviet military aids. Once the internal security threat from resistance groups had been reduced and relations with the country's neighbors had improved by the early 1990s, the leadership was able to reduce the defense budget and, as of mid-1994, Lao PDR had the smallest defense budget in Southeast Asia.

Lao PDR is, at best, at the very beginning of democracy. The National Assembly is elected every 5 years. It currently has 109 members (25 of them women), and generally meets twice a year. There is ongoing work with donor support to promote debate, use secret ballots, televise sessions, and improve public consultation, legislative drafting, and floor deliberation processes. Between sessions, the Standing Committee of the National Assembly, consisting of the president, vice president, and an unspecified number of other members,

prepares for future sessions and oversees activities of the administrative and judicial organizations.

Lao PDR is divided into 16 provinces, 112 districts, and more than 11,000 villages, yet there has been little real devolution of power. Most members of the government are members of the LPRP, and the party-controlled Lao Front for National Reconstruction must approve those who stand for election to the National Assembly. The present National Assembly includes only one non-party member.

Relations between Lao PDR and neighboring countries are cordial, in part the result of membership in regional groupings such as the Greater Mekong Subregion (GMS) and ASEAN. Despite its economic problems, Lao PDR has continued to take steps to meet tariff reduction targets to comply with ASEAN Free Trade Area commitments.

The civil service has about 90,000 employees (38% are women),^[2] along with roughly the same number of other workers paid by the government but not part of the civil service, including the military. Although the official size and cost of government are less than for regional comparators, these figures may understate the actual size and cost due to weak information systems. Over four-fifths of civil servants work in provincial governments. Inflation has eroded the value of wages to the point that they are well below the minimum needed for food and basic necessities, despite a 20% wage increase in 2002.^[3] Operating budgets are minimal. As a result, many civil servants lack the motivation to perform their jobs effectively. Low skill levels exacerbate this problem, along with recruitment and promotion based on factors other than merit, and frequent marginalization of talented staff through transfers and assignment to low-priority tasks. Job descriptions are only now being introduced and there is little clarification of roles and responsibilities. The civil service tradition is strongly top-down, and the staff are reluctant to make decisions or bring problems to their superiors' attention. Exchange of information is limited.

In 1991, the government established the National School of Administration and Management to train civil servants. It also created the Department of Public Administration and Civil Service in 1992, which is responsible for guidelines and policy issues. The Central Committee for Organization and Personnel appoints and manages staff at the director level and higher. Although there have been ongoing efforts supported by donors to address administrative weaknesses, progress remains slow.

Lao PDR is a member of the International Monetary Fund (IMF), which in 1998 laid down an international code for public financial management. The code covers four broad requirements: clarity of roles and responsibilities; public availability of information; open budget

preparation, execution, and reporting; and independent assurances of integrity. The government has made some progress in moving toward these requirements.

The constitution requires the National Assembly to approve both the budget and the development plan, but contrary to the code, the National Assembly does not receive detailed information on the budget. There is also no indication that the National Assembly approves or reviews extrabudgetary spending, quasi-fiscal activities, or government equity holdings.

Lao PDR has made some progress toward complying with the code's requirement for public availability of information. Although increasingly detailed budget information has been released to the public since 1997, there are serious delays in publication, and no coverage of contingent liabilities, tax exemptions, and other required elements.

As concerns independent assurances of integrity, government accounts are incomplete, inconsistent, and difficult to comprehend, and there is no independent audit authority. The National Audit Office is under the Office of the Prime Minister; thus it is not in compliance with the minimum standard of independence.

On the revenue side, the government has introduced a number of fiscal reforms intended to reduce the budget deficit and inflation. A key aim has been to shift the revenue base away from a dependence on transfers from state enterprises toward income, property, excise, and trade taxes. As a result, revenue has gone up as a percentage of gross domestic product (GDP): from 10.6% in 1999 to 14.5% in 2002.^[3,4]

The IMF's code also calls for the administrative application of tax laws to be subject to procedural safeguards. Various reforms have reportedly improved the filing rate from 30% to 80%, and have increased collections significantly. Customs procedures and clearance times have also improved, although customs revenues have not, probably because of low valuations of imported goods, smuggling, and tariff reductions required by ASEAN.

Weaknesses in public administration and financial management lead to problems in service delivery. For example, the country suffers from a shortage of schools and textbooks, poorly qualified teachers, and low enrollment and completion levels. Although educational expenditures have increased since the mid-1980s to 7.4% of the budget, with significant donor-funded investments, the amount would need to increase to around 15% to meet stated goals.^[4]

Health standards are also lower than desired due, in part, to a weak public health system that is inaccessible to much of the population. Many poor people rely on private pharmacies that have sprung up in recent years for treatment, but their personnel are often inadequately trained. A positive sign is that government

health expenditure increased from 2.5% in 1992 to 5.6% in 2001/2002, although this combines a sharp increase in the donor-funded capital budget with cutbacks in the recurrent budget. Overall, the budget remains heavily skewed toward capital rather than recurrent expenditure.

The government has initiated important reforms in the area of central-local government relationships. Fiscal and planning responsibilities were centralized in the 1990s, and then selectively transferred back to local authorities by decree in 2000, allegedly to speed up project implementation.^[5]

Past and present decentralization efforts face challenges because of unclear legal and regulatory framework and enforcement, lack of capacity at the provincial level, weak central institutions, and poor communication and transport links. The lack of accountability of subnational authorities and an effective and transparent system of fiscal decentralization has reduced the transfer of tax revenues to the center. The economic gap between Vientiane and the rest of the country has widened since the reforms began, as most investments have gone to the capital and its environs.

Legal and judicial reforms began in 1989. A draft criminal code established procedures for criminal cases, set up a court system, and established a law school. The Supreme People's Court is now responsible for judicial appointments. Laws are published in the Official Gazette, but only for limited distribution each quarter.^[2] The Ministry of Justice routinely publishes its decrees and those of other ministries it deems important. This leads to confusion in the application of unpublished decrees and arbitrary enforcement.

Access to justice is hindered by shortages of qualified judges and facilities, and administrative interference in judicial decisions. Outside of major urban centers, citizens rely on village-based conflict resolution committees to adjudicate disputes. Based on traditional systems, these parajudicial elected bodies relieve the underresourced civil courts of civil complaints.^[2]

A key governance constraint is corruption at all levels. New opportunities for corruption opened up as economic reforms started to take hold in the 1980s. For example, giving provinces the right to trade directly with neighboring countries has opened the way for trade-related graft; the opening up to foreign investment has introduced opportunities to collect money to facilitate required authorizations. The enhanced political and economic roles given to the army have provided new opportunities for smuggling. Corruption also spread to personnel management, leading to the rapid promotion of those close to powerful leaders. Donor-funded procurements are commonly abused for personal gain. There are also reportedly 4–10% kickbacks paid for government contracts.^[2]

The government has taken many actions to address the problem, adopting an Anti-Corruption Decree in 1999 and new directives at the Party Congress in 2002, placing new controls on illegal logging, publicly condemning lavish consumption, and strengthening the State Audit Authority, State Inspection Authority, and Inspection Department of the Ministry of Finance.

PRIVATE SECTOR, CIVIL SOCIETY, AND THE MEDIA

The private sector consists mainly of small family trading and food-related businesses, about 75% in rural areas. Although the government still views the emerging private sector—especially indigenous entrepreneurs—with suspicion, many initiatives are underway with donor support to improve the enabling and regulatory environment.

The National Chamber of Commerce and Industry represents 500 businesses, but still depends on party guidance. The party's mass organizations have extensive networks at the village level, and some accomplishments that point to, for example, the Lao Federation of Trade Unions have promoted the rights of textile workers and HIV/AIDS prevention as a right of all workers.

There are only a few indigenous organizations that might be viewed as the beginnings of an independent civil society. Nevertheless, there are increasing numbers of Laotian non-governmental organizations (NGOs) working at the village level (e.g., Champa works on health issues and Padek Lao works on community-based agricultural issues). Foreign NGOs have developed further than indigenous ones because the government finds them easier to control.

Information and communication have been tightly controlled since French colonial times. During the years of revolutionary struggle, the LPRP relied heavily on radio broadcasts to a largely illiterate, mountain-dwelling audience. In recent years, the number of newspapers, televisions, and radio stations has increased. The government still controls all domestic radio, television, and newspaper outlets, and reacts harshly to

expressions of political dissent. Despite government controls, the quality of reporting and scope of topics covered is increasing.^[2]

Given the proximity of Thai radios and televisions, Thailand remains both an open window to a different economic system and provides an alternative perspective on the news. Satellite and cable broadcasting and the Internet are legal and progressively reducing government monopoly control of the media.

CONCLUSION

The resilient party and government apparatus that inherited the historical legacy and geographical constraints of Lao PDR has come a long way from its initial socialist orthodoxy to the nascent constitutionalism and market mechanisms of today. Yet Lao PDR is still a long way from operating as a modern constitutional state based on a clear separation of powers, and further reform will be required for Laos to meet its ambitious goals of poverty reduction, social development, and economic development.

Law and Ethics

John A. Rohr

Center for Public Administration and Policy, Virginia Polytechnic Institute,
Blacksburg, Virginia, U.S.A.

INTRODUCTION

This article has two major sections: 1) theory and 2) practice. The second section is subdivided into: a) law as command; b) law as empowerment; and c) comparative law.

THEORY

At the most general level, questions of law and ethics are matters of jurisprudence, or the philosophy of law. Here the most fundamental issue is the perennial debate between adherents to the natural law theory, on the one hand, and legal positivists on the other. The former hold that to be valid, a law must somehow conform to a moral order in the universe, or a “higher law,” whereas the latter consider law to be a duly enacted command of the state regardless of its moral value. Martin Luther King’s famous “Letter from a Birmingham Jail,” wherein he argued that segregation laws in the southern states were not laws at all because they were unjust, provides an excellent example of a modern author calling upon a legal tradition that reaches back through the High Middle Ages to the ancient Stoics of classical antiquity. The nineteenth-century British philosopher, John Austin, is usually considered the most important legal positivist, especially because of his important contributions to analytic jurisprudence, which treats a law as simply a fact regardless of its history or morality and seeks to clarify its meaning by a variety of rigorous analytical methods.

When questions of legal philosophy are applied to practical human affairs, both the natural law adherents and the positivists encounter certain long-standing difficulties. During the second half of the twentieth century, positivists were regularly embarrassed by the criticism that they have no principled basis for acknowledging the evil of Hitler’s anti-Semitic measures because they were, after all, commands of the German state and therefore entitled to obedience by the German people. The positivist knows no higher law to stand in moral judgment on duly enacted laws of the state.

The natural law school has difficulty explaining the content of the moral order of the universe to which the laws of the state should conform. Significantly, Saint Thomas Aquinas, the most prominent advocate of the natural law position, was always quite circumspect in expressing specific applications of such broad natural law principles as *bonum faciendum*, *malum vitandum*—good is to be done and evil to be avoided.

Writing in the thirteenth century, Aquinas, for all his brilliance, did not go unchallenged. The great medieval debate on the relation between law and morality is nicely summarized in the query, *Estne prohibitum quia malum aut malum quia prohibitum*? That is, is a particular form of behavior prohibited because it is evil or is it evil because it is prohibited? The medieval debate extended to strictly religious questions when learned theologians puzzled over the jurisprudential implications of certain aspects of the Decalogue. When the Lord commands that the Sabbath be kept holy, is He commanding in the same way as when He bids the faithful not to kill. Isn’t killing *inherently* evil regardless of whether the Lord has explicitly forbidden it? Is it not prohibited because it is evil—*prohibitum quia malum*? On the other hand, there seems to be nothing inherently sacred about the seventh day. Surely the Lord could have commanded that the fifth or the tenth day be kept holy as easily as the seventh. To violate the Sabbath is not evil in itself; it is evil because it is prohibited—*malum quia prohibitum*.

The current debate over abortion provides an interesting contemporary glimpse of the natural law tradition in action. Pro-choice advocates argue that extremely restrictive abortion laws violate the higher law that empowers a woman to use her body as she sees fit, especially in matters as intimate and personal as childbearing. Pro-life groups argue that permissive abortion laws violate the higher law that protects the life of innocent human beings, in this case the developing fetus.

The abortion debate is particularly illuminating because it spans the divide between two related but very different moral traditions—natural law and natural rights. As noted above, the natural-law tradition affirms a certain moral order in the universe that human beings ignore at their peril. Its origins are both

ancient and medieval. The natural rights tradition is modern, tracing its origin to the “state of nature” postulated by Hobbes and Locke, wherein all persons enjoy certain natural rights without any reference to an overarching universal moral order.

Not surprisingly, the abortion debate pays little heed to such fine academic distinctions. Pro-choice advocates and their pro-life adversaries are practical men and women, far more interested in seeing their cause prevail than in the pedigree of their arguments. Nevertheless, in making these very arguments, they unwittingly speak the lines that were written centuries ago. They cannot help doing so because the effort to define the relationship between law and morality is profoundly and abidingly human.

PRACTICE

Law as Command

Ordinarily, one thinks of laws as issuing commands—stop at the red light, pay your taxes, register for the draft, etc. In the domain of public service ethics, the most important laws commanding certain actions focus on avoiding conflicts of interest and filing accurate financial disclosure statements. Statutes, administrative regulations, and municipal ordinances addressing such matters can be found at all levels of government, but the most fully developed system is found at the federal level where a specific agency, the Office of Government Ethics (OGE), has been created to enforce laws and regulations pertaining to ethics in the executive branch.

The Ethics in Government Act of 1978 established OGE and tasked it with enforcing new ethical standards legislated by Congress in the aftermath of the Watergate scandal. When Jimmy Carter ran for president in 1976, Watergate was fresh in everyone’s memory. Not surprisingly, candidate Carter promised that, if elected, he would see to it that Congress passed a new ethics law. Congress honored this pledge with the Ethics in Government Act of 1978. Interestingly, however, the new legislation focused almost exclusively on avoiding or correcting financial irregularities, whereas the Watergate crimes were primarily concerned with abuses of power. It is difficult to imagine just how the Watergate events would have turned out differently if John Dean, Gordon Liddy, and John Ehrlichmann had been required to file financial disclosure statements. To the extent that law commands, one can surmise that Congress found it easier to legislate sweeping financial disclosure statements than to address the more subtle problems of abuse of power, a matter unlikely to be found amenable to statutory commands.

Many prohibitions against conflicts of interest had been in place long before 1978. For example, Congress had already prohibited government officials from participating in matters in which they had a financial interest and receiving supplements to their salaries from non-governmental sources. A striking innovation in the 1978 legislation, however, was the imposition of certain postemployment restrictions on officials about to leave government service. The duration and severity of these restrictions varied with the proximity of the connection between the work the official had done in government and the type of work he or she planned to take up in the private sector. These strict regulations were sanctioned with criminal penalties.

A major theme in the conflict of interest area is the importance of avoiding appearances of impropriety. Financial disclosure regulations are intended to detect and deter such appearances. The concern with appearance is intended to bolster the confidence of American citizens in the integrity of those who govern them. This is brought about by imposing a “Caesar’s wife” standard upon public servants.

Law as Empowerment

Not all laws command; some of them empower certain citizens to take certain actions on behalf of the state. For example, as far back as 1906, Congress empowered officials of the Bureau of Chemistry, the forerunner of today’s Food and Drug Administration, to regulate “substandard food” and “impure drugs.” Such vague directives conferred considerable discretionary authority upon administrators to govern substantial segments of American life. The same can be said for the congressional authorization to the Federal Trade Commission in 1914 to prevent “unfair competition.” Similarly, congressional enactments empowering the Federal Communications Commission to grant radio and television licenses as the “public interest, convenience, or necessity” will indicate and the Securities and Exchange Commission to maintain a “fair and orderly market” are steps down the same road. That road has led to a mature administrative state that is characterized by the salience of policy making by civil servants—both politically appointed and career professionals—in significant areas of American life. These administrative powers are grounded in statutes that do not command but rather empower administrators to share in governing the republic.

This empowerment of the bureaucracy creates an ethical problem for those so empowered. Conventional democratic theory requires that those who govern should be chosen by the people, but civil servants are not elected and, indeed, most of them are career personnel whose positions are secure regardless of

electoral results. The ethical problem for the conscientious civil servant is to devise a principled basis for exercising his or her discretionary power in a manner consistent with the exigencies of a constitutional republic.

Over a century ago, civil service reformers tried to avoid the political and ethical implications of a merit system of personnel selection by drawing a sharp distinction—indeed a dichotomy—between politics and administration, assigning politics to elected officials who make policy and administration to civil servants who simply do the bidding of their political masters. This effort to remove administrators from politics could not withstand serious analysis, and by the middle of the twentieth century, it was abundantly clear to all and sundry that statutory law empowers non-elected civil servants to play a significant role in governing the United States. This is an ethical problem of the highest order because non-elected officials share in governing a democratic society. For the past quarter century, scholars and practitioners of public administration have looked for suitable standards to guide civil servants in the exercise of their governing power without notable success.

Comparative Law

American administrators are not alone in exercising powers of governance without being subject to the discipline of the ballot box. The exercise of such powers is a hallmark of the modern administrative state. In the United States, one of the principal checks against administrators who use their discretionary powers unethically comes from the remarkably strong American judiciary, at both the state and federal levels. Not only can American judges nullify administrative actions that go beyond an agency's statutory powers, but they can also declare unconstitutional the very statutes that empowered administrators to act in the first place.

The ordinary courts in Great Britain and France have no such power, but these nations are by no means without institutional resources to control overly zealous administrators.

In the United Kingdom, the courts curb administrative excesses by relying on the principle of *ultra vires*, that is, the principle forbidding ministries and other executive agencies from taking actions beyond those authorized by the act of Parliament or the Order in Council grounding the particular administrative action in question. Ordinarily, British courts invoke this doctrine by measuring a challenged administrative action against specific statutory language. British courts have gone further, however, by presuming that Parliament never intends to authorize abuses, and, therefore, they

have held that safeguards against abuse must be *implied* in every statute they construe. In other words, British courts compensate for their lack of power to declare an act of Parliament unconstitutional by reading into statutes a principle safeguarding against abuse by administrators who use their statutory powers in an unethical or irresponsible manner. No statute is declared unconstitutional but the abusive administrative action is found to violate the implied meaning of the statute itself.

British courts achieve a similar result by invoking the closely related principle of “natural justice,” which they maintain is also implied in acts of Parliament. Its most important function is to require administrators to grant a fair hearing before imposing an adverse administrative action upon a British subject regardless of whether the statute authorizing the action required such a hearing. This principle has been applied in such routine matters as removing a company's name from a list of approved contractors or denying a petition for discharge from a mental institution.

When administrative abuses in such matters occur in the United States, the legal challenge ordinarily focuses on the Fifth and Fourteenth Amendments, as well as the specific statute authorizing the action in question. Since British courts cannot void a statute on constitutional grounds, they curb irresponsible bureaucratic behavior by reading into the statute or Order in Council legal principles that American judges would consider constitutional guarantees of due process of law.

The ordinary courts in France, like their British counterparts, have no power to declare statutes passed by the French Parliament unconstitutional. The French, however, follow a different path toward curtailing administrative abuse. Prior to the present French Constitution of 1958, there was no way that any act of Parliament could be declared unconstitutional regardless of how flagrantly unconstitutional it might be. The Constitution of the Fifth Republic changed all this by creating the Constitutional Council, which was empowered to void acts of Parliament. This council, however, is not a court; no litigants appear before it. Its jurisdiction is invoked only by officials displeased with an act of Parliament they consider unconstitutional. The jurisdiction of the Constitutional Council addresses parliamentary rather than administrative abuses.

Because of the extraordinary power of the French bureaucracy, a special jurisdiction developed within the Council of State—originally an advisory body to Napoleon—to adjudicate claims by French citizens that they have been mistreated by administrators. When councilors of state sit as an administrative court, they exercise a judicial power totally independent of the ordinary French courts where routine

civil and criminal cases are heard. There is no appeal to a higher court from a decision of the Council of State. Councilors of state are themselves civil servants, which might suggest a certain bias on their part against aggrieved citizens. Such, however, is not the case. For well over a century, the Council of State has developed a solid body of legal principles that protect French citizens against abusive and unethical behavior on the part of French administrators. Today the Council of State's reputation for fairness has made it one of the most prestigious institutions in France, thereby providing empirical evidence to support the proposition that one administrative institution is quite

capable of encouraging ethical behavior in other such institutions.

Leadership

Thomas W. Kent

*Department of Management and Entrepreneurship, College of Charleston,
Charleston, South Carolina, U.S.A.*

INTRODUCTION

There have been a number of studies conducted in the United States on behavioral factors associated with transformational leadership. These studies have attempted to identify the behaviors that comprise what Burns described as “transforming leadership.”^[1] Burns believed that the process of leadership changed both leader and follower. It affected, positively, the morals, ethics, and attitudes of both leader and follower. These personal changes occurring within individuals then instigate changes in organizations, according to Burns. This conceptualization of leading was, at the time, a far cry from the popular scholarly thought that leadership was made up of two types of activities. One type brought about the structure an organization or team needed to succeed (initiating structure); the second type exercised concern for the populace of the organization or team (consideration). Since Burns’ identification of this new concept of leadership, the question became what comprises this transforming leadership? What does a transforming leader look like in action? What does the transforming leader do to transform organizations and teams? This, then, led to the attempts to identify the behavioral components of transforming leadership.

The earliest attempts to identify these factors were made by Bass and his associates.^[2–5] Bass went on to develop a questionnaire (called the Multifactor Leadership Questionnaire or MLQ) that purported to measure and define transformational leadership (notice that Bass used the word transformational and not transformation or transforming leadership as Burns called it). In his studies, Bass found four factors related to transformational leadership. They were idealized influence—related to trust and faith in the leader, individualized consideration—related to the personal attention the leader gives an individual, intellectual stimulation—related to engendering creativity and innovation within followers, and inspirational leadership—related to creating vision. Later, Yammarino and Bass, in a study of military officers, changed idealized influence to charisma.^[6] Kouzes and Posner factor analyzed statements based on leaders’ experiences of their performance.^[7,8] They found five factors: challenging the process—related to experimenting and

taking risks; inspiring a shared vision—related to creating a vision and enlisting support of it; enabling others to act—related to fostering collaboration among others; modeling the way—related to setting an example; and encouraging the heart—related to recognizing performance of others.

Similarly, Kent, Crotts, and Aziz using SPSS, factor analyzed behavioral descriptions of leaders’ performance and developed four factors.^[9] A reanalysis of the data using LISREL confirmed the original four factors plus a fifth factor.^[10] These factors were visualizing greatness—which is related to creating an inspiring vision, empowering the “we”—which is related to strengthening, and identifying with, a unit (such as a team or an organization), communicating for meaning—which describes deep-level transactions between follower and leader, managing one’s self—pertaining to the leader’s skill at self-direction and control, and care and recognition—which is related to giving attention to followers’ effort and success. These ideas have been widely studied among North American managers and are fairly well accepted among both the scholarly and the professional communities. But do the ideas apply globally to all or most cultures? For example, the leadership function of “Empowering the ‘We’” is very much team oriented or focuses on the collective body. That notion may apply to team-oriented societies, but is it employed by leaders in more individualistic cultures? This chapter will explore that question by reviewing the findings of studies that sought to answer the question.

DEFINITION OF TRANSFORMATIONAL LEADERSHIP

Kent attempted to differentiate between the concepts of leadership and of management explaining that, at the time, there seemed to be confusion among both practitioners and scholars between the two concepts.^[11] Kent’s definition of transformational leadership included descriptions of the purpose, products, and processes of leading.

The purpose of leading according to him is to create direction and the unified will (among followers) to

pursue it through the development of peoples' thinking and valuing.

Leading's products include: 1) the establishment of thrust or purposeful energy toward a purpose, goal, or end; 2) the creation of social orderliness—as opposed to disarray or group chaos—to carry out that thrust; and 3) higher states of behavior in terms of principles, values, morality, and ethics—among both leader and followers.

The processes (or methods) of leadership—these would be categories or groupings of leadership behaviors—are: 1) empowering the “we”; 2) visualizing greatness; 3) managing ones' Self; 4) communicating for meaning; and 5) caring and recognition. These are the same five factors discovered by Kent, Crotts, and Aziz and Kent.^[9,10]

The question for this chapter is: Does this definition apply outside the boundaries of the United States and Canada? Berry and also Douglas and Nijssen warn against imposing culturally specific values, concepts, and language into the research process, by taking ideas and research tools developed in one culture and using them in the study of another culture, without insuring the reliability and validity of the concepts and tools within the second culture.^[12,13] Since most of the above research dedicated to discovering the behaviors that leaders employ was conducted on U.S. managers, this warning should apply when applying the concepts of transformational leadership to other cultures.

Berry proposes a number of steps to reduce the possibility of or the impact of a researcher imposing his or her concepts, instruments, or behaviors onto the subjects from another culture via his or her research techniques and tools—what he calls an “imposed etc.” He describes the importance of demonstrating *equivalence*—as far as the research goes—between the cultures under study. According to Berry, it is important to establish functional, conceptual, and metric equivalence. Functional equivalence is related to insuring the behaviors in question—the behaviors being studied serve the same purpose in the cultures in question. Conceptual equivalence involves taking steps to assure that the concepts and research tools possess similar meaning among the cultures involved in the study. Metric equivalence applies to the results of the study. Statistical and procedural steps should be taken to ensure that both the instruments and the results provide a valid basis for comparison between or among cultures.

Douglas and Nijssen describe the equivalence required for cross-cultural research as scalar, construct, and measurement unit equivalences. There are similarities between Berry's and Douglas and Nijssen's two sets of three equivalences. Scalar equivalence implies that steps be taken to insure that the responses to an instrument within a study have the same meaning

and interpretation. Construct equivalence is assured when concepts occur in, and have the same meaning across, cultures. Measurement unit equivalence requires that the units of measurement be translated to common units such as when comparing two economies and the local currencies are translated to a common currency.

This chapter will review a few of the studies that have attempted to measure the equivalence of transformational leadership concepts across cultures and national boundaries.

INTERNATIONAL STUDIES

Perhaps, the largest and most globally comprehensive study of the subject in recent years has been The Global Leadership and Organizational Behavior Effectiveness (GLOBE) Research Program. This program tested the hypothesis that transformational leadership was basically similar in 62 cultures.^[14] This massive study, which involved 170 investigators, attempted to investigate the relationships between societal cultures, organizational cultures, and transformational leadership. While they found many culturally specific leadership behaviors (behaviors that facilitated effective leadership in one culture but not in others), their primary finding was that behaviors normally associated with transformational behavior were strongly and universally endorsed across cultures.

In the GLOBE study, middle managers from each of the cultures were asked if specific leadership behaviors contributed to or inhibited effective leadership. The researchers' main hypothesis was that charismatic/transformational behaviors would be universally endorsed as contributing to effective leadership. This hypothesis was soundly supported by the study, indicating that transformational leadership behaviors are culturally endorsed in all cultures included in the study.

It is suggested that the GLOBE study established functional or scalar equivalence regarding the overall idea of transformational leadership among several international cultures, including the cultures involved in this study.

The GLOBE study did neither study actual behaviors of leaders nor the relationship of actual transformational leadership behaviors to organizational performance. Quesada, Gonsales, and Kent^[15] measured actual leader behaviors in Costa Rica and in Spain vs. the behaviors of leaders in the United States using instrument developed by Kent.^[10] The Quesada et al. study satisfied the requirements of both scalar and construct equivalence and measured actual behaviors as reported by subordinates (followers) of the leaders. This study found support for four of the five

leadership processes described in Kent's definition of transformational leadership.^[11] Care and recognition was the one factor that did not "translate" to both Spanish-speaking countries included in the study. Interestingly, that is the one factor that was not found in the original factor analysis by Kent, Crotts, and Aziz.^[9]

CONCLUSION

There is sufficient research on the international equivalence of transformational leadership to suggest that the idea is not bounded by cultural or national boundaries. The GLOBE study confirmed the international transference of the values associated with transformational leadership, and the Quesada, Gonsales, and Kent study supports the idea of an internationally equivalent set of behaviors that are common across countries. These studies measured leadership values and behaviors in a great variety of types of organizations—industrial, governmental, social, etc. Hence, it is indicated that there is a common set of transformational leadership behaviors that apply interculturally as well as in many different types of organizations. It is beginning to look as if leadership is leadership, no matter what type of organization you lead or where it is sited (in what country or culture).

Clearly, far more research is needed to replicate the Quesada, Gonsales, and Kent study in many more countries before we conclude that there is a single set of leadership behaviors that apply to all cultures. Additionally, we need to assess whether these behaviors are equally important to the performance of organizations across cultures.

Leadership in Organizations

Douglas Ihrke

*Department of Political Science, University of Wisconsin–Milwaukee,
Milwaukee, Wisconsin, U.S.A.*

INTRODUCTION

Leadership remains one of the least understood phenomena within the field of public administration, mainly because it has not been a focal point of public administration scholars until recently. Instead, scholars, for the most part, have approached the leadership of public organizations only indirectly under larger topics such as organization theory and behavior and public personnel administration. Thus, most theories within the field of public administration remain underdeveloped, and the potential exists for more scholarly research. Organization theory has contributed the most to what we know about leadership within the field of public administration.

One reason why the subject of leadership has not been addressed is because of the potential challenge it poses to the seminal theory within the field, which placed the public administrator in a subordinate rather than a leadership position. Early studies in public administration dealt primarily with finding a place for the public administrator under a new constitutional regime, where legislators were the primary actors in government asked to provide leadership. In fact, the guiding principle of public administration, that is the separation of policy development from policy implementation, places these actors into leader (legislator), as policy developer, and subordinate (public administrator), as policy implementor, roles. This guiding principle became known as the politics/administration dichotomy.

THE POLITICS/ADMINISTRATION DICHOTOMY AND BUREAUCRATIC LEADERSHIP

The politics/administration dichotomy was first articulated most notably by Woodrow Wilson^[1] and Frank Goodnow^[2] around the turn of the twentieth century, when like-minded progressive reformers came together with an interest in ridding government of corruption and wresting away power from political parties. Leadership in governmental organizations during the years leading up to the reforms implemented by progressives was largely based upon patronage, the quintessential form of what James McGregor Burns^[3] dubbed transactional leadership, a form of leadership based upon an exchange between leaders and followers.

The politics/administration dichotomy was the intellectual idea used by reformers to bring about change in government. The theory was non-threatening to those in power in that it left political decision making to politicians, while also elevated the public administrator to the level of formal actor in the process of governing. The theory was also protected from controversy by the cover of science. At the time, science, as an epistemology, was becoming popular in the United States and around the world due to its potential to advance human knowledge and raise the standard of living here and abroad. Science, the reformers argued, could be used as a means for discovering principles to manage organizations and thus make them more efficient and effective. Who could argue with such logic? Thus, reformers were a politically astute group of individuals interested in transforming government. Reformers were well aware of what they said and how it would be interpreted.

The politics/administration dichotomy as a theory of leadership was also popular during the early years of the field of public administration in part because of its emphasis on the use of business principles to manage government. In fact, the articulation of the theory in 1887 coincided with a period of rapid industrialization in the United States, and the predominant ethos in the United States at the time was social Darwinism. Thus, business principles emphasizing the bottom line and the quest to get ahead fit squarely with the promise of public administration to help advance the interest of Americans.

Leadership during the early years of the field was approached with caution. The prototypical leader was the technical manager, whose real value was ostensibly found in knowledge of scientifically derived business principles applied to organizations. Real leadership, that is handling tough value questions, was left up to elected officials under the politics/administration dichotomy. The technician would manage day-to-day governmental affairs in a rapidly changing society such that the politician could be left alone to deal with ethical and political questions that society brought about.

Scholarly works published in the field shortly after the articulation of the politics/administration dichotomy focused mainly on the structural characteristics of organizations. Authors such as Frederick Taylor,^[4] Chester Barnard,^[5] and Luther Gullick and Leonard

Urwick^[6] were associated with what the field now classifies as the Classical Period in public administration. Leadership, the Classicists maintained, consisted of figuring out the most efficient and effective form of organization. Thus, these scholars explored such questions as how to scientifically control the work of employees, how to use hierarchy to maintain authority and control information flow within the organization, and how many subordinates a manager could effectively supervise.

There remained, however, a thorny problem with regard to governance and leadership under the politics/administration dichotomy and the writings of the Classicists. The problem had to do with the fact that these theories, as implemented in practice, did not hold up to reality. That is, reality revealed that administrators were in fact engaging in value decisions, a violation of the pure form of the politics/administration dichotomy. This situation posed a challenge to democracy, because public administrators protected by civil service laws, implemented as part of the 1883 Act, could not be removed from office for political reasons. Thus, the public administrators were engaging in political decision making without being held accountable for those decisions via elections like their legislative counterparts.

LEADERSHIP AND DECISION MAKING

Herbert Simon, one of the most prominent scholars in the field of public administration helped to reveal this flaw in his writings, most notably in *Administrative Behavior*.^[7] Simon not only challenged the theoretical foundations of the field in terms of portraying the administrator as a fact-finding instrument of politicians, but also the basis for assuming full rationality in applying business techniques to the development of a science of administration. Through his efforts, Simon helped to change the focus of leadership studies in public administration from managing the structure of organizations to better understanding human decision making in organizations and emphasizing the needs and behaviors of the individual as they related to organizational needs.

Simon's new leader was faced with the challenge of trying to guide imperfect decision makers in a rapidly changing world. Simon argued that human beings are incapable of ever being fully rational, a desirable and assumed state under the politics/administration dichotomy, and are only capable of working within what he termed "bounded rationality." Decision makers, in Simon's view, were bounded in their decisions by their human limitations. No person could ever have all the facts, much less, the necessary time to accumulate all those facts, thus leaving the decision

maker in a position of "satisficing." To satisfice is to make the most satisfactory decision that will suffice in meeting the needs of the organization. The leader under this view was then left to put the decision maker in the best possible position in order to do the job. Among the alternative tools available to the leader to do this were hierarchy, as a means for controlling information flow and authority, and standard operating procedures (SOPs), used to provide insurance to the organization for consistency in decision making by subordinates.

Simon's work did much to challenge what had been written up to the time about leading public organizations. Simon did more than just criticize, however, as his work also spawned a new area of concern for the leader of organizations. Ideas about human relations became the new focus for many in the field of public administration due to Simon's emphasis on the role of the individual in organizations. In the late 1930s and well into the 1940s, Human Relationists called for leaders to consider individual needs and desires when attempting to manage public organizations. Organizations that neglect individuals could never fully tap the human resource that was potentially at the disposal of leaders. Human potential, the Human Relationists argued, is a resource more powerful than organizational structure and could be used effectively to maximize performance in organizations.

THE LEADER AND THE NEEDS OF THE INDIVIDUAL

A number of scholars are considered part of the Human Relations movement. Some of the more prominent include Abraham Maslow^[8] and Douglas McGregor.^[9] Maslow argued that all humans have certain basic needs (i.e., physiological, safety, social, self-esteem, and self-actualization), and these needs are arrayed in a hierarchy. Once a lower-level need is satisfied, it no longer serves as a motivator for the individual. For example, once a physiological need such as that for food and water is satisfied, the individual is no longer motivated to pursue it, and can thus move on to the next highest level of need, that is the need for safety, etc.

McGregor^[9] picked up on Maslow's need theory and developed a new leadership paradigm that challenged the basic assumptions of the management paradigm of the Classicists. McGregor argued that the way the Classicists viewed employees led to a particular leadership style. That is, by viewing employees as lazy and wanting to avoid responsibility, the leader was forced to engage in strict supervision, characterized by directing, coercing, and controlling employees through such means as hierarchy and standard

operating procedures. McGregor dubbed this type of leadership Theory X leadership, which he argued could only satisfy the lower-level needs of the individual. However, an alternative view of human nature was available to leaders, according to McGregor. That view thought of humans as being creative, motivated, and desiring responsibility. Based on this alternative view, leaders would be asked to engage in Theory Y practices. The crux of Theory Y management was the principle of integration, which asked the leader to design organizational structures and SOPs such that the needs of the individual could be fully integrated with the needs of the organization and thus achieve maximum performance. Theory Y would allow the individual to satisfy higher-order needs, those needs that released the potential of the individual.

In summary, early theories of leadership in public administration emphasized organizational structure and SOPs. Emphasis on these aspects of organizational life was the result of a particular view of human nature (Theory X). The work of Herbert Simon challenged these basic ideas and changed the focus of leadership research to that concerning the individual working within bounded rationality and that individual's needs and desires. This new focus was part of Theory Y management.

LEADERSHIP AND THE ENVIRONMENT

During the early period of public administration thought, two less dominant discussions within the field were taking place. One discussion explored the traits of individuals that make for good leaders. Early trait theories go back to the writings of the Greeks and Romans, and this discussion remained a part of public administration thought. The other more prominent discussion within the field dealt with the differences between closed and open systems of organizations. Closed organizational systems are characterized by repetitive tasks with consistent conversion of inputs to outputs and relatively minor environmental uncertainty. Open organization systems thinking views organizations as organic systems, akin to biological organisms, where environmental threats are a regular part of life, and organizations are asked to adapt to them or die.

The early literature on leadership in public administration essentially viewed public organizations as closed systems. By viewing public organizations as closed systems, scholars could limit their concerns to controlling organizational life through such means as hierarchy, rules, and rationality. This view also allowed for a clean separation of politics and administration as well as facts and values. Under closed systems thinking, administrative leaders were asked to deal

with factual issues, while political leaders dealt with values. The closed system perspective fit squarely with the politics/administration dichotomy.

The open systems view challenged the closed view that organizations are rational. Practice in public administration had revealed that administrators are not merely cogs in a machine and that they engaged in value decisions. Administrators were forced to make value decisions, because the environment they worked in was never fully closed. Instead, as Norton Long argued, administrative life was filled with politics, and the astute politician was one who understood that the "lifeblood of administration is power." The influence of the environment around public organizations was a constant threat, and the leader needed to play the game of politics in order to build and maintain the organization.

Thus, public administration remained a developing discipline with no clear articulation of what it took to successfully lead public organizations. Disagreement, more than anything else, seemed to characterize relations among scholars on the subject of leadership. The specific study of leadership had yet to be undertaken, at least not until after the debate over the closed and open aspects of organizational life had concluded.

James D. Thompson,^[10] in his seminal work, *Organizations in Action*, did much to end this debate. From roughly the 1930s through the 1960s, the closed system approach had come under attack, because it failed to meet the test of reality for most public organizations. Thompson saved the closed system view of organizations by placing it within his larger model of organizations. Thompson also put the open systems view in its place by collapsing it into the same model. He argued that both the closed and open systems views were correct, but only so far as within a certain domain in organizations.

Under Thompson's model, organizations consist of three basic levels, each with a particular set of responsibilities and challenges. The executive level sits atop the organization, in the middle, the managerial level, and at the bottom, the technical core.

Leaders are asked to do different things depending upon which level they work within in organizations. At the executive level, leaders are asked to deal with the internal and external environments of the organization, with primary emphasis on the external environment. The external environment includes the market the organization works within, its competitors, as well as such things as fluctuations in the workforce. Individuals at this level are asked to lead the organization in terms of the mission and vision the organization takes on as well as to strategically plan for the future. Leaders at this level work within an open systems environment, and the ability to deal with uncertainty

is at a premium in terms of the skills required of successful leaders.

At the lowest level of the organization is the technical core. At this level, rationality is at a premium due to the fact that it is here that the goods and services most identified with the organization are produced. Consistency in day-to-day operations is also at a premium, and employee tasks are structured so that consistency is maintained. Leaders at this level are asked to ensure that the right products are produced at the right time by virtue of getting the goods necessary to the technical core to produce those products. Environmental uncertainty is unwanted at this level, as it disrupts the operation of the technical. Thus, those in the technical core have a desire to work within a closed system.

In the middle of the organization rests the managerial level. Managers are asked to take what can be a nebulous vision and mission of the executive level and transform them into a set of achievable goals and objectives for the technical core. Managers are asked to buffer the technical core from the uncertainties of environmental fluctuations. Managers are also asked to implement changes desired from above in such a way as to minimize disruption in the day-to-day affairs of the technical core.

Thompson's work thus reestablished closed system theories to a level of respectability, while at the same time, provided a model of reality with regard to how organizations operate. Yet, Thompson's work does not provide much insight into what separates good leaders from bad leaders. Scholars in other fields such as business and psychology had developed theories of leadership, but they were largely left unnoticed until the 1970s.

CONTEMPORARY THEORIES OF LEADERSHIP

James McGregor Burns published one of the most popular books dealing with leadership in 1978. In his book, *Leadership*, Burns, among other things, distinguished between transactional and transformational leadership. Transactional leadership was based upon an exchange between the leader and the follower, where the leader would offer certain resources (e.g., authority, wages, etc.) in return for effort on the part of employees. Transformational leadership was something different in the mind of Burns. Transformational leaders went beyond transactions to fundamentally change organizations, such that they no longer resembled what they once were. Later, Bernard Bass^[11] would place these two types of leadership on a continuum with transactional leadership on one end, and transformational leadership on the other.

Works by Burns and Bass did not specifically address leadership in public organizations. Instead, these authors dealt primarily with what it would take for organizations to meet the challenges on the horizon, and those challenges were many.

The 1980s and 1990s brought a great deal of attention to leadership. Challenges from foreign competitors to American industry, such as auto manufacturers, pointed to the need for better leadership. Books such as *In Search of Excellence*, by Peters and Waterman, among others, provided some hope for the future of American organizations. An emphasis on quality was popularized by W. Edwards Deming^[12] during this period, as was an effort to rid organizations of inefficient processes, popularized by Hammer and Champy.^[13] Leaders would be asked to rid their organizations of outdated ways of producing products and services and implement new means for meeting customer needs.

Public organizations were facing challenges during this period as well. Developments such as tax revolts by citizens in the 1970s, along with efforts to privatize governmental services in the 1980s and 1990s, forced scholars to examine leadership in public organizations. Public organizations were faced with the dilemma of reducing taxes, increasing the quality and quantity of services, while at the same time, competing with private vendors.

The reinventing government initiative was one result of these changes. Osborne and Gaebler^[14] suggested that, among other things, that governmental organizations and their leaders need to "steer rather than row." At the federal level, reinventing government reached its zenith with President Bill Clinton's National Performance Review (NPR), a nationwide effort to reduce government of waste and inefficiencies. At the local level, leaders were asked to consider ways to reduce waste and inefficiency as well, through such means as privatization and implementing quality and process reengineering initiatives.

To date, relatively few public administration scholars have explored leadership in public organizations, with a few notable exceptions. These exceptions include, for example, works by Larry Terry^[15] and Robert Denhardt.^[16]

Terry develops a model of leadership known as the administrator as conservator. The role of the leader under this model is to protect the institutional integrity of the organization. The leader does this through conserving the mission, values, and support of the organization. The administrative conservator is guided by constitutional principles and is therefore not a threat to democracy. Terry equates conservatorship to that of statesmanship, which requires professional expertise, political skill, and a sophisticated understanding of what it means to be an active participant in governance.

Table 1 A sample of theories of leadership

Leadership theory	Authors	Elements
Behavioral	Yukl, 1994	The job of the leader is to build and maintain effective relationships with people whose cooperation and assistance is needed to accomplish task objectives. Examples of leadership behaviors include supporting, developing, recognizing, rewarding, team building and conflict management, and networking.
Charismatic	Bass, 1985; Conger and Kanungo, 1987; Trice and Beyer, 1993	Charisma is the result of follower perceptions and attributions influenced by actual leader qualities and behavior, by the context of the leadership situation, and by the individual and collective needs of followers.
Contingency (two examples)		These are theories that explain leadership effectiveness in terms of situational moderator variables.
1. Path-goal	1. Evans, 1970; House, 1971	1. Leader's motivational function consists of increasing personal payoffs to subordinates for work-goal attainment and making the path to these payoffs easier to travel by clarifying it, reducing roadblocks and pitfalls, and increasing the 'opportunities for personal satisfaction en route.
2. Least preferred coworker	2. Fiedler, 1964, 1967	2. Describes how the situation moderates the relationship between leader traits and effectiveness. Favorableness of the situation is influenced by leader-member relations, position power, and task structure.
Cultural	Trice and Beyer, 1991	This provides an emphasis on cultural innovation, where the leader either makes drastic changes in the existing culture or starts a new organization with a different culture.
Participative	Yukl, 1994	This involves power and behavior approaches to leadership. It includes aspects of power such as power sharing, empowerment, and reciprocal influence processes, and it includes aspects of leadership behavior such as the specific procedures used to consult with people to get their ideas and suggestions, and the specific behaviors used to delegate authority.
Power	Podsakoff and Schriesheim, 1985	Theory suggests there are different types of power (i.e., expert, referent, legitimate, reward, and coercive) at the disposal of leaders. Leaders use these types of power to guide their organizations.
Traits and skills	Stogdill, 1948	Certain traits and skills differentiate between leaders and non-leaders.
Transactional (one example)	Bass, 1985	Leaders exchange rewards for compliance on the part of followers.
1. Leader-member exchange	1. Dansereau, Graen and Haga, 1975	1. Leaders develop different exchange relationships over time with various subordinates. Basic premise of the theory is that leaders usually establish a special relationship with a small number of trusted subordinates (the "in group"). The exchange relationship established with the remaining subordinates (the "out group") is substantially different.
Transformational	Burns, 1978; Bass, 1985	The extent to which a leader is transformational is measured primarily in terms of the leader's effect on followers. Followers of a transformational leader feel trust, admiration, loyalty, and respect toward the leader, and they are motivated to do more than they are originally expected to do. The leader transforms and motivates followers by: 1) making them more aware of the importance of task outcomes; 2) inducing them to transcend their own self-interest for the sake of the organization or team; and 3) activating their higher-order needs.

Robert Denhardt,^[16] in his book, *The Pursuit of Significance*, explores stories of success in governmental leadership. Denhardt examines the ways in which leaders of public organizations have met the needs of customers, implemented quality, and reduced waste and inefficiency. Denhardt's leaders do this through a commitment to values, serving the public, empowering employees through shared leadership, using pragmatic incrementalism, and being dedicated to public service. Denhardt argued that these practices lead to the pursuit of significance on the part of leaders. These leaders have substituted the pursuit of significance for the pursuit of private interest.

CONCLUSION

Scholars in other fields have produced theories of leadership, but these theories have been nearly ignored by scholars in public administration. These theories and their basis, and the authors most identified with them, are listed in Table 1.

As the field of public administration evolves, more theories will be developed on what it takes to lead governmental organizations. The face of leadership in public organizations continues to change with the times, while at the same time, it is constrained by constitutional principles that place checks on what can and cannot be done.

INTRODUCTION

Within the wide range of differing views of what constitutes leadership, one view that has gained increasing momentum is the notion that integrity is at the heart of what makes leaders effective because it is the foundation upon which high-trust relationships are built. Therefore, it is the basis for effective interpersonal, managerial, and organizational interaction. In short, people more willingly follow those whom they trust.

REQUISITE CONDITIONS FOR INTEGRITY TO EXIST

Three conditions are required for integrity to exist: 1) the existence of moral law, or “fixed moral principles,” subordination to which produces consistent consequences; 2) knowledge of right and wrong, which is generally conferred by conscience; and 3) individuals must possess agency and choice, thus enabling them to become, by choice, agents of moral law or fixed principles.

Moral Law

We readily recognize the existence and impact of the laws of nature in the physical world. The laws of gravity, heat conduction, centrifugal force, thermodynamics, and mathematics, for instance, govern the machinery of everyday life. To influence others by the exertions of integrity assumes that moral laws operate in their sphere just as actively as do the laws of physics or biology in the physical world. Although often more difficult to define and describe, they are just as real. Thus, we say, for instance, in illustrating moral laws, that “we do not trust dishonest people,” that “when we violate conscience, we feel inner conflict,” or that “we reap as we sow.”

When people act in harmony with moral law, they produce predictable responses and consequences. This, in turn, means that when leaders act in harmony

with moral law, followers recognize such behavior as honorable and are therefore willing to follow it. In other words, by subordination to moral law, leaders learn and exhibit integrity, which inspires followership in others. People may choose to obey or disobey the law, but they cannot choose the consequences that will inevitably follow. The principles upon which the law operates are fixed, or unchanging; they transcend time, place, and cultural context. They are objective and operate external to the perception, bias, opinion, or viewpoint of those upon whom they have an impact. This does not mean that perception, bias, opinion, or viewpoint does not affect how we react to the laws, only that the laws represent “fixed principles.”

Knowledge of Right and Wrong

For people to demonstrate integrity, they must choose right over wrong. This necessitates that they know right from wrong and this implies the existence of opposites. All things, of course, are known by their opposite—we know hot because we know cold, sweet because we know sour, light because we know darkness, and good because we know evil. Similarly, we know integrity because we know self-betrayal, its opposite. The knowledge of right and wrong is lodged in individual conscience, or what Socrates called the “inner voice,” which is a unique human endowment. When people respond to and live in harmony with the promptings of conscience, they demonstrate integrity. However, when they violate or disregard the promptings of conscience, they self-betray. To lead with integrity, leaders must be aware of both right and wrong and must choose right.

Agency and Choice

Moral agency implies subordination to moral law, and choice is the process of selecting between opposites or alternatives. When fixed principles are in operation and one chooses to subordinate their behavior to them,

one can expect fixed consequences to follow. By subordinating self to moral law, one becomes an agent of that law, much the same as a representative is an agent of the person giving the original commission. For instance, when leaders tell the truth, they can expect to be treated and perceived as truth tellers or honest leaders. In the ancient world, Cato the Younger did this so well that his name became a synonym for integrity. Thus, the ancient Roman dictum in trials sought for multiple witnesses, and “not even a Cato” should be a lone witness, particularly where a story was so strange that it would be hard to believe “even though a Cato told it.”^[1]

Leading with integrity is often easier to illustrate than to define. In organizational contexts, it is often described in organizational folklore, organizational stories, anecdotes, parables, myths, and even jokes and homily. When Plutarch wrote *The Lives*, for instance, his motive was to illustrate virtue so that others might imitate it. “Admirable actions,” he wrote, “can produce, even in the minds of those who only read them, an eagerness which may lead them to imitate them The bare account of noble deeds can make us admire and long to follow the doers of them. Moral good is a practical stimulus; it is no sooner seen than it inspires an impulse to follow it.”^[1] By providing moral exemplars, Plutarch commended to his readers those same behaviors that had made his moral exemplars influential. However, he also showcased the negative effects that unfolded in the lives of those who lacked the virtues of which he wrote, thus teaching that in the absence of virtue, vice reigned.

INTEGRITY AND LEADERSHIP STYLE

Some leadership styles lend themselves more readily to the exercise of integrity than others. A participative style is more amenable to high integrity than a coercive one. Hitler, for example, wrote that coercion and brutal force were legitimate means of changing social behavior.^[2] He often concluded that he alone could make many of the decisions in his Reich. Because of his repressive and brutal actions toward those with whom he disagreed, many in his chain of command, fearful of offending him, refused to make many of the ordinary or mundane decisions associated with their command. Rather than thinking for themselves, they often sought to ingratiate themselves to Hitler, rather than doing what they believed was right. In short, they were untrue to themselves.^[3] In contrast, the more democratic style of interaction held by Lincoln allowed him to define objectives with his commanding generals and leave to them the task of finding ways to fulfill those objectives. General Ulysses S. Grant, for instance, said to his staff, “the President

is one of the few who has not attempted to extract from me a knowledge of my movements, although he is the only one who has right to know them.”^[4] On another occasion, Lincoln sat late at night signing military commissions and said to an aid, “I do not, as you see, pretend to read over these documents. I see that [Secretary of War, Edwin] Stanton has signed them, so I conclude they are all right.”^[4]

Although many descriptors might be used to describe different leadership styles, all styles tend to fit along a continuum that stretches from the high external control or authoritarian styles at one end to the low external and high internal control, democratic, or participative styles at the other end. The theory of high-integrity leadership assumes that high-integrity styles will gravitate toward the high internal or self-control end of this continuum and that there are many behavioral correlates to high integrity that are typically identified as virtues. These virtues usually include such traits as treating people fairly, being just, kind, civil, truthful, respectful or loving, consistent and reliable, expert, and dynamic. These traits inspire the trust of others and, therefore, correlate with the components of a highly trustworthy individual, meaning that high-integrity leadership is synonymous with leadership trustworthiness.^[5] High-integrity leadership further assumes that the leader’s focus is first on building his or her own character and then working through that character to exert an influence on others. This means that such intangible variables as credibility, reputation, perceived trustworthiness, and honor are central to the leadership equation. High-integrity leaders not only know it, but also use virtue to influence others for good. They can, therefore, be influential by appealing to the moral sentiment and conscience in others.

Lincoln, illustratively, was so well regarded for his integrity that he was given the sobriquet of “Honest Abe.” Aware of the power of being regarded as honest, Lincoln used his reputation to accomplish what he believed were noble ends. For example, deep in the Civil War, Lincoln’s wife stood accused of treasonously leaking information to the enemy. The Senate Committee on the Conduct of the War met to consider the charges. A secret meeting of the committee was set. “We had just been called to order by the Chairman,” said one committee member, “when the officer stationed at the committee room door came in with a half-frightened expression on his face.” The reason for the officer’s discomfort became immediately apparent, when, unannounced, committee members saw Lincoln, standing at the front of their committee room table. No one seemed to know what to say, and an awkward silence cloaked the room. Then Mr. Lincoln spoke: “I, Abraham Lincoln, President of the United States, appear of my own volition before this Committee of the Senate to say that I, of my own knowledge,

know that it is untrue that any of my family hold treasonable communication with the enemy.” Having so spoken, he left as silently as he had come. “We sat for some moments speechless. Then by tacit agreement, no word being spoken, the committee dropped all consideration of the rumors that the wife of the President was betraying the Union. We were all so greatly affected that the Committee adjourned for the day.”^[4]

Lincoln’s reputation as a man of integrity had saved himself, his family, and perhaps the nation from a significant anguish. In so doing, he demonstrated not only the power of a good reputation, but also one important dimension of high-integrity leadership—that living to have a claim on the conscience of others gives one power. This “reputational power,” or the power of a good reputation, is something resident within the character of an individual and is the outgrowth of having lived worthy of the confidence of others. It is, therefore, perceptual, meaning that high-integrity leaders must cultivate character predispositions and traits that enable them to be the same in public as in private. In this, the notion of high-integrity leadership differs from theories that say that leaders should reflect the values of followers (which arguably is a form of followership and not leadership), or from situational and contingency theories that argue that leaders are either the products of differing situations or simply take advantage of circumstances, or even from transactional theories that say leadership is “a bargain,” “a deal,” or a “transaction” that leaders make with followers. As Ghandi said, “man cannot do right in one department of life whilst he is occupied in doing wrong in any other department. Life is one indivisible whole.”^[6]

HIGH-INTEGRITY LEADERSHIP AT FOUR LEVELS

All organizations exist at four levels, and high-integrity leadership is manifest at each level. These levels include the personal level, the interpersonal level, the managerial level, and the organizational level. At each level, a governing principle dictates the exercise of integrity in all human interaction.

Personal Level

At the personal level, integrity is a matter of the individual acting in concert with conscience, and the governing principle is trustworthiness. Simply stated, one must be worthy of the trust of others before he or she will be trusted. Thus, influence exertions begin by leaders modeling behaviors that generate trust; they are first at one with self, and others see that oneness or consistency in the leaders’ behavior. Trustworthiness

grows out of two concepts: character and competence. Trustworthy leaders, thus, model trustworthiness (character) and have both the interpersonal and the technical skills (competence) necessary to lead in the particular realm in which they operate.

Interpersonal Level

Trust results in the perception on the part of an individual that a leader is worthy of confidence. It is the fundamental glue and lubricant of relationships; it holds relationships together and facilitates interaction within them. Trust is the governing principle at the interpersonal level: Where trust exists, people work more harmoniously and more productively, and production-related variables such as communication, decision making, coordination, cooperation, etc., are positively affected. Where trust is absent, suspicion, cynicism, doubt, and related negative emotions and perceptions result.^[7]

Managerial Level

By definition, leaders and managers accomplish things through other people. Thus, the governing principle at the managerial level is empowerment—the process of giving employees responsibility and resources, defining to them goals and objectives, giving them the freedom to define how they accomplish those goals, and then holding them accountable for results. One of the most powerful means for accomplishing such empowerment, or of facilitating trust at the managerial level, is the personal management interview (PMI)^[8] or what Covey has called “the win-win agreement.”^[9] The PMI or win-win agreement meeting is a meeting between two parties, generally a superior and a subordinate, in which past accomplishments are reviewed; goals, objectives, and/or desired results specified; resources agreed upon and strategies delineated; accountabilities specified; and consequences for accomplishment or failure determined. When such meetings occur on a regular basis, both trust and production levels are high; in their absence, both trust and production levels fall.^[8] Because PMIs or win-win agreement meetings hold both parties to the agreement accountable to one another and to the agreement itself, it gives leaders an opportunity to build and nurture trust at managerial levels.

Organizational Level

Trust exists at the organizational level, when an alignment exists between the strategy, structure, and systems of the organization and the vision, mission, values, and goals of the organization. The greater the congruity between these two grouping of variables,

the greater the level of trust or the more impactful the high-integrity leadership; the greater the gap between these two sets of variables, the lower the trust, and the less impactful will be the perceived integrity manifest by the leadership.

Strategy consists in the work processes people follow to get the job done; it is the “how to” or road map, followed by which accomplishments occur. Structure deals with reporting relationships—“who reports to whom.” Systems are those support networks that facilitate work flow by organizing labor, resources, and materials. When the ideas and values around which we organize—the mission, vision, values, and goals of the organization—are part of strategies we pursue, then alignment exists. By thus integrating the individual and the organization and its subparts, organizations demonstrate a high degree of alignment, which is the organizational manifestation of high integrity. Because organizational levels of interaction require more effort and coordination than activity at personal levels, and because it is often more difficult for people to think strategically, alignment is much more difficult to achieve than are the manifestations of trust at personal, interpersonal, and managerial levels. Leadership at this level, however, is the great essential to organizational effectiveness (for a detailed description of integrity leadership, which Covey calls “Principle Centered Leadership,” and from which much of the material in this article is distilled, see Ref.^[9]. For additional insight, see Ref.^[10].)

STRENGTHS AND WEAKNESSES OF HIGH-INTEGRITY LEADERSHIP AS AN APPROACH TO LEADERSHIP

As an approach to the study and understanding of leadership behavior, the focus on high-integrity has both strengths and weaknesses. Prominently, its weaknesses include the fact that it is based very deeply in the perceptions of those involved. Because perceptions among people differ so dramatically, particularly on issues relating to values and character, confusions can occur as to the meanings of perceived behaviors. At the same time, a given behavior can be subject

to multiple perceived interpretations, resulting in additional confusion. What one person might consider to be great and noble, another might view as weakness. Alexander the Great and George S. Patton, to illustrate, were seen by many as attack commanders who were decisive and determined; others saw in those same behaviors impetuosity and impulsiveness.

The perceptual nature of discerning high-integrity leadership, however, is also one of its strengths. People intuitively resonate with the idea that high-integrity people are to be trusted, followed, and encouraged by their followership. Yet, when the values of the followers align with those of the leader, it is likely that the leader will be perceived as possessing high integrity, which adds to his or her power base and thus the ability to get things done.

Learning Organizations

Montgomery Van Wart

Department of Public Administration, California State University-San Bernardino,
San Bernardino, California, U.S.A.

INTRODUCTION

Learning organizations are characterized by a high number of both members and groups who adapt to job challenges by rapid learning, and by a culture that nurtures experimentation, innovation, and thoughtful change. Typically, learning affecting organizational practices is diffused throughout the organization (not just among executives and experts), and fundamental dialogs about best or innovative practices include both middle managers and line workers. Also, in contrast to traditional organizational structures that emphasize hierarchy and control, organizational structures tend to be flatter, more flexible, and more fast changing.

The concept was first broadly popularized by Senge in his extensively read book, *The Fifth Discipline*,^[1] which fully articulated the conditions and elements of such organizations. However, the idea and the term were in use much earlier. Argyris, in particular, had been working in this area for many decades, first regarding the full incorporation of lower-level individuals into corporate life^[2,3] and later regarding types of learning in organizations.^[4-7] More recent work focused on breaking down the defensive routines of individuals that impede individual and group learning. Others who were particularly important in the development of the concept were those in the human relations movement—Schön, who worked extensively with Argyris, and Schein, whose work focused on healthy organizational cultures and the role of leadership in achieving them.^[8] Learning organizations are an example of what French and Bell call “second-generation organization development (OD).” The first generation of OD spanned from the late 1940s to the mid-1980s, focusing on behavioral and management science interventions for organizational improvement by theorists such as Lewin, Argyris, McGregor, Blake and Mouton, Beckhard, Likert, Bennis, and Golembiewski. The range of organizational improvement strategies in OD certainly included organization-wide approaches. Although often largely unacknowledged in the rash of new management approaches that occurred in the 1990s, the contribution of first-generation ODs was substantial—see for example, Watkins and Golembiewski.^[9] The second generation—largely occurring in the 1990s—included total quality management (and a related version in the

public sector, reinvention), re-engineering, team-based organizations, learning organizations, and other reform strategies.

Senge’s overall definition of the learning organization is “where people continually expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning how to learn together.”^[1] Garvin, however, has a much more popular overall definition: “an organization skilled in creating, acquiring, and transferring knowledge, and at modifying its behavior to reflect new knowledge and insights.”^[10]

THE LEARNING ORGANIZATION ENVIRONMENT

Although all the major writers of the learning organization speculate about the reasons for its ascendance as an idea (even if the reality has been quite rare), it is useful to look to a prominent public sector theorist for the specifics within that particular environment. In the first major essay in the public administration field that discusses learning organizations in light of the attention that Senge brought to the concept, Kettl provided four major reasons in support of the learning organization in the public sector.^[11] First, he speculated about the end of bureaucracy as we know it (which he more aptly called the “twilight of bureaucracy”) because of the need for faster and more responsive organizations with less expensive overhead (flatter). Second, he pointed out the increased government reliance of external expertise, causing organizations to become more like networks, and also causing a whole new set of learning dilemmas surrounding contracting and partnerships. Third, he highlighted the decline in the confidence of centralized science solutions, which means that there is a loss of confidence in expert staff teams managing all organizational change. Finally, the knowledge about problems has become highly decentralized because of the speed of change and the degree of customization more commonly required. Therefore, problem solving also needs to stay more localized when possible. In summary, learning

organizations should (theoretically) thrive in environments that are dynamic and in which knowledge is highly dispersed but necessary for successful adaptation. This can be compared with the environments in which traditional bureaucracies exist—regardless of whether they are hierarchical bureaucracies more typical of the public sector or rational bureaucracies found in the private sector—in which the ideal conditions are stable and knowledge is highly centralized.

Despite the widespread agreement about the enabling conditions for learning organizations, they have not flourished as they might because of the exceptional challenges confronting them.^[12] First, by definition, the structure is less clear. Typically learning organizations are flatter, have looser formal links, and look more like networks. The links are looser in terms of rules and regulations, but nonetheless tight informal links are required in terms of cooperative synergies. Because of the need for constant reorganization to adapt to new problems, they tend to be self-organizing and “messy.”^[13] Individuals have larger, but far less defined, roles. Although these features give rise to learning organizations when they are properly functioning, when improperly implemented they lead to confusion, lower productivity, in-fighting, and lack of organizational focus, among other dysfunctions. Second, this type of amorphous structure and environment gives rise to a high degree of stress for many individuals who prefer more “organized” environments, stable conditions and standards, sharper role clarity, and high job security. Those who like more structured environments expect higher incentives (e.g., pay, working conditions, and prerequisites such as training) for staying in the organization. Further, because of the loose management structures, the more creative types of people bred by the organization are easily alienated and more likely to move to other organizations if conditions are less than ideal. Third, learning organizations require highly trained individuals. This requires background education on the discipline, organizational knowledge about systems, processes, culture, etc., and training in the specific skills necessary for the job. It also requires advanced skills to make greater use of learning by sharing, comparing, systems thinking, competing, and suspending disbelief.^[14] That is, advanced learners not only learn about basic knowledge and skills, but also become adept at learning how to learn in order to solve entirely new problems that confront the organization. However, the cost of hiring and training employees rises dramatically as better-educated individuals demand better salaries and the cost of constant training, including self-training, increases exponentially. Thus, recruiting and retention problems for learning organizations are particularly challenging.

MACROLEVEL STRATEGIES IN ACHIEVING LEARNING ORGANIZATIONS

Senge's macrolevel strategies—essentially his operational definition—is the most well known. It includes systems thinking (the fifth and integrating discipline), personal mastery, mental models, shared vision, and team learning. These are discussed more fully in the section on microstrategies.

Another well-known set of strategies is that of Garvin who also has five elements to his schema, but focuses on a more developmental or sequential approach. The first element is a systematic problem-solving approach. Learning organizations understand that problems are part of conducting business and build them into business operations with the time, resources, and support to work on them. Further, problems are systematically sorted into minor and unusual ones, or significant and chronic ones for different types of analysis and attention. Second, learning organizations experiment with different possible solutions to see what works best. Such organizations may have pilot runs, multiple formats, or time-series experiments to find the best practice for their organization. Third, learning organizations systematically review their own experience. Although this may be the result of a pilot or test, more often it is simply the result of past performance. It may range from spending a few minutes at the end of each meeting to critique the meeting itself, to the rigorous analysis of budgetary data for long-term trends, to the systematic use of performance data by frontline workers to see what mistakes were made or what practices produce the best results. Without good performance measurement systems, an organization generally cannot achieve success in this element. The fourth element is learning from others. Although this includes learning from others in the organization, it often emphasizes such practices as benchmarking, which is studying other high-performing organizations to see what they do well and learn from the comparative experience. Finally, learning organizations systematically disseminate the information learned from solving problems, experimenting, reviewing experience, and learning from others. By disseminating information about the successes of one part of an organization with others, they can recognize and celebrate those achievements as well.

MICROLEVEL STRATEGIES IN ACHIEVING LEARNING ORGANIZATIONS

Inevitably, there are a host of methods, tools, and concrete strategies to implement the macrolevel strategies. In 1994, Senge with others produced a fieldbook to further explicate ways to put into practice each of the

strategies.^[15] For example, he identifies numerous useful tools that assist in this area, such as process mapping, culture analysis, and identifying dysfunctional archetypes (e.g., “tragedy of the commons,” where everyone uses common resources but no one is compelled to replace them). He also suggests a step model for breaking through organizational gridlock: 1) identify the original problem symptom; 2) map all “quick fixes”—superficial solutions that either ignore underlying causes or simply replace old problems with new ones; 3) analyze quick fixes; that is, identify undesirable affects (including affects on others) and the addictive side effects; 4) identify fundamental solutions based on a deeper understanding of the problem and systems connections; 5) find interconnections in the targeted solutions to fundamental process loops; and 6) identify the concrete high-leverage actions to take.

At one level, personal mastery is simply proficiency and skill at what one does. As Senge uses the term, however, it also includes a personal vision of overall professional competence and achievement. Such a vision must have a highly realistic assessment of current strengths and weaknesses, as well as a notion of what can be improved or accomplished. It is acceptable to have “creative tension” between the vision embedded in personal mastery and the shared vision of an organization because the synergies of the two will enhance each other as strategic opportunities occur to achieve both, even though they are not identical. Personal mastery begins by articulating one’s goals (both professional and personal), values, and strengths/weaknesses. It is enhanced by actively seeking feedback about one’s mastery through others and through performance, as well as an active self-review and updating of one’s vision.

Because of the welter of experience that bombards each of us hourly and daily, we typically use mental models to frame this experience and to make sense of it. At a mechanical level, it assists us to filter the important information for tasks, such as driving a car, from the more judgmental need to value the dependability, intelligence, skills, cooperativeness, etc., of others based on the data we have. Mental models are often useful because we need to selectively screen sensory experiences through the use of shorthand assumptions if we are to function effectively and act efficiently. The problems with mental models are just as important, however, because they often lead to systematic biases about the information that is screened (leading to false assumptions) and because old assumptions are often not reviewed for accuracy. Those in learning organizations learn to test and improve mental models that often inhibit creativity, enhance insulation, and encourage negatively objectifying others.

Shared vision embodies the destiny of the organization, the sense of purpose or mission, the vision of

where the organization will be in the future, the values that people believe are necessary for work, and the goals or milestones used to achieve the vision. Senge asserts that the most important aspect of shared vision is that it stems from an ongoing discussion of what the organization is about, so that it can be as equally well described by line workers as senior managers. Having broad opportunity to be involved in direction setting has two implications for chief executive officers (CEOs): first, they must be willing to have an active level of involvement by others, and second, those included must be knowledgeable about the overall organization and committed to system-wide objectives. Senge points out that the levels of inclusion can range from telling (the lowest level), selling, testing, consulting, and cocreating (the ideal level).

Senge’s final discipline is team learning, because so much work cannot be done alone and individuals alone cannot solve the complex, interdependent problems that face them. Senge goes to some pains to discriminate between dialog and discussion. Discussion is when ideas are bounced off others in a “percussive” way; debate is an extreme form of discussion. It is good for quick information exchange and surfacing technical issues. However, dialog, which involves deep listening, suspension of past assumptions, and reflective thinking, is needed for the robust analysis of significant problems and to learn how to find new solutions. A specific technique to “unclog” teams is to have carefully facilitated sessions to discuss “undiscussables,” which gets negative mental models in the open so that they can be ameliorated by feedback and changed behavior. Senge also encourages the organizational skill of harnessing people’s uniqueness, and making diversity a virtue and strength.

CONCLUSION

The concept of the learning organization, regardless of the exact definition, brings together many of the ideal practices for our age of abundant information, rapid change, and greater organizational democracy. The practices of these high-performing organizations include greater levels of problem solving, experimentation, rigorous analysis, comparative learning, and systematic information dissemination. We can tell when such organizations exist because frontline workers will be as aware and excited about the shared vision as the CEO; individual competency and problem solving will be uniformly high across the organization; most important problems will be handled and solved by teams for fundamental solutions; and there is noticeable lack of stereotyping, cliques, and intergroup hostility.^[16]

Yet, we also know that such organizations are rare, despite our rather clear vision of what they should be like. Employees have to be well trained, well rewarded, committed, and empowered. Managers must be able to create communities of dialog to facilitate team learning and shared vision, facilitate the analysis and overcoming of negative mental models, and encourage personal learning—difficult talents to achieve indeed. Everyone must strive to embrace a practice of systems thinking rather than conventional, and more self-centered, specialist perspectives. In other words, the challenges are steep in trying to create the culture necessary for a learning organization, but it is certainly a worthy goal.

Lebanon: Corruption

Dimitri R. Hanna

*Department of International Affairs and Diplomacy, Notre Dame University,
Zouk Mosbeh, Lebanon*

Ramzi N. Nasser

Notre Dame University, Zouk Mosbeh, Lebanon

INTRODUCTION

Corruption benefits the individual or group at the expense of others or society at large. Corruption within public administration has a detrimental effect on the development of a viable democracy and a national economy and is a detriment to political stability, social cohesion, and economic growth. This paper conceptualizes constructs for corruption in the Lebanese situation. It analyzes the contexts for which types and ways corruption transpires and functions in public administration.

CORRUPTION AND PUBLIC ADMINISTRATION

Corruption in general can be defined as the misuse of public authority to gain private profit or to promote private interests. Classic and modern theories of public administration reduce corruptive acts by constructing internal control mechanisms and human resource incentives that deal primarily with, education, institutional design, and equal opportunity.

The application of Weberian concept applied to the field is prevalent in the public administration sector in the Middle East. It stresses external and internal structural control mechanisms, such as hierarchies, the role of the supervisor, a well-defined set of rules, standardized procedures, and strict implementations of programs. On the other hand, modern public management theories governed by human resource theory, stress on the individual sense of need, motivation, ability to make decisions, and social inculcations.^[1] Modern theories of public administration have not yet entered into the scheme of governance within public institutions in Lebanon or the Arab Middle East.

Since Woodrow Wilson's debate over the dichotomy between politics and administration, the field of public administration has become more attentive to administrative, managerial, and legal techniques that limit the exposure of individuals, institutions,

and societies to corruption. Despite the differences over value priorities between efficiency and effectiveness, the Weberian model subsumes important theoretical underpinnings on ethical conduct. Adopting the Utilitarian school of ethics, the Weberian model, stresses not only the development of internal structural control mechanisms in an organization, such as direct supervision, narrow span of control, and long hierarchies, but also external structural ones, such as a system of checks and balances consisting of anticorruption rules, procedures, judicial or legislative oversight, and organizational arrangements.^[2]

There are several causes of corruption in public administration in the Middle East and particularly in Lebanon. Cultural and social behaviors contradict many Weberian principles and the rule of law and becomes more flagrant in program implementation. With a largely incapacitated workforce in the public sector and strong interference from the political cadre, the effectiveness–efficiency dichotomy between political and public administrative functions have been blurred, leading to mismanagement, malpractice, inadequate control and corruption.

Weberian administrative systems with its various configurations and administrative political conditions dominate most Middle Eastern public sectors. When public administration organizations lack the necessary resources to run public programs along the Weberian values of specialization, efficiency, and political neutrality, the Weberian organization in its structural and social context creates an environment in which acts of corruption proliferate.^[3] Authority in tall structures become centralized and unchecked irrespective of organizational needs. In the absence of strong institutional leadership with clear objectives and standards, political and administrative conflation and prioritized relations open the means to all types of illegal activities at the individual and group levels such as drug businesses, unchecked border smuggling, “outlaw” enterprises, and money laundering by individuals and organized groups in cooperation with government officials and politicians.^[4]

Corruption within public administration can be conceptualized along two theoretical dimensions: structural (institutional) and cultural. The structural type within the Weberian model suggests that in administrative organizations, services meet the standard rules, regulations, and procedures. However, within ill-developed governmental administrative units, the context is set for bureaucrats to manipulate regulations, laws, and procedures, to gain in favors, monies, and political power. For example, officials as individuals might create delays, reject an application, ignore due process, or introduce costly fees that lead to some sort of kickback. The Weberian concept of administrative control is often “massaged” to serve particular individuals, networks, or even political groups.

The cultural and confessional mosaic of Lebanese society arranges the distribution of power in government asymmetrically among different groups and players. It is not unusual when a group uses state power to impose policies on another through public officials. Even the selective use of discretionary power in implementing programs might serve the confessional group, a narrow political agenda, or a multifarious confessional community; while, a great majority of citizens are left with no administrative recourse to correct governmental abuses. The political realism in Lebanon draws on political or confessional adversaries readily coalescing around corrupt arrangements where “supra-individualistic” behavior dominates over legality, political loyalty, and social affiliations.

STRUCTURAL DIMENSION TO CORRUPTION: THE POLITICAL STIGMA

Lebanon’s modern political system is organized around the division of power between the legislative and the executive branches represented respectively by parliament and the cabinet at large. The emerging political forces shaped along sectarian balances and formulations determine the balance of power between the different government branches. Competition for political position takes place within and across sectarian lines where prospective politicians compete first within their confessional group to occupy their allocated government seats and then between each other. The constitution draws the map of political interaction and the lines of legality among the different confessional actors in the political system. Despite what is written in the constitution, and in subsequent agreements, the power among different government branches varies with leadership. Thus, a strong leader of a new political group or coalition forming a majority in government tends to abuse power at the price of their adversaries. Such practice remains politically legitimate within government so long as it has

the consent of the majority and it is played within the democratic political system through the legislative, executive, and legal branches.

Nation states in the Middle East are either constitutional democratic republics—by statute, or constitutional monarchies or regimes. With the exception of Lebanon, Israel, and Turkey; invariably, all Middle Eastern countries have a strong and dominant executive authority, headed by a president or monarchy. Lebanon is politically structured around sectarian franchises where power is spread between the executive and the legislative branches. In the absence of political consensus and the rule of law, the promotion of equality, equity, and democratic practice in government is substantially hampered. With a public sector accommodating multiple sectarian groups, based on political alliance, Weberian neutrality and efficiency are downgraded substantially and sacrificed for the interest of a minority or group. The problem is further heightened when quota of confessional representation, in government hiring is protected and prioritized over Weberian administrative principles of merit, neutrality, or procedural regularity.

In the more adverse cases in the Middle East, such as in oil-producing countries, the Weberian administrative system is brought to a complete halt where autocratic, monarchistic, tribal, and ideological values and norms supersede national and international legal stature. Emptied from its organizational logic, the use of the Weberian model is still attractive and widely popular in the Middle East for its simple structure and concentration on authority. The attractiveness of the Weberian system by Middle Eastern regimes is found in its political form than in its productive outcome.

Leaders of political parties and multiconfessional groups provide variegated perspectives on governance and interest in public programs, leading to a divergent consensus about how public institutions should be run. The greater the cultural heterogeneity and political divergence, the harder it is for the state and public sector to accommodate the Weberian bureaucratic principles of positive neutrality, common values, merit, efficiency, and ethical standards.^[5] Overall, the Weberian model applied to a political environment is filled with contradictions, complexities, and confusions, rendering it susceptible to individual or group acts of corruption.

SOCIOCULTURAL DIMENSION TO CORRUPTION

Society at large has an inexorably strong role in shaping citizens’ sense of fairness and legitimacy, and in determining their level of tolerance and permissive attitudes toward corruption. Society in the Middle East plays an important role in the proliferation of

corruption.^[3] The patriarchal conditions in strong kinship society often replace the rule of law by an economy of affection centered on the “Patra.” These conditions distort the workings of public sector institutions in the traditional Weberian concept.

Public administration practice under confessionalism is one of the primary causes for contradictory administrative practices. For example, in Lebanon, public sector appointments are divided across confessional lines and are meant to maintain a delicate confessional balance. The efficiency value is compromised at all levels of the workplace: in hiring, development, and firing. Organizational needs and workforce specialization are always subject to compromise not in the best of government interests. For instance, the positioning of nonspecialized jobs of the first and second ranks in government are based on the strength of the connections between the patra and the individual combined with confessional quota. Public administrators pay loyalty to the patra more than public organizations or local governance. The bureaucrat, manager, or clerk, is apt to break the law, prioritize workflow, take bribes, and serve only those who placed them in the position.

In a strong patriarchal society, as in the Middle East and Lebanon in particular, identity formation and behaviors are shaped by kinship affiliation.^[6] The patriarchal belief system permeates the social, economic, and political institutions, and not only legitimizes but also elevates the role of the patra over the legal system.^[7,8] In collective spirit, individual commitments to the kinship group or confession supersede legal frameworks and concrete rules. In addition, in many areas of the Middle East, traditional behavior outpaces legal standards and rules, and the protection of tribal or confessional values displace national and international legal ones. In almost all cases, state or government plays a role in the proliferation of tribal and patriarchal interests through promotion of patron–client relations based on the exchanges of goods where the patra receives benefits in exchange for bribing government officials, whether *Baksheesh* or personal favors. Public employees may be assisted by politicians and people of influence to perform acts of corruption only to benefit in the form of monies and favors. When the issue is less politically salient, bribery can prove to be the most efficient mean for citizens to cross all types of sectional, sectarian, institutional, cultural, and organizational barriers and receive the best public service on time.

THE EFFECTS OF CORRUPTION: ECONOMIC DETERIORATION

Money made through corruption by individuals or groups is rarely invested back into the economy. It

rather distorts economic growth and development and eliminates the poor share in the greater wealth made from it.^[9] The impact on the allocation of funds from the productive sectors to consumption shifts the nation’s developmental course toward a consumer-dependent type of economy. The severity of corruption can be calculated through government collusion with private or individual interests where money and resources are diverted to nonproductive sectors like the military or security forces.^[10] For instance, most Middle Eastern countries have an exceptionally high level of military spending. A country like Lebanon whose military prowess is limited in comparison to regional powers, and experiencing a national debt of almost 40 billion dollars at the end of 2005 (seven times its yearly revenue), had a military budget in 2003 roughly equal to 10% of its budget expenditures.^[11] Despite the high spending on the Lebanese armed forces, the rise and continuation of militias supported and financed by regional forces continue to develop into political institutions independent of state control.

In essence, the huge economic damage produced by corruption in Lebanon is felt within the service sectors whether health, agriculture, energy, communications, finance, education, welfare, environment, or transportation, and is reflected in government debt. Officials may receive large payments to sign off on incomplete, ill-finished, below standards, or even non-existing projects, as in waste management or to monopolize markets such as the case of the two major cell-phone companies and their control of the cell-phone industry. In addition, a large black economy still thrives through the Lebanese–Syrian border: costing the government unrealized revenues in the form of tariffs, adding to market asymmetry, the development of monopolies, and the increase in negative externalities.

CONCLUDING REMARKS

Political and administrative reform is at the heart of political discourse in Lebanon in the wake of large economic scandals unfolding in many governmental and non-governmental institutions. The Syrian military and intelligence withdrawal from the Lebanese political and social scene and thriving political competition make reforms easily attainable with international actors showing renewed interests in the country’s public sector. A balanced use of discretion, ingrained public administrative constraints, citizen activism, and political restructuring, can possibly contribute to create a modern public administrative program with an entrepreneurial sense of public management.

In addition, demand for access to information has shaped public opinion and caused the formation of a national consensus on the anticorruption discourse.

The media, sectarian and political in its composition, has often promoted ahead of grass root movements and government, transparency through exposures, and investigative reporting.

The national consensus rallying behind Syrian withdrawal from Lebanon opened opportunities for a new era based on the clean conduct of politics, transparency, and accountability. However, external forces continue to impact the political process and governance in Lebanon. Despite the departure of Syrian military and intelligence forces from the country, their impact is still felt in many political, economic, and public security organizations. In addition, the Iranian funded Hezbollah continued to make decisions independent of the Lebanese state, which ignited in July 2006 an open Israeli war on Lebanon and the more recent, summer 2007 showdown between the Lebanese army and Al-Qaeda inspired "Fath Al-Islam" led to the destruction of many of its roads, communication, and economic infrastructures. In the wake of external forces impinging on Lebanese society, international efforts (EU and UN) have intensified to impact governance in Lebanon.

In addition to these external political factors, a dysfunctional Weberian organizational structure makes administrative reforms, whether incremental or radical, difficult to achieve in the short run. Prospective grass roots movement and civil society at large are laboring for genuine anticorruption educational programs perpetuated by a general political will and aimed at societal transformation and administrative reforms.^[3,12]

Legal Ethics

Christina M. Bellon

*Department of Philosophy, California State University, Sacramento,
Sacramento, California, U.S.A.*

INTRODUCTION

Legal ethics refers to the body of codes and, in some cases, statutes that define and regulate the professional practice of law. Legal ethics also has a normative meaning expressed in the branch of applied or professional ethics that studies the connection between legal practice and the principles that *should* govern such practice. These two aspects of legal ethics are not independent of one another. This is most clearly evident when existing codes of conduct are revised or modified to better express the legal profession's or society's views about what those ethical standards ought to be.

Legal ethics is about trying to ensure that the practice of law is consistent with the ends of law; that is, to ensure ethical practice in the attainment of just outcomes. Its public policy import is best expressed by David Luban, "[O]ur nation is so dependent on its lawyers that their ethical problems transform themselves into public difficulties. Put simply: the ethical problems of lawyers are social and political problems for the rest of us."^[1]

CODES OF CONDUCT FOR LAWYERS

The organized regulation of legal practice has only a recent history in the United States. Prior to 1908, when the American Bar Association (ABA) issued its 32 Canons of Professional Ethics, no formal rules of conduct were available to guide lawyers in the ethics of their practice. These canons served this function until they were replaced in 1969, when the ABA issued its Model Code of Professional Responsibility. The Model Code was fairly rapidly adopted by most states as the binding standard for ethical conduct by lawyers practicing within their jurisdiction. Shortly thereafter, in 1983, the ABA issued its most recent set of ethical rules, the Model Rules of Professional Conduct. By the mid-1990s, most states had adopted the Model Rules;^[2] however, these are only models. Any proposed code of conduct becomes binding on practicing lawyers only after a state's highest court has adopted it, usually

after considerable modification. Of course, a particular state's bar association and its highest court may opt to create a distinct code of ethical conduct for lawyers practicing within its jurisdiction, as is the case with California. Or it may create a code from a combination of those available to it, as is the case with New York's blend of the Model Code and Model Rules. Once a state has adopted a code, the authority to hear complaints against specific legal professionals is typically delegated to the ethics committee of the state bar association. In this way, the legal profession is self-regulating. Those persons who practice as professional lawyers are required to adhere to the code of ethics as adopted by the state in which they practice.

Adherence to the ethical requirements of the profession is mandatory for each practicing lawyer. When legal professionals fail to adhere to the requirements of the code or rules governing the practice of law, they may receive significant penalties ranging from private or public reprimand to suspension or disbarment. The most severe penalty, disbarment, not only deprives practitioners of their livelihood, but more important, from the point of view of a self-regulating profession, they have been barred from the legitimacy the profession conveys upon its members. In the disciplinary setting, the connection between ethics and the professional (i.e., legitimate) practice of law is most clear.

For lawyers, ethical conduct is not simply wishful thinking nor is it optional. Rather, it contributes to the very understanding of legitimate, authoritative, and professional practice. According to the Preamble to the New York Code of Professional Responsibility,

But, in the last analysis it is the desire for the respect and confidence of the members of the profession and of the society which the lawyer serves that should provide to a lawyer the incentive for the highest possible degree of ethical conduct. The possible loss of that respect and confidence is the ultimate sanction.^[3]

Adherence to the requirements of the ethical code, from the practicing lawyer's point of view, serves as a mark of professional conduct. From the client's point of view, it is a surety to instill confidence in the professional conduct of the legal advisor.

Additional Regulation of Lawyers' Conduct

What other means are available for the ethical regulation of lawyers? The ABA Model Rules is not the only document that governs the conduct of legal professionals. More specialized codes are occasionally issued by professional legal associations, some of which have been adopted by state and federal courts. Among these are specialized standards and rules governing practice in securities law, and governing the behavior of prosecutors and attorneys general. State governments may enact statutes governing legal malpractice, rules of evidence, disclosure and other trial procedures, antiracketeering, and conflicts of interest, just to name a few. The Constitution of the United States is also a basis for justifying certain prohibitions or limitations on legitimate legal practice. State and federal courts have interpreted the meaning and significance of many of the rules of the Model Code and Model Rules. Further, and perhaps most directly, individual courts can find and impose penalties for unethical behavior. For example, lawyers who act contemptuously in the courtroom may be found in violation of the state's rules of professional conduct and immediately be sanctioned or otherwise punished by the attending judge.^[4]

LEGAL ETHICS AND THE PUBLIC GOOD

To understand the public policy implications of legal ethics, one must first understand the relation between lawyers and the larger public they serve, and between the ethical requirements of legal practice and the broader ethical concerns of the public. For example, the New York Code claims no less than that the proper and just functioning of a free and democratic society depends on the right conduct of legal professionals. "The continued existence of a free and democratic society depends on recognition of the concept that justice is based upon the rule of law Lawyers, as guardians of the law, play a vital role in the preservation of society."^[3]

As public policy considerations suggest, understanding the ethical regulation of lawyers requires an appreciation of the context in which law is practiced. The institutional setting for the practice of Anglo-American law and common law in general is the adversarial system. In addition to the adversarial system, an appreciation of the function and purpose of lawyers within that institutional setting is also helpful. The combination of the adversarial system and the lawyer's role within it contribute to a better understanding of the ethical dimensions of the relationship between the practice of law and the attainment of justice.

Adversarial System and Individual Rights

Among the central tenets that frame the practice of much of the law in the United States and that therefore provide the context against which ethical considerations must be evaluated, is the adversarial administration of law. According to Luban, the adversarial system is distinguished from other systems of law by the following features: "an impartial tribunal of defined jurisdiction, formal procedural rules, and . . . assignment to the parties of the responsibility to present their own cases and to challenge their opponent's."^[1] For the purposes of a discussion of legal ethics, the latter feature is most significant. The responsibility of parties to present their own cases and to challenge the opposing party's case imposes on lawyers for each party the following duties: the duty of partiality to the client's perspective and interests, the duty of confidentiality, and the duty of zealous advocacy of the client's legal interest. These are the three fundamental duties of lawyers in an adversarial system of law.

The adversarial administration of law is typical of most common law legal systems, although the alternative inquisitorial model is dominant in countries with histories tied more closely to the civil law tradition. Most nations whose modern administrative and legal systems have been inherited largely from the British through colonial expansion and settlement employ some variation of an adversarial legal system. Many other nations, for example, France and Germany (and those nations that have inherited the French or German administrative systems through colonial or other means), have legal systems based on the inquisitorial model. The inquisitorial system affords lawyers a lesser role, the judges a greater role, and requires the disputing parties to cooperate in the impartial search to uncover the truth of the matter by neutral investigation.

The adversarial model, however, assumes that truth will come through the rational, rule-governed, presentation and challenge of facts by partisan parties. According to Lawrence Friedman, the adversarial system is characterized as the sort of system in which

the parties (and their lawyers) control the case. They plan the strategy; they dig up the evidence; they present it in court. The two sides battle it out mainly by putting witnesses on the stand and asking questions The judge sits on the bench, more or less in the role of an umpire. He or she sees to it that both sides obey the rules of the game.^[5]

This characterization is most appropriate to the operation of the criminal legal system, but is less descriptive of the practice of family law and of the juvenile justice

system. Both of these specialized areas of law are less adversarial than the criminal law. The former results from recent modifications to increase the settlement of disputes via mediation; the latter, by design, is a means to ensure the protection of vulnerable and inexperienced children. However, the juvenile justice system has become increasingly adversarial as the parties involved seek to protect the expanding rights of individual children accused of criminal or otherwise deviant behavior.

The justification for the adversarial pursuit of justice is that it is a more fair and equitable means to attain justice for the individual parties to the dispute. Indeed, Monroe H. Freedman, one of the strongest proponents of the adversarial system, characterizes it with the following claim, “Let justice be done—that is, for my client let justice be done—though the heavens fall. That is the kind of advocacy that I would want as a client and that I feel bound to provide as an advocate.”^[6] Indeed, he continues, the inherent fairness of the system comes from the claim that “[t]he adversary system not only takes the fact of disagreement into account, but takes advantage of it to produce a judgment informed by contrasting points of view. In doing so, the adversary system serves the public interest in a unique way.”^[6]

To underscore the close connection between the duty to zealously represent one’s client, the centrality of the adversarial process, and the larger public good the New York Code presents the matter thus,

An adversary presentation counters the natural human tendency to judge too swiftly in terms of the familiar that which is not yet fully known; the advocate, by zealous preparation and presentation of facts and law, enables the tribunal to come to the hearing with an open and neutral mind and to render impartial judgments. The duty of a lawyer to a client and the lawyer’s duty to the legal system are the same: to represent the client zealously within the bounds of the law.^[3]

In this way, the New York Bar envisions the relation between securing rights for individuals as parallel to securing the public good. The adversarial system combined with the duty of zealous representation ensures, so the reasoning goes, the best interest of the public as a whole because it preserves the proper functioning of the legal system. To reiterate the point that Monroe Freedman makes, this is the sort of representation we each are entitled to expect from our lawyer and it is what each would want “if we should come to need our own champion against a hostile world.”^[6] In this way, the strongest justification of the adversarial system is political. The struggle is between the individual and other possibly hostile, but at least contrary individuals. The struggle may take place between even

less equal parties as, for example, between the individual and the state. In this view, the preservation of both the individual client’s rights and the public good requires a strong and zealous defense by lawyers whose duty is to their client alone.

Indeed, it is because of the constitutional weight given to the protection of individual rights and to the duty of lawyers to defend their clients’ rights that the adversarial system is dominant in the United States. Wherever it is found, the adversarial system demands that lawyers secure the individual rights of their clients through the zealous defense of their clients’ claim against the possible claims of others. As a lawyer, then, the right thing to do is to serve one’s client to the limits of the law, to the limits of professional ethics, and if necessary past the limits of public morality. It is at the juncture of risking or threatening to pass the limits of public morality that the limits of formal legal ethics appear. Critics of the adversarial system are troubled that it necessitates circumstances in which a lawyer must choose between being a good person and being a good lawyer.

Role Morality and Moral Responsibility

After considering what lawyers’ duties to their clients are in an adversarial system, we should consider whether any ethical considerations might limit the zealotry of their advocacy. According to the ABA Model Rules,

[a] lawyer’s responsibilities as a representative of clients, an officer of the legal system and a public citizen are usually harmonious. Thus, when an opposing party is well represented, a lawyer can be a zealous advocate on behalf of a client and at the same time assume that justice is being done.^[7]

However, the actual experience of practicing law in an adversarial setting does not always lead to this anticipated harmony of the client’s interest in justice in their own case, the lawyer’s interest in succeeding as an ethical professional, and the public interest in justice and fairness according to law. Indeed, the ABA Model Rules are intended as a guide for those occasions when this harmony is undermined. The Model Rules are intended to guide scrupulous lawyers to identify their duties and thereby to determine what course of action they ought to take to resolve ethical conflicts. The concern about the conflict between role morality and public morality exposes the limits of the ABA Model Rules and of any other ethical codes governing the practice of law in an adversarial system. Here, we should ask, “Can a good lawyer also be a good person?”

Several scholars of law and ethics have attempted to answer exactly this question. Luban argues that, in practice, being a good lawyer often is antithetical to being a good person. The ethical (and constitutional) requirement to render a zealous defense of a client's rights often requires that a lawyer forego the requirements of conventional (i.e., public) morality. Why is this so?

An important feature in discussions of legal ethics is role morality. Role morality refers to the moral conduct required of individuals as they perform specialized tasks typically associated with a defined social role. This approach finds its roots in the work of Niccolo Machiavelli, a sixteenth-century Italian philosopher of politics.^[8] The virtuous ruler (Prince), he argues, must forego the ordinary virtues of the good man and do what is necessary to his function as ruler. The job, it would seem, is not for the morally squeamish. Similarly, discussions of legal ethics often turn to a consideration of the role morality of the legal practitioner. For practicing lawyers, the requirements of the role are such that one must be willing and able to do what under other circumstances would be considered immoral or lacking virtue. Consider the lawyer defending her client in child custody hearings, but whose client is also a convicted child sex offender. Acting as a good lawyer, she owes her client the fullest and best advocacy of his interests. But as a good person, the lawyer may well find the thought of placing children in her client's custody to be morally reprehensible. She may rightfully worry that she would share responsibility for any harm that comes to the children once they are returned to their abusive father's custody, if she is successful in acting as a good lawyer should. This is the kind of dilemma raised by considerations of role morality in legal practice.

There are two broad approaches that can be employed in an attempt to reconcile the role morality of lawyers with the public morality of the society in which they practice. One is to argue that the role morality of legal professionals be brought into line with a universal, enlightened, and rational morality that places social justice at its center. The second is to argue that the role morality of legal professionals be made flexible so as to be consistent with the individual conscience of legal practitioners and the values of the community in which they work. The first position is reflected in the work of Richard Wasserstrom,^[9] the second in that of David Luban.^[1]

Wasserstrom suggests that the ethics of legal practice ought to be made compatible with a universal justified morality. He suggests that the public good, and individuals who comprise the public, would be better served by lawyers who "see themselves less as subject to role-differentiated behavior and more as subject to the demands of the moral point of view."^[9] If some

behavior otherwise required in the defense or advocacy of a client's rights violates a justified universally applicable moral principle, then that behavior ought not to be undertaken by the lawyer. If a lawyer cannot advocate or defend a client's interests without such violations of morality, then such defense of the client's interest must be contrary to the requirements of morality. An immoral interest cannot generate morally defensible rights and is inconsistent with justice. Successful advocacy of the client's interests would, therefore, be contrary to the requirements of justice. Here, the criticism is not that lawyers fail to follow any justified moral principles. Rather, the concern is that even *ethical* legal practice is itself unjustifiable in larger moral (rather than role-related) terms. If the practice of law is itself justified by its relation to the pursuit of justice, then a corrective would lie in making ethical legal practice consistent with universal morality.

This line of criticism raises concern about the morality or justice of ethical legal practice. The problem, as Luban and others see it, is that the practice of law is too far removed from the professed ends of justice so long as lawyers (as practitioners of the law) are understood to act according to a separately justifiable and independently derived morality that is separate and independent of the morality to which ordinary persons are expected to adhere. This criticism is posed as a problem not only for the legal profession, but also for public policy. If lawyers are held to a different moral standard in the attainment of justice for their clients and if that standard is morally questionable *but not in violation of ethical rules of conduct*, then how can the public be certain that justice will be secured? The problem is a perfect example of the moral disparity between identified ends (justice) and the means by which those ends are attained (zealous adversarial advocacy). Can a just end be attained by unjust or immoral means?

Monroe Freedman addresses the problem by resisting the move toward requiring lawyers to adhere to either the publicly accepted morality or some enlightened universal morality. His reasoning hinges on the centrality of the value of individual client autonomy. For lawyers to act according to any morality other than the ethical standards of the profession and the client's own moral values is to subject the client to paternalism. The ethical problem presented by paternalism is its violation of individual autonomy. To behave in this way is to encourage lawyers to supplant their own moral values or point of view for their client's.^[10]

The virtuous or good lawyer is not, on Freedman's account, so distinct from the virtuous person. Indeed, the role difference between lawyers and non-lawyers is significant. Roles can make all the ethical difference. Often individuals are held to differing standards of

conduct according to the socially determined role each occupies. Consider the following analogy. As a friend, we have an obligation to console in times of loss, which a stranger does not; a friend has duties to another friend by virtue of the special relationship of the friendship. We would neither expect nor feel justified to cajole a stranger to listen to our troubles, but we do so of friends. Freedman argues that lawyers, not unlike friends, have special duties to their clients because of the role lawyers occupy in the legal system. Their special training, their privileges of education and professionalism, and their special charge as proponents and advocates of the law, generate for lawyers duties to act in ways we would not, indeed could not expect of non-lawyers.^[10] For lawyers to do otherwise would be for them to fail in their appointed responsibilities not only to their clients, but also to the larger public. Freedman, among others, argues that zealous advocacy in the defense of the rights of individual clients serves the larger public interest because each one of us would want and is justified to expect our own lawyer to do just this in defense of our own rights, should the need for such defense arise.

Special Duties of Prosecutors and Government Lawyers

However, even so staunch a proponent of zealous adversarial advocacy as Freedman recognizes that there may be circumstances in which a lawyer has a larger duty to justice than only to his particular case or client. This is routinely the situation for public prosecutors and other government lawyers. Here, the public policy concern that the ethics governing the means of legal practice correspond closely with the larger conception of social justice is clearest. We may not all agree that individual defense attorneys or divorce lawyers have an ethical obligation to act so as to attain the greater justice of the community when this conflicts with their clients' interests. But, when the means pursued by the public prosecutor fail to serve the larger public good, then they fail to meet the requirements of social justice. In such circumstances, all members of the community have cause for concern.

Of course, public prosecutors must adhere to the ethical rules incumbent upon all practicing attorneys. But, by virtue of the prosecutor's role and relative power as representative of the state's interest, prosecutors have a special duty to ensure that the effect of their actions is to attain justice in so far as the law permits. The duty of prosecutors is not simply to win the conviction, but to ensure that the conviction once won is also a just conviction. Depending on the particular situation, this duty to ensure that the broader public good is served through each prosecutorial action

results in special duties incumbent upon prosecuting attorneys from which non-prosecutorial and non-governmental lawyers are exempt.

The special duties of prosecutors derive principally from the several discriminatory powers typically the preserve of clients in non-criminal matters. First, prosecutors have the power to direct criminal investigations. Second, they have the power to define the crime to be charged. Third, they have the power to affect punishment upon conviction by making recommendations to the court, by arguing for one sort of punishment or another, or persuading the court toward more lenient or more harsh penalties. Finally, and perhaps most important for the attainment of social justice, is the power of governmental lawyers to decide whether to prosecute a particular crime or individual at all.

Each of these powers can be misused or abused perhaps innocently, as in the zealous attempt to secure the public from the ill effects of crime, or more maliciously, as in the selective prosecution of politically unpopular individuals. In either case, the ethical concerns at issue for government lawyers are substantially greater than for non-government lawyers and this is due to the additional discretionary powers with which they are vested. The requirements of the ABA Model Code are clear, and there is near consensus on the matter in the ethics literature.

The discretionary powers of prosecutors ought to be used to effect the public good. Prosecutors who use this power well can enhance public confidence in the prosecutor's office, as well as improve the public's confidence in the legal profession as a whole. It is important to understand that these special discretionary powers reflect prosecutors' positions as advocates on behalf of the public as a whole and of the state, and whose duty it is to uphold the public interest in health, security, and especially justice. In civil law, parallel discretionary powers are vested in the client.

LIMITS OF LEGAL ETHICS

What appears from the above discussion of the relation between legal ethics and the public good are two important limitations on the effectiveness of any ethical regulation of legal practice. These include intention and knowledge.

Intention and Motivation

According to self-imposed standards for prosecutorial conduct, prosecuting attorneys are to pursue only those charges they reasonably believe are substantiated by available evidence and they are not to use inflated charges as leverage to coerce testimony.^[11] But how

is it possible to ascertain the purpose for which a prosecutor decides on one charge instead of another? This problem is a problem of intention, and is well known in moral and ethical discourse generally. The problem stems from the related metaphysical and epistemological problem posed by “other minds.” In philosophical discourse, the problem of other minds refers to the difficulty we each have in ascertaining 1) that other humans have minds “like I do,” and 2) what the content of another human’s mind might be. The content of a human’s mind refers to the beliefs and values that inform moral thinking, which in turn informs moral action.

As for many other areas of ethical inquiry, assessments of intention are often reduced to assessments of action and its consequences. Individuals are often unclear as to their own intentions when engaged in complex activities; this is no less true for practicing attorneys, whether they are prosecutors or not. Generally, only two avenues are available to determine what a person’s intentions are: 1) the person’s own declaration about what was intended; and 2) the act in which the person is engaged. Both these avenues are indirect and somewhat unreliable. A prosecutor brought before a disciplinary hearing may declare that the intentions were noble and moral, and were truly in accordance with the requirements of ethical conduct. But, the effect of what was done may indicate otherwise. In this way, the two available means by which to ascertain the lawyer’s intent may contradict. The personal declaration points to lacking intention (say, to introduce a perjured testimony), but the actions point to intention (perjured testimony was introduced at trial).

Attorneys may be motivated to do what is right and clearly intend to act accordingly, but nonetheless they may engage in actions that have negative legal consequences. One way to view the requirement that lawyers act according to ethics codes and rules is as an exercise in deontological ethics. According to Kant, the moral worth of an action does not lie in “the purpose to be attained by it, but in the maxim in accordance with which it is decided upon.”^[12] In other words, the goodness of my actions should not be determined by the consequences that result, but by the motivation I follow in acting as I do. If a lawyer acts according to the ethical rules yet those actions result in detrimental legal effects (e.g., perjured testimony is entered as evidence leading to an innocent person’s conviction), it is the lawyer’s motivation to follow ethical rules that should determine the moral quality of the resulting actions. However, motivation and intention are difficult to ascertain.

The problem of intention and its correlation with deontological ethics points to one of the weaknesses of deontological approaches to professional ethics. Following the rules, acting from duty, and acting with right motivation do not ensure right conduct. Instead

of focusing on the following of rules and relying on the good motives of lawyers (especially when their actions are detrimental to the legal system), lawyers ought to determine right actions by their good consequences regardless of the motivations for acting. This teleological or consequentialist alternative allows more concrete determinations of good conduct by focusing ethical attention on the effects of actions. On this account, lawyers can act ethically and bring about good consequences, even if their motivations for doing so are less than virtuous (in terms of either role, universal, or public morality). It is at this point that a discussion of legal ethics becomes involved in problems of ethics more generally, and these are problems of a more theoretical rather than practical nature. It also leads the discussion of legal ethics full circle, in another form, to revisit concerns about the ends of the practice of law, that is, about justice.

Problem of Limited Knowledge

The problem of limited knowledge also has philosophical roots. One of the most obvious ethical claims, almost itself a truism, is that a person cannot be responsible for what she does not know. Individuals can only be guided in their actions by what they know or have good reason to believe is true. If the bridge is out, but I do not know this and direct you to take the bridge to return to the highway, I cannot be responsible for the harm that befalls you when you drive off the bridge. Or can I? This problem is well known to ethicists and to lawyers alike. In law, culpability (responsibility for the ill effects of one’s actions) is often contingent upon the degree of knowledge an individual has about the relevant circumstances. Similarly, the rules governing ethical legal practice often contain an epistemological qualification. For example, lawyers should not allow testimony *they know is false* to be entered as evidence. If they do not know the testimony is false, have they violated the ethical prohibition by allowing the testimony?

The ethical worry seems to be that attorneys, aware of the reduced ethical responsibility that comes from ignorance, may make themselves willfully ignorant of some facts of their cases to ensure that they have not behaved unethically. The willfully ignorant lawyer is one who does not want to know and so does not pursue the truth of the matter regarding a witness’ testimony, for example. If the lawyer knows the testimony is false, then it should not be used in pursuit of the client’s interests. If the lawyer does so nonetheless, disciplinary proceedings and punishment might result. If the lawyer does not use it, the client’s case might be lost. The willfully ignorant lawyer is free, it seems, to use the otherwise suspect testimony as part

of a zealous representation of the client's interest. But, is the lawyer responsible for this willful ignorance and the possible detrimental effects of acting on it?

The distinction between innocent ignorance and willful ignorance, similar to the determination of intent, is not always evident and its moral status is somewhat controversial. This problem raises questions as to the criteria for knowledge. One familiar criterion is the reasonable person standard: a lawyer is responsible for acting when information to guide that action would be known by a reasonable person. A slight modification of the reasonable person criterion is reasonable expectation. A lawyer, *with* special training, experience, and access to information, is reasonably expected to know more than a reasonable person *without* such training and experience. Willful ignorance is less appealing as an ethical loophole if additional criteria of knowledge are employed.

CONCLUSION

The practice of law holds a privileged place in the social trust. The law is often the practical determinant of justice. The practice of law, then, is reasonably associated in the social conscience with the attempt to ensure some means for securing justice within a given society or community. At the very least, individuals tend to retain the services of legal professionals in the narrower pursuit of justice in their own case. For the individual members of the public, the law is often most personally and concretely represented by individual lawyers. For the legal profession, then, the ethical requirements of practice are closely associated with the attainment of justice in some form. Legal ethics is about ensuring this connection both through the regulation of professional legal practice, and through the normative discourse that critically evaluates actual practice and proposes to remedy the practical and theoretical limitations of such regulation.

Life Cycle Costing

INTRODUCTION

Governments usually purchase goods and services through competitive bidding processes. However, government contracts are often awarded solely on lowest purchase price basis. The initial acquisition price does not reflect the recurring cost of operations and maintenance. Nor does it include the potentially large disposal liability, if environmentally hazardous materials are involved. Life cycle costing (LCC) is a technique used by government and business to determine the total cost of ownership. The results of an LCC analysis can be used to assist management in procurement decision-making.

This article introduces the LCC concept and its application. It first outlines the principles and processes of LCC. It then reviews the history and the evolution of the concept. It puts the technique in context by listing its problems, solutions, and current applications. It concludes by suggesting extended application of LCC as a decision-making tool in public purchasing and beyond.

WHAT IS LIFE CYCLE COSTING?

Life cycle costing is an application of present value concepts principally to purchasing decisions, although it may be applicable in other settings. The core idea is that minimizing the purchase price can be dysfunctional because other necessary costs may negate the advantage of the lowest purchase price of a good. For example, in anticipation that a good might be purchased at the lowest price, a manufacturer might use substandard materials or inadequate design, reducing manufacturing costs and allowing a low selling price. However, these shortcuts might result in such auxiliary costs as high maintenance or operating costs, short product life, low residual value, or high disposal cost. Once these additional characteristics are considered, the decision to select on lowest purchase price alone is revealed to be an ineffective use of resources.

Life cycle costing may sound exotic, but it is actually quite common. The concept can be used at home

and in institutions, in the private sector and in the public sector, in consumption and in production.^[1] For example, the energy efficiency ratings marked on major electronic appliances sold in the United States are simply a clever way of communicating a component of LCC information to the appliance market. The selection of building materials based on initial and operating cost in school construction is an example of LCC in public sector capital budgeting.^[2] The evaluation among various product lines based on total costs is an example of the application of LCC in private enterprise investment decisions.^[3]

HOW DO I PERFORM LIFE CYCLE COSTING?

Life cycle costing requires two basic steps. First, one must determine all costs associated with the purchase, ownership, operation, maintenance, disposal of wastes, and disposal of a product. In general, LCC is applied as a microeconomic concept, not as a public policy concept, so only direct costs are considered. Each cost must be estimated both in amount and in time flow, unless the time period is quite short. Second, the time flow costs must be discounted to present value.

As an illustration, a simplified life cycle cost of a project can be calculated using the formula:

$$\text{Life cycle costs} = A + O + M + D$$

where A is the acquisition cost of a project, which includes the initial capital expenditure for facilities and equipment, the system design, engineering, and installation. These costs typically incur at the beginning of the project. O is the operating cost, which is total operation labor cost, energy cost, material cost, overhead cost, etc. discounted over the life of the project. M is the maintenance cost, which is the total maintenance and repair costs discounted over the life of the project. D is the disposal cost, which incurs when the project involves toxic material that impact on the environment. Disposal can also be a benefit when the project has a terminal value, which is its present

value of the project in the final year of the life cycle period.

The present value of a cash flow in a future time must be discounted for comparison. The discounting process follows the time value of money principle. The project with the lowest life cycle costs is most cost effective, and should be considered among alternatives in purchasing decisions.

Sometimes, alternative projects produce goods or services of uneven quality and/or characteristics. In this case, it may be necessary to consider benefits in addition to cost; otherwise hidden costs in the form of unequal benefits may not be exposed. There can be significant unequal benefits when maintenance requires that a product be out of service or when there is a difference in the product capacity, output, life, or residual value/disposal cost. As with any benefit–cost analysis, these values should be monetized, placed in time, discounted to present value, given the appropriate sign, and added to the costs. To avoid misleading results, the costs and benefits should be separately revealed before they are netted together.

The recommended decision rule should be to purchase the product with the highest net present value, except where such nets are small in proportion to total flows. In that circumstance, other product characteristics may be more substantially considered.

A BRIEF HISTORY OF LIFE CYCLE COSTING

Life cycle costing is such a common sense approach that it has likely been around long before it gained a foothold in academic literature. That foothold is in the 1960s in the United States and the 1970s in Britain.^[4–7] Its formal development is at the Department of Defense (DOD) as an operations research method. In 1967, DOD solicited an operations research analyst in the Wall Street Journal, listing knowledge of LCC as an expected qualification. The implication of this job notice is that the term had substantial currency by 1967. However, the major business, finance, economics, political science, statistics, and history of science journals, as participating in JSTOR, list nothing before the 1970s. *Public Administration Review*, a non-JSTOR journal, has one brief mention of LCC in 1968 and associates it with total package procurement (TPP), which itself is not substantially older having one *PAR* citation from 1966 and one JSTOR citation in the *American Economic Review* from 1968.^[4,6,7] Interestingly, Neiburg's 1968 article, which is the first identifiable mainstream article that goes beyond merely mentioning these concepts, is primarily concerned about difficulties that arise with TPP in the defense environment.

Over the past 40 years, the basic character of LCC has not changed. What has changed is its application and devices for its communication. Life cycle costing began its existence as a technique in contract procurement to avoid perverse side effects of minimum bid purchase decisions. It has expanded into a consumer device to make better purchasing decisions and may sometimes be used as a device to require manufactures or other sellers to internalize costs that they typically try to evade by leaving as externalities. It has, thus, proved to be a useful and flexible device that extends beyond the public finance environment.

PROBLEMS AND SOLUTIONS

Life cycle costing is relative of net present value and benefit–cost analysis. It is, thus, subject to some of the same kinds of abuses that these might suffer. These include deliberate manipulation of discount rates, inaccurate estimation of some costs or benefits, the omission of sources of cost or benefit, and the inability to reach agreement on monetary value of some costs or benefits.

The solution to most of these technical difficulties can come in three forms: rules, sensitivity analysis, and audits. Typically, the federal government sets very clear guidelines on what discount rates may be used in present value calculations based on Circular A-94, http://www.whitehouse.gov/omb/circulars/a094/a94_appx-c.html. As LCC is not used in considering the tradeoff between the use of money for public or private purposes, the Circular A-94 discount rates may not be appropriate. The local government may be more interested in a discount rate that reflects its own cost of borrowed money. However, the discount rate should be set in advance of LCC at a fixed amount by decision-makers whose choice is unaffected in the outcome of the LCC analysis. Decision-makers should be particularly cautious of implausible discount rates when alternate product selections lead to sharply differing cash flows.

Uncertainty about costs can be addressed through sensitivity analysis. Sensitivity analysis consists of making estimates of several plausible levels: expected, somewhat lower than expected, and somewhat higher than expected. All estimates should be realistic; however, they may reflect the uncertainty surrounding unknown future costs and benefits. In sensitivity analysis, the product is fully costed at its expected cost and benefit and again at its lowest cost/highest benefit and highest cost/lowest benefit. With these three estimates in hand, the decision-maker is able to see to what degree the conclusion is robust. Sensitivity analysis

can also be applied to uncertainty concerning the discount rate.

Uncertainty about sources of costs and benefits can be addressed through independent review, auditing in some contexts. To be effective, this review should be genuinely independent. Independent review should also be considered for issues of discount rates and cost estimates.

The inability to monetize costs or benefits is more difficult to resolve. Empirical economists model and monetize many decisions that others find abhorrent to monetize, such as the value of human life. There are both moral and epistemological questions that render these results uncertain. The practice nevertheless persists. It is not proposed that this issue can be resolved in this article.

CURRENT APPLICATIONS

Although having a long history, the application of LCC is limited in public purchase decision-making. In addition to the theoretical, technical, and philosophical concerns depicted above, data quality and quantity limit its wide application. Researcher and analyst often find that relevant and timely data are not always available. The acquisition of the data can be costly and time consuming. Given that LCC is data intensive, lack of quality cost and performance data impede its application.

Moreover, the bureaucratic and legal constraints of governments could prevent the use of LCC. In many instances, the local government may require the selection of the least expensive options measured only in acquisition cost. Budget constraints also limit the use of life cycle cost, which, at a minimum, includes the cost of acquisition, operation, maintenance, and disposition.^[8]

Finally, like cost-benefit analysis, an LCC analysis is one piece of information that feed into the public decision-making. Many other considerations, political and bureaucratic, may enter the equation and determine the selection outcome. In the present highly politicized public service organizations, political considerations often overrun economic and efficiency concerns.

CONCLUSIONS

Life cycle costing is a powerful and yet simple device that can improve procurement decisions, aid consumers, and be applied in the public policy arena. It appears to be underused at this time. A number of approaches can be used to improve its utility in public

procurement decision-making. Education is often the key, as not all stakeholders are fully aware of the benefit of the technique, and not all government agencies are capable to apply it. Second, the regular collection of relevant, reliable, and timely cost data is prerequisite to its wider application. Without access to data, the application of this relatively data intensive techniques cannot be implemented. Third, the change of government purchasing by-laws and regulations from least bidding price criterion to life cycle cost will promote the use of the technique. Finally, public demands for government economy, efficiency and effectiveness promote the use of rational analytical techniques, such as LCC, that reduces long term costs for government services.

Like many management tools, LCC is alive and evolving. New and hybrid procedures, such as activity-based LCC, a combination of activity-based costing and LCC,^[9] have emerged in recent years. Many computer models have been developed to make these techniques accessible to government in-house application. As governments increasingly face tough choices under severe fiscal and economic pressures, and as the general public becomes more and more concerned of energy costs and environment issues, the future of LCC and its newly arrived derivatives, as a technique in public decision-making, seems to be very promising.

Linear Programming

Ronald John Hy

*College of Arts and Sciences, Texas A&M University-Kingsville,
Kingsville, Texas, U.S.A.*

INTRODUCTION

Linear programming (LP) is a set of mathematical optimization equations that are used to solve resource allocation problems; LP provides a narrow-range estimation when a course of action definitely leads to a given result, even though the range of that result is unknown before computation of the equations. The most important aspect of LP is that it provides a framework for making projections. That is, LP forces users to determine the objectives and constraints (restrictions that affect the possible solution) associated with estimations. Thus, LP helps users improve their planning skills by expanding their analytical capability and forcing them to state assumptions (objective and constraints) explicitly. LP, moreover, enables users to improve their estimation technique by requiring precise specifications of objectives, key variables, and crucial constraints. Such precise specifications help users understand the important ramifications and effects of each alternative course of action.^[1]

KEY CHARACTERISTICS OF LINEAR PROGRAMMING

Although LP is quite beneficial to the analytical process, users must remember that LP is foremost a quantitative technique and, as such, incorporates the following distinct characteristics:^[1]

- The problem must be formulated in quantitative terms.
- The problem must include at least two realistic choices among the proposed solutions. (No decision needs to be made when there is only one way to achieve an objective.)
- The problem must include at least one crucial constraint (any restriction that limits choice).
- The problem must have at least one optimal solution. (The solution must maximize an efficient course of action or minimize an inefficient course of action.)
- The key elements (the objective, variables, and constraints) must be measured in non-negative

numbers. (It makes absolutely no sense to talk about a negative solution.)

- The relationships among key variables must be linear. (Variables have to have a constant and reciprocal ratio.)
- The relationships among key variables must be additive, meaning that the total effect of the variables is equal to the sum of the effect of each variable.

CONCEPTUALIZING THE PROBLEM

The following steps are used to build LP equations:

- The objective of the problem (either to minimize inefficiency or maximize efficiency) is clearly defined.
- Key variables are specified.
- Constraints (the restrictions placed on the solution) are unambiguously developed.

LP is a set of iterative procedures that first satisfies all the constraint equations. This solution, then, is modified to satisfy the objective equation. The process is repeated until no further improvement is possible. Each iteration comes closer to the optimal solution until the optimal solution is reached.

Mathematical Notation

To use LP, the objective, key variables, and crucial constraints of a problem must be stated as mathematical equations so that the optimal solution can be computed. The first equation (the objective equation) states the relationship between the objective of the problem (minimizing inefficiency or maximizing efficiency) and the key variables. The other equations (constraint equations) specify the limitations imposed on the solutions. One constraint equation must be developed for each constraint.^[1]

Using mathematical notation, a set of LP equations is written as follows:

To minimize an objective:

$$Z(\min) = a_1X_1 + a_2X_2 + \cdots + a_nX_n \text{ (objective equation)}$$

Subject to the following constraints:

$$b_1X_1 + b_2X_2 + \cdots + b_nX_n > k_1 \text{ (constraint equation)}$$

$$c_1X_1 + c_2X_2 + \cdots + c_nX_n > k_2 \text{ (constraint equation) and so forth.}$$

To maximize an objective:

$$Z(\max) = a_1X_1 + a_2X_2 + \cdots + a_nX_n \text{ (objective equation)}$$

Subject to the following constraints:

$$b_1X_1 + b_2X_2 + \cdots + b_nX_n < k_1 \text{ (constraint equation)}$$

$$c_1X_1 + c_2X_2 + \cdots + c_nX_n < k_2 \text{ (constraint equation) and so forth.}$$

Where

a_1 = the objective value associated with the first key variable (X_1)

X_1 = the first key variable

a_2 = the objective value associated with the second key variable (X_2)

X_2 = the second key variable

a_n = the objective value associated with the last key variable (X_n)

X_n = the last key variable

b_1 = the value associated with the first key variable of the first constraint equation

b_2 = the value associated with the second key variable of the first constraint equation.

b_n = the value associated with the last key variable of the first constraint equation

k_1 = the minimal or maximal value of the first constraint equation

k_2 = the minimal or maximal value of the second constraint equation

c_1 = the value associated with the first key variable of the second constraint equation

c_2 = the value associated with the second key variable of the second constraint equation

c_n = the value associated with the last key variable of the second constraint equation.

Because LP problems often include hundreds of variables and constraints, a computer solution is a virtual necessity. Because of the iterative nature of LP, a variety of standard easy-to-use LP computer packages have been written. These LP packages usually can calculate problems involving more than 1000 variables and constraints.

Sensitivity Analysis

Sensitivity analysis answers the question: How much can the values associated with the key variables vary without drastically affecting the optimal objective? Because the values of the optimal solution often represent estimates, sensitivity analysis helps determine the range of the optimal solution. (Most LP computer solutions automatically yield sensitivity analysis information.) For instance, assume that the value associated with supplement *I* is three pounds. The optimal objective of \$560.00 can be maintained if supplement *I* is decreased by 0.25 pounds or increased by 0.21 pounds.^[1] That is, the optimal amount of supplement *I* actually can vary between 2.75 and 3.21 pounds without affecting the optimal cost (\$560.00).

Sensitivity analysis provides an acceptable range to the optimal solution. Such an analysis also facilitates determining the absolute maximum or minimum values that can be used without violating the constraints or objective. Obviously, the smaller the decrease and increase, the sounder the optimal solution.

LIMITATIONS OF LINEAR PROGRAMMING

LP is a powerful technique that can be used to make narrow range projections. Users, however, must be aware of the major limitations of LP if they are to fully understand and interpret the technique.^[1]

First, LP can only be applied to projections that have a single objective. Unfortunately, some projections frequently have multiple objectives. If general rather than specific objectives are sought, this limitation can be overcome. One way of dealing with multiple objectives is to develop a set of LP equations for each objective and determine via sensitivity analysis the range of each of the optimal solutions. The various optimal solutions then can be used as ballpark figures for making projections. Another way of dealing with multiple objectives is to use a more sophisticated LP format called goal programming. Goal programming lets users set upper and lower limits for each objective and then rank them in ordinal sequence. Such a format allows users to specify the extent to which each objective is expected to be achieved within the prescribed resource constraints.

Second, LP assumes the relationships among variables are linear. (This restriction exists for maximization and minimization problems.) Linearity assumes that all statistical relationships among variables are proportional; that is, the coordinates fall on a straight plane. If the linear relationships among variables cannot be assumed to exist, the LP solution is not useful. There are, however, various non-linear programming techniques that are similar to LP and can be used when

the relationships among variables are assumed to be non-linear.

Users must constantly remember that the optimal solution, though mathematically feasible, may not be socially desirable or politically viable. Moreover, it is often impossible to reconcile conflicting objectives. Consequently, an LP solution must be perceived as the starting point in an attempt to make projections. Armed with the optimal solution, users can then consider the myriad political and social factors before finally deciding the “best” solution.

LP is normally exceedingly complex, involving an enormous number of variables and constraints. The value of understanding LP lies in being aware of the

utility, applicability, and limitations of the technique so it can be used correctly. The procedures, concepts, and calculations employed to solve a problem can be applied to any projection, regardless of size. The only constraint on the size of an LP problem is the computer’s computational capability. LP is limited only by one’s imagination.

Local Governments: State Supervision of Budgets and Finance

Julia Beckett

*Department of Public Administration and Urban Studies, University of Akron,
Akron, Ohio, U.S.A.*

INTRODUCTION

States supervise local government budgets by requiring specific actions and procedures, by establishing and limiting revenue sources, and by monitoring and reviewing budget actions of local governments. States fulfill their responsibility to supervise in five ways: states enable, authorize, and empower local governments; states set budget controls and fiscal limits; states impose requirements and mandates; states employ administrative supervision; and states intervene in fiscal crises.

The state supervisory role depends on state laws and practices, as well as on the type of local government involved. The patterns and types of state supervision can only be described in general terms because there is great variety within the 50 states and more than 85,000 local governments in the United States. The types of local governments include counties, cities, towns, townships, school districts, and special districts. The jurisdiction of local governments may be based on geography, services, or population. Counties and cities are general-purpose governments, and they provide a wide range of services. In contrast, special districts often provide one service or function, and they are the most numerous and varied type of local governments in the United States. Within this diversity, states exert control over local government budgets.

One of the most important government functions is budgeting. Budgeting links the ability to tax and spend with managerial planning. Other governmental powers linked to budgeting include the ability to contract and to define and undertake activities. By enabling and defining local governments, states both empower and limit local government budget authority. Few states directly charter local governments and define their authority in detail; it is more common for states to have general laws that express broadly the extent of local governments' powers and functions. The techniques of state supervision range from general to specific, and the amount of control states exert over local governments ranges between loose and tight.

STATES EMPOWER LOCAL GOVERNMENTS

The intergovernmental authority relationship between state and local governments is first defined as that of

superordinate and subsidiary. This is often poetically stated as "local governments are the creatures of the states." This formal structure of power, also called Dillon's rule, is that local governments can be created or abolished by the state, and so they are subject to limits imposed by the state. States enable local government actions, including budgeting, spending, taxing, and borrowing. Local governments may exercise only those powers expressly granted by the state constitution or by state statutes. There is no common law right of local self-government, and local government powers to tax and spend are subject to state constraints.

In practice, states empower local governments through broad grants of powers; the specific type and manner of public activities undertaken are determined by local governments. The independent authority of local governments has been asserted through the use of municipal or county home rule charters, but this autonomy is limited. Some local government powers remain subject to preemption by the state. Quite often, even with home rule, states impose limits on local fiscal actions.

Although the hierarchical powers and derived authority description of local governments as being subsidiary and subservient to the states, the relationship between the state and local governments regarding budgets supervision is quite varied in practice. The manner that supervision takes is through intergovernmental techniques. State statutory authority of intergovernmental control is described in six major categories: 1) forms of government and home rule; 2) altering boundaries and responsibilities; 3) local elections; 4) administrative operations and management; 5) financial management; and 6) personnel management.

Commonly, supervision is defined as "directing the work or actions of another." The typical supervisory relationship is a manager and worker in an organization. This simple model of supervision within a hierarchical organization with centralized authority is, however, not consistent with American intergovernmental practices. In practice, state legislative and administrative review, oversight, and regulation of local governments are complex. States and local governments take cooperative, coordinated actions. State authority is often felt indirectly, rather than exerted directly. In practice, states and local governments work

as a partnership, addressing shared public problems with mutually developed policies.

States establish rules, regulations, and conditions within the political and administrative systems that affect local government budgets. State statutes spell out detailed and stringent requirements on local governments' budget and revenues. However, the intergovernmental supervision has indirect means of review or enforcement, which often relies on self-implementation of requirements by local governments.

States enable local government to try management techniques to reduce budget costs. States encourage coordination and networking of governments in risk or purchasing pools. States enable contracting out and other methods to reduce costs of service production or provision.

States supervise indirectly by their grants of authority, by revenue sharing, by requiring actions and services, and by requiring standard accounting and auditing procedures. States control local government budgets by setting specific limits on revenue sources and amounts. In addition, states engage in monitoring local governments by requiring them to file budget and fiscal documents. States possess the authority (although they seldom exercise it) to intervene directly and circumscribe local government budget actions.

STATES SET BUDGET CONTROLS AND FISCAL LIMITS

States exert control over four areas of local government financial management: 1) budgeting; 2) raising revenue; 3) issuing debt; and 4) financial reporting. These four inter-related categories are essential to local governments' budgeting and management decisions; yet, few states require a comprehensive approach to financial management. Most states' legislation requires local governments to enact an annual budget and sets requirements for that budget. The required budget information may range from a simple summary of revenue and expenditures to a detailed line item budget format. Local governments are commonly required to follow a three-step procedure—first submitting the proposed budget to the local governing body, then providing for a public hearing, and finally formally adopting the budget by motion and vote of the governing body. The enacted budget is often required to be filed with the state.

State-required budget actions include prescribing budget content, level of detail, timing, and processes. Some states encourage using program or performance budget formats. Other states may specify using a fiscal year or impose a calendar for considering and

enacting a budget. Often, the amount of information included in a budget varies by the size and type of local government, with more sophisticated approaches expected of larger city and county governments.

Some states institute more stringent requirements, using highly specified and detailed budget forms. Another stringent control prohibits local governments from making transfers between expenditure categories once a budget is enacted. Some states specify which local official, whether elected or appointed, is responsible for the form and management of the budget. These officers may have required qualifications such as certain training or experience.

State supervision over raising revenue takes various forms. It is common for state legislatures to institute stringent limits and controls on taxes and revenue sources for local governments. Types of statutory controls include limiting the types of revenues that can be raised, exempting some properties from the tax base, and placing caps on tax rates. States specify revenue types and sources available to local governments. Historically, property taxes were the predominant source of local government revenue and they continue to be the primary revenue source for school districts. State controls applied to property tax include methods of assessing property value, creating or denying exemptions, and limiting tax rates.

For local governments, other than school districts, revenue sources include sales, income, and excise taxes; non-tax revenues include user fees for services and enterprise funds. States exert budget spending control by limiting tax base or tax rates and, thus, limiting tax revenues collected. One stringent practice is indexing or limiting increases from previous years. States often earmark revenues by limiting the purposes that certain revenue can be used; for example, states may limit the revenue from gasoline taxes to be used for road repairs. States impose conditions for use of different types of taxes; an example is the centralized state collection of sales taxes.

An area of particular concern and attention is local government borrowing and use of debt to pay for expenditures. Many state provisions regulate local government borrowing based on the purpose, amount, and term of debt. Detailed conditions exist for both long- and short-term debts. Many states encourage local governments to institute capital budgets and to link long-range capital planning to managing debt. The particular processes and steps that states establish for local governments to enact budgets or borrow funds are often based on administrative and good government reform movements or are instituted by states in response to problems and scandals.

State constitutions limit local government budgeting, taxing, spending, and borrowing. The local

government-balanced budget requirement is the most well-known constitutional budget restriction; it requires that the local governments' annual operating budget to balance which is enumerated as planned expenditures must not exceed projected revenues and reserves. Another common constitutional constraint requires voter referenda to approve general obligation debts, and this serves to limit borrowing. Since the 1980s, in response to citizen tax revolts, many states have added constitutional provisions that require voter referenda before local governments can increase taxes or user fees.

The purposes for state controls on local government budgets and revenues are to impose fiscal restraint and provide public accountability. Many states instituted limits and prohibitions after public outcry. For instance, state limits on borrowing were adopted after numerous local governments defaulted on development bonds in the 19th century. State-defined budget controls and spending limits are intended to impose fiscal restraint; however, local governments often respond by circumventing the regulations and limits through innovations and creative financing. For example, the innovation of revenue bond financing removed the requirement of public acceptance and authorization of debt. Local governments issue revenue bonds to avoid exceeding limits on permissible levels of general obligation debt. The use of special district governments is also seen as a way for local governments to circumvent state-imposed limits on debt and budgets. Other innovations include increased use of fees for services, public-private partnerships, and shifting service responsibilities.

State fiscal reporting requirements also affect local government budgeting. To ensure uniform practices and to improve fiscal management of local governments, states require general fiscal reporting, book-keeping, accounting, and auditing standards. Historically, states required itemized budgets and detailed information to improve local governments' administration and operations. Revenue and borrowing provisions were enacted as constraints on local government spending. Financial reporting provisions also serve administrative functions for local governments and to provide information to the public.

State enforcement of budgeting requirements varies. Sometimes, there are statutory requirements for local governments, but no statutory enforcement mechanisms. Sometimes provisions are expected to be implemented by local government officials, with public pressure for compliance. Even when states have similar budgeting requirements, they may differ widely in approaches to ensure compliance. Whether minimal, advisory, or mandatory, these fiscal standards and practices affect the budgeting decisions and management of local governments.

STATES IMPOSE REQUIREMENTS AND MANDATES

One of the more contentious areas for local government budgeting in recent years has been the issue of mandates. State and federal government mandates have imposed increasing responsibilities on local governments, by requiring specific services, certain levels of public activity, or administrative procedures. For example, mandates concerning clean water impose new reporting and training activities, or mandates regarding public access require expenses of retrofitting buildings and sidewalks. State-required activities, services, or programs may be imposed through legislation, executive order, administrative rules, or court decree. The broad reach of mandates affects local governments by reducing discretion in service delivery and because the expenses entailed in satisfying mandates limit the personnel and resources available.

The controversy over mandates has frequently focused on whether the government that requires certain actions of local government should fund the required actions. Often, it is difficult to determine the costs and administrative burdens of mandates. For example, if a new state law requires local governments to install mechanical signs to warn of approaching trains for all streets that have railroad crossings at grade, then the question arises as to whether the state should pay the expenses for these signs. When states policies and citizen revolts have constrained revenue sources, mandates impose great pressures on local government budgets, because they require a greater number of expenditures.

State fiscal transfers and grants also affect local budgets. A major source of revenue for local governments has been state aid, and the timing and amount of this funding affects budgets. Grants-in-aid are awarded to local governments from state and federal programs. The direct conditions of grants may impose additional financial burdens in the form of requiring services, matching funds, or establishing additional procedures. Thus, in addition to general mandates, specific grants of aid have strings attached that serve to supervise local government practices.

STATES EMPLOY ADMINISTRATIVE SUPERVISION

States have administrative agencies that affect, advise, and regulate local governments both indirectly and directly. State administrative supervision of local government may range from informal advice to training, to periodic review, and to direct prior approval for local government action. Many states have administrative departments or divisions of local government

that provide general training, advice, and support for activities such as economic development, budget preparation, or database management. Some state agencies provide advice in response to local government requests. Oversight, in these cases, may be informal and non-directive.

Other state agencies may have direct regulatory authority, including setting standards and requiring actions of local governments. For example, state departments of education set standards and requirements for school districts. States may have regulatory agencies that can approve or deny local government fiscal activities; for example, some states have agencies that authorize local governments to issue securities such as bonds.

States also require local governments to file copies of the budgets and annual financial reports with an agency, often the state auditor or state treasurer. The requirement to file these budgets and reports serves three purposes: they impose managerial practices; they provide the general public access to information; and they enable state agencies to review for fiscal responsibility. The offices of state auditor and treasurer often serve as regulatory agencies in regards to the filing, form, and substance of local governments' budgets and financial statements.

STATES INTERVENE IN FISCAL CRISES

A fiscal crisis of insolvency, default, or bankruptcy raises grave concerns about the stability of a local government. In the event of a fiscal crisis, states take a more direct role in the management of the local government's budget. When audits reveal that local governments have troubled fiscal conditions of ongoing deficits or insolvency, states intervene in the day-to-day operations to achieve budget stability and fiscal solvency. Some states impose increasingly stringent reporting and filing requirements regarding the fiscally troubled local government's financial obligations, contract and purchasing actions, fund management decisions, and general operational decisions. Other states provide for receivers to take over the financial management and governance of insolvent local governments, and some states allow local governments to reorganize debts in bankruptcy litigation.

It is in fiscal crisis situations that states take the most directive role in a local government's budget and operations. This stringent and direct control is

temporary. Once the crisis is resolved, states return budget control to local officials.

CONCLUSION

State supervision of local government budgeting is complex and changing. In the federal system, states are expected to supervise local governments, and they employ various oversight techniques. In regards to the collection of revenue and the distribution of services, states affect local government budgets. States mandate functional and policy requirements that have serious budget implications. State supervision of local government taxing, spending, borrowing, and reporting includes both authorizing and setting limits on these activities. Through other means, such as giving advice, states exert control over local governments. The tensions between local governments asserting independence and states taking supervisory action raise continuing issues in intergovernmental oversight.

Local Services, Provision and Production

Robert M. Stein

Department of Political Science, Rice University, Houston, Texas, U.S.A.

INTRODUCTION

What governments do is significantly related to how they arrange for the provision and production of their functional responsibilities. There is evidence that links how governments arrange for the provision and production of their service responsibilities with the scope and content of their functional responsibilities and the efficiency, effectiveness, and citizen satisfaction associated with the performance of these functional responsibilities. In this article, I review the theoretical and empirical literature on the relationship between municipal functional responsibility and the means by which municipalities organize for the provision and production of their service responsibilities. My review of the literature is augmented with new analysis of functional assignment patterns and service arrangement data for a sample U.S. municipal government surveyed in 1997. The article concludes with a discussion of emerging research questions.

PREVIOUS RESEARCH

Savas^[3] and other researchers^[4–7] have argued that private vendors and not governments are invariably more efficient and effective producers of the goods and services provided by municipal governments. These researchers have marshaled empirical evidence that shows that private sector service producers are superior (i.e., more efficient) to public sector producers of the same goods and services (cf. Ref.^[6]). Others^[1,2,8,9] have suggested that the service producer and its sector location may be less significant than the mode of service delivery used by the city. Different means of service arrangements, both public and private, provide for greater efficiency in the provision of different goods and services. Given the content of the service/good and the nature of the market for service provision, the relevant issue in the debate about efficiency of municipal services is not whether government entities or private entities are more widely used, but whether governments have matched their service

responsibilities with the appropriate method of service arrangement.

Tiebout's^[10] model of local public expenditures has provided the theoretical foundation for most empirical research about the functional assignment patterns among municipal governments. Tiebout maintains that individuals select communities in accordance with their preferences for publicly provided goods and services, that is, "voting with their feet." The content and level of municipal service bundles is defined by the preferences of the median voter in each community. For Tiebout, an efficient market mechanism for the production of goods and services exists by virtue of: 1) the number and diversity of states and communities and 2) the mobility of voters to choose from among these communities the one that best approximates their preferences for community goods and services.

Tiebout's model of local expenditures is neutral regarding the content of governmental functional responsibility and similarly agnostic about what functions state and national governments should assume. Buchanan,^[11] Peterson,^[12] and Miller^[13] each introduce an important qualification to Tiebout's theory of local expenditures that significantly informed the debate on the scope of and content of municipal public policy. Each author notes that the mobility of consumer voters in a metropolitan area produces a significant bias for the retention of wealthier residents. Buchanan demonstrates that collective decision making under majority rule with equality of consumption and taxation will advantage low-income citizens at the expense of high-income residents. The result is income redistribution, a significant cost for middle- and high-income persons that can be avoided by the out-migration to another jurisdiction. Peterson further explores this bias toward the retention of wealthy residents. His thesis is "local politics is not like national politics," consequently "there are crucial kinds of public policies that local governments simply cannot execute."^[12] By inference, Peterson claims there are policies only the national government can efficiently perform.

Peterson maintains that the scope and level of a community's functional responsibilities are constrained by the inability of cities, and to a lesser extent states, to control the mobility of capital and labor across their respective borders. Though national governments can control the flow of capital and labor

This article draws upon the author's previously published work (see Refs.^[1,2]).

across their borders, states and cities are less effective at preventing their citizens, businesses, and capital base from migrating to other locales where tax-to-benefit ratios are superior. Consequently, governments seek to maximize their economic well-being by pursuing policies that enhance the economic base of the community, while avoiding those policies and activities that threaten the community with the loss of productive capital and labor. For cities, the pursuit of developmental policies (roads and highways) generates economic resources (i.e., tax base) that can be used for the community's collective welfare. Conversely, cities are expected to avoid redistributive public policies that benefit dependent and non-productive persons (e.g., welfare, housing, and health care), while drawing resources away from productive citizens without providing these persons commensurate benefits. Again, by implication, the responsibility for redistributive policies is less harmful to states and national governments because of the significant transaction costs associated with migration between states and nations.

The evidence to support Peterson's empirical hypotheses is mixed. Municipalities spend considerably more on developmental and allocation functions (road, street, water, and other infrastructure) than on redistributive goods and services (health, welfare, and housing). Peterson further shows that measures of demand (e.g., poverty, income, and the percent of municipal population that is African American) are unrelated to spending for redistributive social services. Stein^[1] reports, however, considerable variation in the range of municipal spending on redistributive social services. Many more communities than would be expected by Peterson and market theorists have an active role in the provision of social policies that are potentially harmful to interests of the city. Why?

As suggested above, there are several important dimensions to the debate over what functional responsibilities government should provide for their citizenry and how these governments should arrange for the provision of these goods and services. Different goods and services present cities with different challenges. Consequently, different strategies are needed to overcome these obstacles to the delivery of different goods and services.

The empirical question is whether there is an observable relationship between the attributes of different municipal service responsibilities and the method cities employ for the delivery of these service responsibilities. My thesis is that what governments do is fashioned by the means they employ for providing these goods and services. Efficiency and program effectiveness are maximized when functional responsibilities are properly matched with the optimal mode of service provision. This condition mitigates the income redistribution associated with municipal

service responsibility for many social services, enabling municipal governments to provide these services without suffering the significant flight of productive capital and labor. When functional responsibilities are matched with appropriate mode of service arrangement, many of the problems associated with externalities and other inefficiencies are eliminated.

THE ATTRIBUTES OF GOODS AND SERVICES

The failure of vendors, both private and public, to optimally produce specific goods and services derives from two traits associated with all goods and services: exclusion and jointness of consumption. The interaction of these two traits identifies four different types of goods and services, each requiring different institutional arrangements for their efficient service delivery.^a

Exclusion occurs when producers at a relatively low cost can deny buyers of a good or service consumption or use of the product. The absence of exclusion can lead to the production of externalities: "When the actions of one individual confers benefits or imposes costs on another individual for which no fee can be charged or no recompense collected."^b According to Peterson, it is the existence of externalities created by spending decisions of city governments that results in the flight of productive capital and labor. Specifically, cities actively pursue developmental policies (e.g., roads and highways) that generate economic resources (i.e., tax base) that benefit the entire community. Conversely, cities avoid redistributive policies that benefit dependent and non-productive persons (i.e., the poor) while drawing resources away from productive citizens without providing these individuals with commensurate benefits. These types of policies (welfare, housing, health, and hospitals) operate to encourage in-migration of unproductive and dependent persons to the city, while driving out more productive non-dependent persons to communities where they can receive a more favorable ratio of benefits to taxes paid.

Jointness of consumption exists when one person's consumption of a good or service does not diminish the consumption of that particular good by another person(s). Goods that diminish with their consumption lack jointness of use and possess the trait of subtractability. Most goods and services possess some degree of subtractability: At some level of consumption, one additional person's consumption of a good subtracts from any other person's consumption of that good. The level or threshold at which subtractability increases is defined as congestion and can drastically

^aThis discussion draws upon Ostrom and Ostrom (see Ref.^[14]).

^bJohn Heilburn (see Ref.^[15]).

affect the provision of goods and services. As cities grow, public roadways that bestow equal access to all residents can no longer provide adequate service to all citizens without significantly impairing service levels of other citizens (e.g., traffic delays).

Goods and services can be initially characterized by the two extreme conditions of jointness and exclusion. Goods for which exclusion is feasible and that possess a significant degree of subtractability are defined as private goods (e.g., food, health care, housing) and can be expected to be produced by private markets. The other extreme, where goods are characterized by joint/non-subtractable usage and non-exclusion, defines a collective good (e.g., national defense, pollution control). Between the extremes of private and collective goods are toll goods and common property resources. Toll goods have joint use but feasible means of exclusion. Movie theaters, libraries, cable television, and emergency medical services are common examples of these goods. Private vendors can arrange for the delivery of these goods (e.g., entrance fees to movie theaters), and further regulation (e.g., no drinking or smoking in the theater) can ensure that subtractability does not diminish usage and enjoyment of the good or service for some users. For common pool resources, exclusion is difficult, but consumption by one user will diminish consumption by other users. The issue of service arrangement for common property resources is how to manage and conserve a resource for which private markets are inadequate.^[16] This is achieved by employing institutional arrangements that price access to the common property resource and thus convert the flow or product of the common property resource into a private good (e.g., charging fees for ambulatory and emergency medical services).

Service delivery of each type of good presents a different set of problems for a governmental unit, particularly for municipalities. The externalities produced

by municipal service responsibility for non-excludable goods and services vary with the specific institutional arrangement employed to fulfill this type of service responsibility. Municipal service delivery of non-collective goods and services through collective taxation produces externalities for those individuals (e.g., wealthier citizens) who may significantly under-value the good or service. The key to municipal service arrangement is the proper match between benefits received and costs paid by each individual consumer, particularly for the public provision of private and toll goods. Identifying the location in the service delivery process where inefficiencies occur can help to identify alternative institutional mechanisms for efficient and equitable service arrangements.

For collective goods and services, inefficiencies are likely to arise from the absence of the appropriate scale of production. A solution for this problem requires more than an alternative arrangement for financing service delivery. Production agreements with vendors who can vary the size of their production plant is one alternative means of service production that municipal governments use to remedy the inefficiencies that result from an inadequately sized production plant. The appropriate scale of production varies with the attributes of the good or service.

The Modes of Service Arrangement

Table 1 identifies nine alternative institutional arrangements for the delivery of municipal service responsibilities. The columns identify the components of service delivery. Each row in Table 1 identifies a unique mode of service arrangement, defined by the mix of municipal responsibility for planning, financing, producing, and distributing a specific good or service. Cell entries identify the role of the municipal government in each

Table 1 Alternative institutional arrangements for municipal service delivery

Service mode	Planning	Financing	Producing	Distributing
<i>Traditional</i>				
Direct	+	+	+	+
Contract	+	+	O	O
Joint contract	+	+	+/O	+/O
<i>Regulatory</i>				
Voucher	+	+	O	O
Subsidy	+	+	O	O

Franchise	+/O	O	O	O
Volunteers	+	O	O	O
Self-help	+	O	O	O

Note: + Government has an active role; O government does not have an active role; +/O government has a limited role.

stage of service delivery. This role takes on two basic forms: 1) the government substitutes itself for another vendor and directly produces and distributes the desired good or service or 2) the municipal government alters the relationship between a vendor (private or public) and the consumer. This latter policy mechanism is identified in the policy literature as the regulatory mode and is directed at altering or controlling the behavior of individuals in order to achieve a specific policy outcome. The major distinction between modes of service arrangement is whether the municipal government takes a regulatory or traditional role in arranging for the service. Empirically, the distinction between regulatory and traditional service modes is a function of the scope and content of municipal responsibility for different phases of service delivery. Traditional service modes have the government assuming responsibility for the planning and financing of the service activity. Only responsibility for production is shared with or assigned to another entity. When governments adopt regulatory service modes, they assume only partial responsibility for planning and financing and assign responsibility for production and distribution to other governments or private vendors.

Service Arrangement and Policy Attributes

The 10 alternative modes of service arrangement vary in their suitability for each type of functional activity. The delivery of collective goods is most likely to be dominated by direct municipal arrangement. Their traits of non-exclusion and non-subtractability make the production of collective goods quite problematic for any private vendor. Even contractual arrangements for the production of collective goods are problematic because of the difficulty of unambiguously pricing the good or service. Common property resources are likely candidates for direct municipal service delivery. The subtractability of these goods and services enables governments to convert common property resources into private goods, once exclusion is achieved by the government. This is achieved by appropriating the flow of the common property (e.g., emergency medical services) and setting a price for the sale of the resource. Vouchers, franchises, and some contractual arrangements are common service modes for toll goods. The municipal government awards an exclusive or limited license to a vendor(s) to sell the regulated good to individuals residing in the municipality. This enables those who undervalue the toll good to avoid its consumption and any tax contribution to the municipal delivery of the good.

Private goods are unlikely candidates for a traditional mode of service delivery. The exclusiveness and subtractability of private goods and services make

Table 2 Service responsibility and the direct mode of arrangement by policy type: 1997

	Private	Toll	CPR	Collective
% responsible	50.3	55.8	84.2	83.8
% directly arranged ^a	44.0	64.7	66.3	76.0

^aArranged entirely with the municipality's own employees.

Source: From Ref.^[17].

a non-direct service mode a more efficient and equitable service arrangement. In the case of private and toll goods, there are ample opportunities for consumers to pay individually for the delivery of these goods or services. Moreover, these financing mechanisms (e.g., user fees, vouchers, subsidies) can be finely tuned to a desired or tolerable level of income redistribution. Substituting a collective tax with a subsidy, voucher, franchise, or user fee allows municipal governments to closely match individual preferences for these goods or services with the recipient's willingness and ability to pay for the services.

I expect that municipal governments that choose to provide their citizens private goods (e.g., health, hospital, and welfare services) will choose a non-direct service mode to fulfill this responsibility. A non-direct mode for these redistributive goods and services will significantly curtail the municipality's responsibility for direct financing. This should lessen the non-equivalence produced by a collective tax for the delivery of a good that bestows concentrated and exclusionary benefits. Conversely, a direct mode of service arrangement will be modal for collective service responsibilities, specifically those with significant jointness of consumption and limited opportunities for exclusion.

Empirical Evidence

Elsewhere, I have validated these hypotheses for a sample of U.S. municipal governments in 1982 and 1987.^[1,2] Table 2 reports the pattern of functional responsibility and mode of service arrangement (i.e., direct and non-direct) for a sample (N=1220) municipalities surveyed in 1997.^c Again, the pattern is consistent with previous findings and the hypotheses outlined above. First, municipalities have limited functional responsibility for private and toll goods and services. Functional responsibility is greatest for collective goods and services and common property resources. These findings are consistent with the

^cThese data were collected by the International City Management Association (see Ref.^[17]). The response rate for the survey conducted between the fall of 1997 and spring of 1998 is 32%.

Peterson's expectation and previous research. Cities eschew responsibility for private goods and services.

As expected, however, the modal means of service arrangement for private goods and services is some vendor or vendors other than the municipality. Another governmental unit and/or a variety of private sector for-profit and non-profit agencies are the most frequent source of service provision for municipal government's private service responsibilities.

To test the hypothesis that the scope of municipal functional responsibility for private goods and services increases with a non-direct mode of service provision, I have estimated a model where the dependent variable is the proportion of private goods provided and the independent regressors are the proportion of private functional responsibilities arranged by an entity other than the municipality, the population size of the municipality, and dummy measures for the region in which the municipality is located.^d The estimate for the proportion of private goods and services arranged by non-direct means is statistically significant and positively signed (t-value=7.6, $P < 0.000$). A 1% increase in the proportion of private sector goods and services arranged by non-direct means is associated with a 0.26% increase in the scope of functional responsibility for private goods and services. The positive and significant effect of non-direct modes of service arrangement on the scope of functional responsibility for private goods and services is modest. This finding, however, supports the argument that a municipality's aversion to responsibility for these potentially redistributive goods and services can be mitigated by non-direct provision of these potential troublesome functional responsibilities.

CONCLUSION

The positive relationship between the mode of service arrangement and the scope of functional responsibility, especially for private goods and services has been confirmed since 1982. This raises several interesting questions for further study. What are the political consequences of this relationship for continued public support for the municipal provision of private goods and services? Buchanan, Miller, and Peterson argue that cities that fail to avoid responsibility for redistributive social services suffer both economic distress and political fallout, i.e., defeat of incumbent officeholders. Is the latter true? What are the political consequences of the municipal responsibility of redistributive social services, especially under different modes of service arrangement? There is nearly a quarter century of

municipal experience with alternative modes of service arrangement, specifically for redistributive social services. This time frame offers researchers sufficient opportunities with which to study the political consequences of alternative modes of service arrangements.

Logical Positivism and Public Administration

Laurent Dobuzinkis

Department of Political Science, Simon Fraser University,
Burnaby, British Columbia, Canada

INTRODUCTION

Public administration is both an art and a science. In both senses of the term, it deals with the management of public affairs. But, as a social-scientific discipline, public administration asks, “*why* are public policies formulated and implemented in the way they are?” or “*why* are government agencies operating the way they do?” Practitioners, in contrast, are more concerned with the issue of *how* to run government agencies efficiently, yet in a manner consistent with legal standards and norms of democratic accountability. This distinction must be kept in mind when assessing the influence of positivism on, and its relevance to, public administration.

Positivism offers a certain view of how research outcomes and procedures can be deemed to be scientifically valid. Thus, it appears to be more relevant to the study of public administration than to its practice. But public administration as a practice often relies on scientific and technical expertise. Positivism used to be the authoritative definition of the scientific methods until the mid-twentieth century. Today, however, it has become a contested notion; not surprisingly, therefore, the same debates that have divided or continue to divide other disciplines are replicated in public administration.

THE RISE AND FALL OF LOGICAL POSITIVISM

Logical positivism in a strict sense consists of certain positions adopted by twentieth-century philosophers of science (e.g., Rudolf Carnap and Carl Hempel) in their attempt to establish the best way to define the goals and methods of science. In that sense, it can be contrasted with other schools of thought (e.g., pragmatism and relativism). It refers more specifically to the ideas developed and discussed by a group of influential Austrian philosophers and scientists in the 1920s (i.e., the Vienna Circle). But many of their ideas can be traced back much farther. The British empiricists of the seventeenth and eighteenth century (from John Locke to David Hume) insisted on the primacy of empirical observations over idle speculation and began to articulate the essential principles of the inductive

method.^a In so doing, they laid the groundwork for the future development of logical positivism. Indeed, logical empiricism is sometimes used as a synonym for logical positivism.

The other sources of logical positivism are developments in formal logic, which took place in the late 1800s and early 1900s. These efforts were aimed at clearly demarcating logical relationships from empirical ones to clarify what one is testing when subjecting a scientific theory to the double tests of experimental verification and logical consistency. The stated purpose of logical positivism was to achieve a rigorous synthesis of logic and the experimental method of science.

Logical positivism can be characterized in terms of three basic principles: 1) facts must be collected by impartial observers in an objective manner (the facts-values dichotomy); 2) theoretical hypotheses must be validated experimentally (the verification principle, which, in its most radical form, states that statements that cannot be experimentally validated are meaningless); and 3) the goal of scientific research is to identify law-like regularities that can be used to explain and/or predict both natural and social phenomena (the covering laws principle). Or, to summarize, science is derived from facts and consists of testable hypotheses that can be applied to an ever-widening range of phenomena.^b

Although logical positivism was for some time regarded as the most sophisticated analysis of the scientific method, it was not long before critics began to question the validity of its fundamental principles. Contemporary philosophers and sociologists of science do not agree amongst themselves about what alternative view or views are preferable. But there is a general agreement that pure facts do not exist. Factual observations are almost always colored by prior commitments

^aDavid Hume, however, stressed that generalizations arrived at inductively are never absolutely true.

^bFor a more subtle discussion of the positions defended by the Austrian logical positivists than can be offered here, see Friedman, M. *Reconsidering Logical Positivism*; Cambridge University Press: New York, 1999. On the place of positivism within the social sciences, see Hollis, M. *The Philosophy of Social Science: An Introduction*; Cambridge University Press: New York, 1994; chapter 3.

to certain theoretical views, if not by certain sociological beliefs that scientists share as members of the institutions to which they belong (the importance of the latter is more hotly debated than that of the former). However, recent scientific developments strongly suggest that many phenomena, especially in the domain of the social sciences, are not characterized by stable and universalizable relationships. Such phenomena consist of dynamic, sometimes even chaotic, patterns that are difficult and probably impossible to predict accurately or even explain unequivocally.^c

Positivism is not dead, however. In the philosophy of science, the excesses of postmodern constructivism—the idea that not only are facts colored by theoretical preconceptions, but also that science is merely another way of constructing reality out of the values and beliefs scientists bring to their work—have led the way back, if not to strict positivism, at least to “critical realism.” In the social sciences, quantitative methods of analysis continue to be justified in terms of a more or less positivist epistemology. Indeed, public administration scholars often use analytical instruments (e.g., survey research) that pose little or no challenge to positivist methodology.^[1] These methods are generally regarded as constituting only one of several tools from which researchers can choose. Public administration scholars have learned to appreciate the strengths and weaknesses of various approaches to the study of government and public policy. Eclecticism, however, is not necessarily as commonly found among the many experts in applied sciences and engineering—including experts who hold managerial positions in various government agencies—who continue to adhere to uncompromisingly positivist conceptions of science. Technically trained experts have been known to resist attempts by stakeholders or officials in other agencies to question the validity of their assumptions about the policy issues to which their expertise is relevant.

PUBLIC ADMINISTRATION: POSITIVIST BEGINNINGS

In both Western Europe and North America, public administration as a profession defined by strict standards of technical competence, and an academic discipline, came into existence roughly between the 1870s and the early 1900s. This was precisely the era

when positivism gained ascendancy among scientists and philosophers of science, leading eventually (see above) to the logical positivist synthesis. (Positivist conceptions of law as an instrument of statecraft divorced from morality also emerged at the same time.) During that time, various administrative reforms were implemented to deal with a host of new demands placed on public institutions by rapidly industrializing societies. Modern bureaucracies staffed by competent experts replaced ad hoc administrative structures whose principal function had often been the allocation of patronage appointments. The reigning positivist orthodoxy provided strong justifications for this transfer of control and power to a new class of bureaucratic specialists, even if many of them were not actually trained in the natural sciences but in disciplines such as accounting, law, or economics.

It has become customary to cite Wilson and Max Weber as the authoritative contemporaneous sources on these reforms.^[2] The conventional wisdom is that they defended a strict separation between the domains of politics and administration. Administration became synonymous with objective knowledge and technical expertise, whereas politics was understood in terms of partisan conflicts and subjective values. Administration was all about policy implementation and politics about policy formulation. This is an oversimplification. To begin with, neither of these two scholars can be deemed to have had much influence on the reforms they were describing or even on the crystallization of the politics–administration dichotomy into the dogma of their times. Max Weber’s works were not discovered in translation by American sociologists of administration until the 1940s, and the creation of the administrative state in the Europe of his time owed nothing to his influence. In fact, his role in that respect was more that of a critic than of a reformer. As for Wilson, the politics–administration dichotomy, which he himself became rather critical of later in his life, was not picked up by his contemporaries as having been his major contribution to the field. It is true that the fledgling academic discipline of public administration in the early 1900s often emphasized the conceptual differences between politics and administration, but pioneers such as Frank Goodnow, Leonard D. White, or W.F. Willoughby never insisted on the need to build walls between these two domains.

All the same, it is clear that between the 1880s and the 1920s, the first steps toward the creation of an administrative state were taken, and the study of public administration found its place within political science departments in American universities. (One must also mention the creation of New York City’s Bureau of Municipal Research in 1907.) Positivist beliefs about the capacity of science to produce objective knowledge of both natural and social phenomena strongly

^cThis second criticism does not directly pose a challenge to science itself; chaos theory proposes testable hypotheses about systemic patterns. But it shows that observed facts cannot always be used to make reliable predictions about specific events whose uncertainty is, therefore, irreducible.

influenced these initiatives. It was believed that a more scientific approach to the management of both public and private organization would be a marked improvement over the age of the amateurish entrepreneur or narrowly partisan politicians (as the saying goes, “there is no Republican way to build a road”).

THEORY AND RESEARCH: EXORCIZING THE GHOST OF POSITIVISM

Throughout the second-half of the twentieth century, public administration moved away from positivism. However, depending on whether one considers the academic or practical side of public administration or whether one looks at macrotheoretical developments of microlevel analyses and models, the aptness of that remark varies somewhat.

Since the 1940s, public administration theorist, organization theorists, political scientists, and sociologists have attacked the Weberian bureaucratic model for being exaggeratedly mechanistic and rigid, dehumanizing, and intellectually bankrupt. Some of these attacks are directed at straw men whose actual goals had also been reformist. Nevertheless, the linkage between these critiques and the decline of positivism is indirect but rather obvious. Insofar as these critiques emphasize the interdependence of political values and administrative dilemmas, the importance of horizontal, non-hierarchical communications, the messiness of most policy problems, the contingent and value-laden nature of the information available to decision maker, and the need to empower both street-level civil servants and their clients, among other things, they run counter to the positivist commitment to objectivity, as well as the certainty inherent in technocratic methods of posing and resolving problems. There has been, therefore, a general trend toward a postpositivist, if not truly postmodern, understanding of governance issues.

Although this has been the case at the macrolevel, research agendas at the microlevel have moved in another direction. When Herbert Simon wrote *Administrative behavior* in 1945, he demolished the scientific pretensions of earlier attempts by Luther Gulick and Lyndall Urwick to construct a science of administration. His intention was to fashion more truly scientific analytical tools for the study of decision making within organizations. In typically positivist fashion, he insisted on the need to empirically test whatever statements public administration scholars make about their subject. Simon's recommendation has not always been followed in practice, but remained unchallenged for several decades. To this day, the empirical analysis of decision making, performance, and other aspects of organizational life (e.g., the demographics

of the public service; who believes in what in an agency and to what effect; and levels of job satisfaction) has become increasingly sophisticated, although perhaps not as sophisticated or as common as in other disciplines.^d The way in which these models are designed and tested is consistent not only with logical positivism, but also with its reduction to linear modeling (i.e., proportionality of causes and effects). In recent years, some original attempts at applying the mathematics of non-linear dynamics to administrative behavior have brought to light the unpredictability inherent in the outcomes of even some of the most basic administrative routines,^[3] but these remain rather atypical research projects.

More radical challenges to positivist tenets have come from studies that emphasize the extent to which policy analysts and managers interpret and reinterpret the information they receive from their clients, and communicate to their colleagues or hierarchical supervisors; the same is true of the latter in their relations with the former.^[4]

THE REAL WORLD OF PUBLIC ADMINISTRATION

Many of the new ideas about governance alluded to above have been implemented under the banner of the “new public management” in the United States, Canada, and several other countries around the world. One of the tenets of the new public management is that the traditional bureaucratic emphasis on procedures must give way to an emphasis on outcomes. In some respects, this trend creates a greater need and demand for objective methods of performance measurement and of evaluating the actual impact of government programs on the economy. Computers make it possible to analyze an increasing amount of data on internal managerial issues, as well as on relations with clients, other agencies, and so on. (At this level, there might be an opportunity for greater congruence between empirically oriented public administration scholars and practitioners who, as a rule, were not always particularly interested in the quantitative side of public administration research.)

However, the tendency to encourage innovation, flexibility, and responsiveness point in the direction of a more intuitive management style. Coupled with political and societal trends, such as deregulation, the

^dSeveral authors have lamented the relative lack of statistical sophistication that characterize much public administration research in comparison to sister disciplines such as political science; see, for example, Gill, J.; Kenneth, J.M. Public administration research and practice: a methodological manifesto. *J. Public Admin. Res. Theory* 2000, 10 (1), 157–199.

increasingly pluralistic character of civil society, and the deepening chiasm between the world views of various policy communities (e.g., environmentalists vs. energy producers and regulators), the shift toward the new public management poses an increasingly severe threat to the ideal of objective knowledge as a foundation for administrative expertise. Agencies whose organizational culture rests on that notion (e.g., the U.S. Forest Service) are more likely to find such changes in their political and social environment disturbing. This background accounts in large measure for the growing interest in non- or anti-positivist approaches.^[5,6] It would be a mistake, however, to conclude that these approaches have become dominant.

CONCLUSION

While Charles Lindblom did not have the field of public administration itself in mind when he coined the phrase “muddling through”—he was referring to what policy makers do—it seems an apt description of how public administration deals with methodological issues. Public

administration scholars and practitioners continue to be divided among themselves but perhaps even also within themselves about the merits and weaknesses of positivist methods.

Logistics and Transportation

Linda L. Stanley

School of Business, Our Lady of the Lake University, San Antonio, Texas, U.S.A.

Darin Matthews

Multnomah County Schools, Portland, Oregon, U.S.A.

INTRODUCTION

The management of transportation services is frequently an overlooked opportunity to contribute to the success of governmental operations that depend on purchasing's ability to evaluate transportation options and carriers, determine the means to reduce transportation and inventory carrying costs, expedite and trace shipments, and process claims. The selection of a transportation system is a specialized form of procurement in which services are purchased to provide a link among manufacturing sites, warehouses, distribution centers, and/or office sites. Components of the transportation service buy include 1) evaluating the prices of various transportation methods, 2) determining the effect of transportation service on operations, and 3) evaluating the effect of transit times, carrier dependability, and safe delivery on inventory levels.^[1]

Traditionally, the procurement and management of transportation services were relegated to the supplier who provided a "laid-down price"—the cost of transportation rolled into the price of purchased goods. This manner of operation was particularly popular prior through the late 1970s because rates were regulated by federal and state governments and were not negotiable. However, since deregulation, flexible pricing plans and more service options are available. Carriers are now logistics service companies and have integrated their expertise with that of their customers.^[2] Thus savings opportunities are possible by paying closer attention to the costs of transportation, whether directly arranged by the procurement officer or managed by a supplier. Second, businesses and government agencies have begun to realize the value of evaluating the *total cost* of procuring goods, which may include transportation costs, carrying costs, disposal costs, etc.

This article is designed to provide governmental purchasers an introduction to transportation management, to offer strategies to effectively manage the procurement of these services, and to suggest some future trends. We will start with some definitions common to the transportation industry.

DEFINITIONS

Transportation is "the physical movement of goods and people between points."^[3] Goods may include new materials brought into a production process or finished goods shipped to the customer. *Carriers* are those organizations that provide transportation services, and the primary *modes* include railroads, motor carriers, airlines, water carriers, and pipelines. Procurement officers may also hire *third parties*, or intermediaries, who serve to connect the various modes of transportation. Some examples include *transportation brokers*, *freight forwarders*, and *shippers associations*.

Transportation is part of both the inbound and outbound movement of goods. The inbound side is often referred to as *materials management*, which combines the activities of procurement, warehousing, transportation, inventory management, quality control, and scrap/disposal with the goal of improved customer service.^[4,5] *Physical distribution* focuses on the outbound side, dealing with the flow of the finished goods to the final customer.^[4] There may be several channel members in physical distribution of goods, including wholesalers and distributors.

Logistics management or *integrated logistics* management combines both inbound and outbound sides and can be defined as "the art and science of obtaining and distributing materials and products."^[6] Factors that contributed to the move toward an integrated logistics function and beyond are provided in the next section.

EVOLUTION OF LOGISTICS

The term *logistics* was derived from military activities related to the deployment and the support of armed forces during the times of war.^[7] In fact, logistics was referred to as early as 500 BC in Sun Tzu's *The Art of War*,^[8] a book about logistical activities and their relationship to war tactics and strategies. During World War II, logistical activities contributed to victory for the United States and its allies. More recently, logistical activities were identified as a critical

component of success for the United States during the Gulf War in 1990–1991. Involved was a massive movement of 122 million meals, 1.3 billion gal of fuel, and 31,800 t of mail.^[9] Since the 1960s, logistics has come to the forefront of best business practices.

During the 1960s and 1970s, the impact of global competition on U.S. firms was significant. Companies were losing market share and revenues to firms from other countries, particularly Japan and Germany. Competitive pressures increased in the mid-1970s as trade barriers were reduced, forcing U.S. firms to improve the quality of their products and services, to focus on higher levels of customer service and satisfaction, and to reduce costs. The amount spent on logistics was identified as the final frontier for cost reduction and improved customer service.^[10] Businesses turned their attention to the physical distribution of goods and materials for improved customer service and cost savings. They moved toward logistics management, the integration of transportation, distribution, warehousing, finished goods, inventory management, packaging, and materials handling. Deregulation of transportation played a large part as increased competition among carriers resulted in lower transportation rates and better management of inbound transportation.

Beginning in the late 1970s and continuing into the 1980s, the physical distribution management expanded to logistics management. This move led to purchasing's increased involvement in logistical decisions, including transportation management. Factors influencing this move included changes in the manufacturing environment and an increased emphasis on quality.^[11] The environment had changed as manufacturers moved to outsourcing a greater percentage of the content of their products to outside suppliers. These suppliers were able to produce parts at a lower cost in part because of their non-union environment. To replace the benefits of controlling all-part production, many firms moved to a just-in-time (JIT) manufacturing environment. In essence, JIT involved suppliers delivering parts to manufacturing sites just as needed for production and producing goods based on the actual customer need, rather than forecasts, resulting in lower inventory-carrying costs. However, it also meant relationships with both suppliers and transportation carriers needed to be stronger to assure the delivery within tight windows. In many instances, companies moved to single-sourcing arrangements. At the same time, the total quality management movement was in full force, enabling firms to compete with foreign goods producers. The selection of quality carriers was an important part of the equation because manufacturers had to be assured that the goods were moved safely and the customers were provided a proper level of service. Once the firms reduced the number of carriers in the pool, they focused on developing

measures of performance and monitoring carriers more closely. These measures included percentage of on-time shipments, percentage of damaged shipments, and percentage of complete orders shipped.

During the late 1980s and 1990s, the term *supply chain management* emerged and was defined as managing the total flow of goods and information from supplying agency to final “customer,” realizing that each step in the flow of goods should add a value.^[12] Potential savings within a supply chain were the driving factor behind this new trend. A supply chain has a series of “fixed points”—warehouses, distribution centers, offices, where goods are stored—linked together by transportation. This strategy includes developing partnerships between manufacturers, suppliers, and logistics-related members of the supply chain including transportation carriers. In particular, shippers spend more time qualifying their carriers. Carrier strategies that will lead to more successful relationships within the supply chain have been cited:^[13]

1. Partnerships in which both shipper and carrier challenge each other to provide innovative solutions.
2. Working jointly with shippers to control transportation costs.
3. Providing services considered the highest priority by the shipper.
4. Committing to continuous improvement processes that are critical to positive change.
5. Implementing satellite communication systems.
6. Providing information systems, logistics consulting, and specialized services based on customer needs.

TRANSPORTATION STATISTICS

Logistics costs as a percent of gross domestic product (GDP) have continued to drop with the advent of deregulation. At a high of 17.9% in the early 1980s, costs have averaged approximately 10% since 1992 and were 10.1% in 2000.^[14] In 2000, 5.9% of GDP was accounted for by freight transportation costs, the largest component of logistics costs, or \$590 billion in 2000. The most recent figures available indicate that federal, state, and local governments spend approximately \$129 billion annually on transportation.^[15]

Table 1 breaks down where organizations spend their logistics dollars.

CARRIER SELECTION

Selecting a transportation carrier can be one of the most crucial decisions a government purchaser can

Table 1 Logistics cost breakdown, 2000

Logistics cost	Cost (\$ Billion)
Carrying Costs	
Interest	\$95
Taxes, Insurance, Obsolescence, Depreciation	204
Warehousing	78
Subtotal	\$377
Transportation Costs

Logistics Administration	39
Subtotal	\$44
Total Logistics Costs	\$1,006

(From Ref.^[14].)

make for their organization. Just as choosing the right supplier of goods can help ensure the operational success, determining how those same goods are transported to their final destination is vital.^[16] While the initial choice made by an agency will be the type, or mode, of delivery, the choice of carriers will certainly be next.

When one contemplates how important quality deliveries are to an organization, they need only to look at the seven R's of customer satisfaction:^[17]

1. The right product.
2. Delivered to the right place.
3. At the right time.
4. In the right condition and packaging.
5. In the right quantity.
6. At the right cost.
7. To the right customer.

The importance of quality, accuracy, and timeliness in the delivery of goods is apparent. Logically, this places major importance on which carrier the purchasing practitioner selects to make such deliveries. With the importance of the carrier selection determined, let us examine how these decisions are best approached.

One of the first considerations a buyer must make in carrier selection is whether or not these services will be purchased separately. The predominant method in

the public sector is to shift the burden of carrier selection to the supplier.^[1] By specifying Free on Board (FOB) Destination in the bidding documents, the public agencies have charged the selected vendor with handling all the aspects of delivery, with the agency taking ownership upon delivery.

However, there are many instances where an agency can contract directly for transportation services. Many organizations ship out goods and equipment from their own facilities and hire private carriers to transport them. For instance, a water treatment facility may need to ship specialized control equipment to a manufacturer for repair or upgrade. To ensure quality transportation services of such critical equipment, they would likely have a contract with a carrier already in place. Even for incoming freight, this approach can make a lot of sense. Rather than rely on a carrier someone else has selected, a public agency may want to hire a carrier to transport that replacement compressor from the supplier's dock. By doing so, buyers are essentially stating that they are better equipped to determine the carrier than their supplier.

If the government purchaser does elect to contract for transportation services, they will face many of the same issues encountered with other types of services. A determination of the best procurement method will need to be made. An invitation to bid may be employed or possibly a request for proposal (RFP). A bid process will be driven by the lowest cost, while the RFP process will take into account the other aspects the agency determines as valuable. These can include service quality, corporate experience, financial stability, customer satisfaction, and prior dealings among other factors. According to the research by McGinnis,^[18] *service* is often more important than *cost* when selecting carriers.

As with other procurements, the opportunity for a contractor to have a large volume of guaranteed business by the agency will normally result in very favorable offers from the carrier community. Additionally, long-term agreements with multiyear options can provide an opportunity for a carrier to become a strategic partner of the public agency. Once a contract is executed and the business relationship is established, the agency has the ability to utilize the carrier whenever a transportation need arises. Similar arrangements can also be made with the third-party providers of transportation services. When an organization contracts with a freight forwarder or a broker, they can provide whatever type of transportation mode is needed, offering the buyer even more flexibility.

MODES OF TRANSPORTATION

There are five primary modes of transportation—motor carriage, rail, air, water, and pipeline. Each

mode provides its own unique capabilities as well as disadvantages. The following paragraphs provide a short analysis of each mode.

The dominant mode of transportation is motor carriage, or trucking, where approximately \$481 billion was spent in the United States in 2000 (Table 1), and they moved approximately one-half of all tonnage. The industry consists of a large number of small carriers, resulting in a high level of competition. The reasons for the heavy use of trucking include high availability, ability to provide service from and to almost any location, relatively fast transit times, and reliable service. Motor carriage has two roughly equal segments, for-hire and private carriage. Ninety-five percent of all for-hire carriage is moved by truckload, with the remaining 5% by less-than-truckload, or movements of less than 10,000 lb.^[19] The average truckload delivery spans 350 mi, with a market dominance of up to 750 mi. Trucks move raw materials, component parts, and finished goods. Trucking companies are actually a good customer of the rail industry, loading their trailers onto rail flatcars.

There are a small number of relatively large railroads, called Class I carriers, in the United States. As seen in Table 1, the railroads account for about 6% of the revenues generated by all modes, although they move approximately 25% of all the freight tonnage.^[20] Railroads carry primarily commodities including grain, metallic ores, crushed stone, and glass and clay products. Their advantage lies in moving goods long distances in large volumes with a low-cost structure. However, access is a significant disadvantage, resulting in the need for an additional mode of transportation such as trucks to complete deliveries. Another disadvantage is the long transit time as a result of consolidation and the transfer of boxcars at classification yards within the rail system. Shippers must also pay additional costs to maintain the safety of their goods. However, rail service is more reliable than other modes because it is mostly unaffected by poor weather conditions.

Water transportation also plays a significant role, accounting for \$26 billion of total logistics dollars spent within the United States (Table 1). This mode is frequently used by the organizations located in strategic areas to move raw materials, heavy items, and low-value bulk materials. Road salt is one example of a common government commodity often transported by water. The oldest technology of transport, water transportation includes barges used on inland waterways as well as ocean-going ships. The cost of the pickup and the delivery of goods to the dockside need to be included in the total cost of shipping, as they are not included in the water freight rates. Water carriers normally base their charges on either weight or

volume, depending on which one results in the highest revenue for the carrier.^[1] The federal government has long been involved with improving the waterways within the United States. The Army Corps of Engineers is the agency that provides oversight and funding for river and harbor improvements. Projects such as enlarging the locks and deepening the channels are examples of such improvements.^[3]

In 2000, a total of \$27 billion was spent on international and domestic airfreight. This transportation mode includes all shipments made by air cargo carriers. The movement of goods through the air has certainly increased in recent years, but the relatively high cost has kept its use somewhat limited in the government. As a general rule of thumb, the freight rates for air cargo are approximately twice as high as motor freight. However, along with the higher costs do come certain advantages. Because the air travel is generally much smoother than the ground freight, it is very attractive for transporting delicate equipment.^[1] Another advantage is the shorter delivery times involved with the air transport. A specialized repair part, for instance, can be shipped from New York to California in 1 day. Commercial companies that provide such service include the Federal Express and the United Parcel Service. When typical ground transportation would take several days, the decision to use airfreight is much more attractive. With such short lead times, organizations can normally reduce their inventories and carrying costs.

Referred to as the “hidden giant of American transportation,” pipelines have been around since 1865 when Samuel Van Syckel constructed a 5-mi oil pipeline in Pennsylvania.^[3] Besides its extensive use in the oil industry, pipelines are also used to transport other materials such as natural gas and coal slurry. The total transportation costs for oil pipelines alone was \$9 billion during 2000. Within the United States, there are over 110 regulated oil pipelines. From 1906 to 1977, the oil pipeline industry was governed by the ICC. Since then, it has been regulated by the Federal Energy Regulatory Commission. The dependability of this transportation mode is extremely high, as far as obtaining the product to its destination when promised. Because pipelines are virtually unaffected by the weather, they really are unparalleled when it comes to dependability. One disadvantage to the pipeline transportation is the high costs associated with installing and maintaining the piping systems. The material, labor, and equipment costs can be extensive, including such things as speciality piping, journey level labor, pumps, and computerized flow controls. However, the pipelines continue to be a viable means of transportation in the United States, particularly in the oil industry.

CONCLUSION

Transportation has played an important role in the development of the United States and thus our economy. City locations and their growth were often influenced by access to transportation. For example, Boston initially grew because of its origin as a port city; Chicago was a hub for the railroads; and Atlanta, initially a railroad stop, now has the world's largest airport.

Today, significant changes are occurring within the industry itself. A formerly heavily regulated industry now has the freedom to set prices, to determine where they want to operate and where they want to discontinue service, and to negotiate special services for customers. Cavinato^[21] suggests watching for certain trends in the next 10 years, including:

1. Continuing turnover of truckload motor carriers.
2. More rail mergers with few capacity changes.
3. Consolidation of courier and express mail firms.
4. Airline volatility, including bankruptcies and mergers.
5. More extensive use of electronic information to provide inventory visibility and efficient billing and payment.
6. Industry consolidation that allows more one-stop shopping.

Wood and Johnson^[3] also foresee an increase of environmental protection and safety laws. Additionally, recycling's impact on transportation will be significant because packaging choices will be based on reuse. Recycled materials and products mean additional hauls for transportation carriers. Finally, threats of terrorism will have a major impact on the international trade and the transportation carriers. The new challenge will be to reduce time and costs given increased security measures taken by the U.S. government. Given these trends, transportation and logistics will continue to be a dynamic and challenging part of the public procurement process.

INTRODUCTION

With an area of nearly 330,000 km² and a population of 23 million, Malaysia is located at the heart of Southeast Asia. It is essentially a plural society where over 50% of the population are Malays and the rest are Chinese, Indians, and indigenous people. Politically, Malaysia is one of the most stable countries of the region. Yet despite the presence of multiparty democracy, Malaysia is often branded as a “semi-democracy”^[1–3] and its political system as “hegemonic.” A single party—the United Malays National Organization—has been dominating the political scene since independence in 1957. Economically, Malaysia has made impressive gains over the past decades; the economy is largely export-led, and it continues to enjoy high levels of growth notwithstanding the setbacks of the recent Asian financial crisis. With a human development index (HDI) ranking of 59 in 2002, Malaysia also fares well internationally in terms of other socioeconomic indicators. The economic success of the country is attributed, among other things, to political stability, dynamic and visionary leadership, and the efficiency of the administrative system in planning and managing programs of socioeconomic development.

THE GOVERNMENTAL SYSTEM

Malaysia is a constitutional monarchy within a federal and parliamentary structure. Of the 13 federating states, Selangor, Johor, Perak, Perlis, Pahang, Kedah, Terengganu, Kelantan, and Negri Sembilan are headed by hereditary *Sultans* who elect one of them as *Yang Di Pertuan Agung* (*Agung*), the supreme but nominal head of the federation for 5 years. The remaining states—Malacca, Penang, Sabah, and Sarawak—are headed by state governors appointed by the *Agung*. The Malaysian parliament consists of two chambers: a 219 member universally elected *Dewan Rakyat* (the lower house) with exclusive control over legislation and finance and a 69-member nominated *Dewan*

Negara (upper house) performing the tasks of scrutiny and review.

The federal government, with overarching control over the entire country, is responsible for key public tasks such as finance, foreign affairs, defense, internal security, trade, commerce and industry, health, education, and social welfare, whereas the state governments have jurisdiction over local government, agriculture, land, mines, forestry, Islamic matters, and Malay customs. Although the federating states share certain functions^a with the center, the balance of power is tilted heavily toward the federal government.

The Administrative Structure

The federal government is organized into ministries, departments, and statutory bodies. Currently, there are 25 ministries, 161 departments, and 75 statutory bodies through which the business of the federal government is transacted. Each ministry, headed by a minister, plays an important role in planning, coordinating, and implementing government policies and programs and has under its control a number of departments and statutory bodies which are primarily the implementing arms of the government. The secretary general, a career civil servant, as the administrative head of a ministry, assists and advises the minister and is responsible for the proper implementation of all policies and directives pertaining to the ministry. The departments are headed by directors-general and usually have their offices at the state and district levels.^[4,5]

The prime minister and his cabinet, responsible to the *Dewan Rakyat*, exercise executive authority. At the apex, the prime minister's department serves as the nerve center of government administration and is vested with considerable powers to coordinate government policymaking and implementation. Its chief

^aTwo eastern states of Sabah and Sarawak have been granted some additional powers relating to immigration and education.

secretary, the highest-ranking civil servant and principal advisor to the prime minister, is responsible for smooth and efficient implementation of the decisions of the cabinet. The other key central agencies include the Treasury within the Ministry of Finance, Public Service Department (PSD), Economic Planning Unit (EPU), Implementation and Coordination Unit, and Malaysian Administrative Modernization and Manpower Planning Unit, all under the prime minister's department.

At the state level, the governmental machinery replicates a similar fashion. The state executive council—the highest executive authority at this level—is headed by a *Menteri Besar* in states with hereditary *sultans* and a Chief Minister in other states. Although appointed by the federal government, he is required to contest and win in the state legislative assembly elections. The state secretariat is administered by the state secretary (the head of the civil service at the state level) who also acts as the chief advisor to the *Menteri Besar*/Chief Minister. Administratively, each state is divided into districts, *mukims* (subdistricts), and *kampungs* (villages). Although there are some additional levels in Sabah and Sarawak, districts play important roles throughout the country as most federal departments and agencies have their branches there, and almost all development projects planned at federal and state levels are implemented at this level.

The civil service in Malaysia has two broad divisions: the federal civil service and the state civil service. Although the federal civil service is organized into various cadres, the elite Malaysian Administrative and Diplomatic Service [*Perkhidmatan Tadbir dan Diplomati* (PTD)] is the most important. Officers belonging to PTD enjoy more power and prestige, occupying as they do most top policymaking positions at both federal and state levels.^[6] The civil service is also divided into three broad categories: top management group, professional and managerial group, and support staff. These groups are arranged vertically into 274 service schemes under 19 classifications based on similarities of roles and functions. Generally speaking, the service structure is rigid both vertically and horizontally^[5] with little or no scope for interservice or group mobility. This, apart from huge differentials between/among various categories in terms of pay and perks, has caused considerable tension and resentment in the civil service. Although some states have their own civil services, almost all senior positions at the state level are filled by PTD personnel and other centrally appointed bureaucrats.

The PSD serves as the central personnel agency, with jurisdiction on personnel matters of federal, state, and local governments, but an independent Public Service Commission has responsibility over recruitment and selection in the civil services. There are

another four specialized commissions for judicial and legal matters, railways, police, and education services. Civil servants in Malaysia are selected on the basis of merit and quota principles through a series of interviews, written examinations, and medical tests and placed on probation for 3 years before being confirmed and considered eligible for stipulated benefits and privileges.^[5]

REFORM AND MODERNIZATION EFFORTS

Since the early 1980s, the administrative system, in general, and the civil service system, in particular, have undergone significant changes. A series of reforms aimed at enhancing efficiency and effectiveness have been introduced. These have modified the structure of the public service, rules, regulations and procedures, personnel management, planning, budgeting, and financial management systems. The worldwide recession of the 1980s and the growing budget deficits caused by falling exports and public revenues prompted the government to reduce its involvement in the economy and hence “downsize” the public sector. Following global trends in public management reforms, Malaysia has undertaken major programs of privatization and deregulation. Such drives along with subsequent institutional restructuring have led to considerable reductions in the size of the public bureaucracy; yet it remains relatively large vis-à-vis the population it serves.

Early initiatives such as the introduction of time clock systems, name tags for employees, codes of ethics, manuals on office procedures, and quality control signaled the government's commitment to bureaucratic efficiency and responsiveness and clean and trustworthy government. Other moves sought to enhance civil service capacity and its relationship with the private sector and creation of clearance centers for providing swift and hassle-free services to potential investors seeking business approvals. Public service networks provide a range of services besides acting as one-stop bill payment centers. The Client's Charter, introduced in 1993 along the lines of the Citizen's Charter in the United Kingdom, pursues enhanced bureaucratic accountability and improved service delivery systems. The charter is an assurance by agencies that their outputs and services will comply with stipulated quality standards that conform to customer expectations. More recently, internationally recognized total quality management, ISO 9000 series, and benchmarking have been adopted in the public sector, and a comprehensive award system for quality and excellence has been introduced. The multimedia super corridor was established to promote the application of information communication technology (ICT) in society and implement a variety of schemes such as e-government and e-services

to enhance also the quality of public services. Although there is a gap between promise and performance, generally, reforms are seen favorably; they have helped improve the delivery of public services, thereby contributing to customer satisfaction.^[7]

PUBLIC ADMINISTRATION: TRENDS AND LIMITATIONS

The Malaysian administrative system has performed reasonably well compared with similar systems and traditions elsewhere in the region (except Singapore) and in other developing nations. Certain trends and limitations are perceptible, and these are explained below.

Centralization

Despite the arrangements for power sharing between the states and the center, the governmental system remains highly centralized. First, with exclusive control over all-important matters, the federal government plays a much bigger role than the state authorities. In the event of a conflict between the center and the states, federal laws have precedence. With its monopoly over resources and personnel, the central government exerts considerable influence on the states. Even with some autonomy in certain matters, the states rely on centrally deputed civil servants and federal grants and lack any degree of control on central agencies operating at the state or local level. Second, bureaucratic culture is characterized by a top-down approach to decision making, and there has been little or no attempt at delegating authority at lower levels. This has been reinforced by the concentration of power in central agencies. Prime minister's department symbolizes the concentration of extensive policy and managerial authority for planning and implementation of development activities at the state and local levels. The EPU serves as the center of national planning—conceiving and formulating major economic policies and strategies, including the 5-year plans. Even programs and projects initiated by individual agencies and departments need EPU approval and funding. Under such an arrangement, lower level agencies simply implement policies.

Dominant Executive

External control on administration has been weak in Malaysia mainly because of one-party hegemonic rule^[3] and a series of constitutional amendments it has made over the years increasing the power of the executive in relation to the other branches of the government.^[8] The dominance of the executive

increased dramatically since the launch of the New Economic Policy (NEP) in the early 1970s. The NEP was a two-pronged scheme that sought to correct the problems of economic imbalance among major ethnic groups through redistribution of wealth and assets in favor of *bumiputeras*. Hence a large number of quasi-public enterprises were created under the scheme giving the public bureaucracy an important role in economic planning, public policy initiatives, and the management of large sectors of the economy. Consequently, Malaysia produced one of the largest public bureaucracies among countries of comparable size and level of economic development. Notwithstanding the drives for privatization and deregulation, the bureaucracy continues to play an active role in terms of setting developmental goals, stimulating economic growth through the promotion of private sector, and distribution of incomes and wealth among various ethnic groups. Given its pervasive role in the society, Malaysia is often described as an “administrative state”^[9] where bureaucrats enjoy “positions and powers not to be found anywhere in the democratic world.”^[6]

Elitism and the Rule of Generalists

Public bureaucracy in Malaysia is characterized by elitism, a legacy of colonial administration. Members of the English-educated Malay aristocracy created by the British have continued to fill the highest positions in the bureaucracy since independence and enjoy extensive powers, privileges, and prestige.^[6] They monopolize federal and state administrative structures. The elite PTD constituents occupy important decision-making positions in the field as well and are also privileged to provide leadership in the public service as the directors-general of various ministries and departments invariably come from its ranks. The continuation of the quota system guaranteeing 80% of positions to the *bumiputeras* endows native Malays the opportunity to dominate the ranks of the elite service. This Malay prominence in the PTD has created a feeling of disenchantment among members of other services, further heightening the longstanding tensions in the civil service.^[5]

Politicization of Bureaucracy

An important feature of the public bureaucracy in contemporary Malaysia is the intimate relationship between politicians and bureaucrats. In theory, the Malaysian bureaucracy is governed by professional values and norms, and its members subscribe to the principle of “political neutrality;” in practice, the bureaucracy has never been separated from

politics.^[2,10] Although it is true that political leaders are generally capable of controlling the bureaucrats under their jurisdictions, senior bureaucrats share the same social and economic background with political leaders and play an important role in the policy process. Consequently, civil servants not only see themselves as the “paternal ruling group,” but also often get enmeshed in party politics which, in reality, makes the Malaysian civil service a “political bureaucracy.”^[11,12] Although Malaysian public servants no longer stand for party positions, the law that prohibits them from being involved in party politics is not uniformly enforced. In recent times, the government has been prompt at taking disciplinary action against those public servants who have apparently supported the opposition, but has been wittingly indifferent to those who actively back the ruling coalition. Such a policy has encouraged many civil servants, especially those who wish to build career in politics, to become passive members of the ruling party/coalition and support its policies and programs. Whereas bureaucrats, in general, are expected to be sympathetic to government policies and programs, those who work in the state-controlled electronic media or the Ministry of Rural Development and the National Civics Bureau have little choice but to virtually act as the agents of the ruling coalition.^[10]

Lack of Local Democracy and People's Participation

Local government in Malaysia is yet to emerge as a vibrant democratic institution. Presently, local agencies, established and regulated by state governments, are no more than subordinate offices of the state government. They suffer from limited capacity and resources and depend on federal and state grants to close their fiscal deficits. Furthermore, with local government elections remaining suspended since 1969, popular influence on local government and pressures for responsiveness is rather limited. In spite of administrative modernization, no significant drive has been mounted either to democratize governance at the grassroots or to rejuvenate local government bodies. Repeated overtures of the political opposition and civil society to reinstate a representative local government system have remained unheeded.

Likewise, public participation in governance has been lacking. Whereas impressive gains in eradicating poverty and promoting rapid socioeconomic development have been made, there has been no corresponding progress in creating opportunities for public participation. Reforms have fallen short of widening the presence of politically organized groups and civil society organizations in the policy process. As a result, the policy process continues to be insulated from political

pressures and influences from outside the public sector. Instead, the use of restrictive laws to curtail political participation and the absence of transparency and scrutiny of governmental affairs by a free media have not only undermined Malaysia's democratic image,^[1] but also thwarted the capacity of her citizenry to effectively influence public affairs. Without such capacities, the public at large remains simply passive recipients of government-directed services and facilities.

Corruption

The accountability system, despite changes brought about in various aspects of public management, has remained rather weak and inadequate.^[13] The incidence of bureaucratic malfeasance and corruption thus remains high. Corruption is believed to be rampant particularly at lower levels in the police service, road-transport department, immigration office, customs and excise office, and local government.^[14] Contracts are often awarded on the basis of political and kinship ties and kickbacks, and underhand financial dealings are common business approvals. The Malaysian experience with privatization shows the scale and magnitude of such corruption and patronage distribution.^[15] The anticorruption drives mounted by the government and the institutional mechanisms available to tackle the problem are yet to make any breakthrough in containing bureaucratic turpitude, and so Malaysia's position in the Transparency International's global corruption perception index has remained static over the past few years.

CONCLUSION

Public administration and the policy process in Malaysia operate within a federated pluralist political system with a dominant party playing the key role in all stages of the policy cycle. The prime minister and his cabinet determine policy agenda, make the major decisions to frame and adopt policies, negotiate legislation in parliament, and oversee their implementation and evaluate their impact. An elite band of bureaucrats, selected by a merit-based recruitment system possessing considerable power and prestige and strategically placed in key central agencies, provides support to the political executive in managing governance at the center. The state and local bureaucracies are also active in implementing development programs in their own jurisdictions.

A politically committed political leadership has succeeded in introducing innovations, akin to the advanced industrialized countries, in public management practices. New institutions and structures have been created, and existing ones have been rejuvenated to inject efficiency

in the delivery of public services. A range of reforms centered on economic rationalism as well as citizens' needs has enhanced the effectiveness of the administrative system. Deregulation and privatization have reconstructed the public sector for sound operation, and the application of ICT has simplified and improved communication both within government and between it and the private sector and citizens. Yet despite many positive features of these reforms, the administrative environment in Malaysia remains captive in enduring centralization, bureaucratic elitism, ineffective local governance, subdued public participation, bureaucratic corruption, and ineffective public accountability. These will need to be recalibrated, even if to a certain degree, to give the Malaysian administrative system a character correlating to the maxims of democratic governance.

Management for Quality in Government

Michael E. Milakovich

Department of Political Science, University of Miami, Coral Gables, Florida, U.S.A.

INTRODUCTION

This article traces federal, state, and local government efforts to apply quality management theories and techniques since the reinvention era of the early 1990s. The principles and theories underlying quality management are a mix of various American and Japanese philosophies and strategies that are now widely practiced in many “reinvented” U.S. governmental agencies. Quality management was first applied in U.S. private industry during the 1980s, and is variously referred to as business process reengineering (BPR), companywide quality control (CWQC), total quality control (TQC), total quality management (TQM), and statistical process control (SPC). Most of these theories were based on applied knowledge of systems, empowerment of teams of employees, statistical process control of variation, and changes in organizational behavior.^[1–5] In some cases, the lack of complementary models for the public service sector led to overoptimistic expectations, experimentation, and disappointments. Despite uneven successes, a great deal has changed from a decade ago when there were few models to follow and serious questions about how committed governments were to quality management improvement.^[6] Improving the efficiency, quality, and productivity of government programs has taken on increasing urgency within a political framework of assigning accountability for results, reducing deficits, and streamlining federal executive agencies.

The application of TQM tools and techniques by federal, state, and local agencies responds to citizen demands for better service quality, improves government’s ability and reputation for effectively managing public problems, and provides a promising model for future “customer-responsive” public management practices. Specific projects and strategies to implement TQM and productivity improvement reflect our federal system of decentralized and divided authority, and differ substantially from county to county. Numerous state and local projects have been identified and recognized through formal competitions for quality awards (for examples, see the Malcolm Baldrige National Quality Award web site at <http://www.nist.gov>). They now provide a database of detailed guidelines and “best practices” for others to follow. The federal

government has implemented TQM, with nearly all agencies participating; state initiatives date from the early 1990s, with over two-thirds now involved; and about one-half the local governments (cities over 25,000) report customer service, quality improvement, or employee empowerment in at least one function. Many governments are taking customer service and quality management seriously by adopting a *process approach* to improve common areas, such as personnel administration, record keeping, vehicle maintenance, and community development.

WHAT IS TQM?

The importance of controlling the quality of industrial products was first recognized in the 1920s, when Walter Shewhart introduced SPC charts to monitor outputs in mass production manufacturing.^[7] At the Western Electric “Bell Labs” factory in Chicago during the 1930s, SPC techniques were expanded by Shewhart and his colleagues, including a young PhD in statistics from Yale, W. Edwards Deming. The techniques of SPC provided an efficient method for controlling the quality of mass-produced goods. They were expanded, perfected, and successfully applied to the mass production of weapons and war materials during World War II. In the boom years following the war, the lessons learned were largely forgotten. In the absence of economic competition, American industry leaders mistakenly believed that their products and management systems were superior. The theoretical work of several world leaders in the field of quality improvement paved the way for service professionals to apply these principles to their organizations.

In the early 1950s, Armand V. Feigenbaum^[8] coined the term TQC, and both W. Edwards Deming^[1,2] and Joseph M. Juran,^[4] among others, were invited by General Douglas MacArthur to teach SPC techniques to the Japanese during the occupation. Deming and Juran both met and influenced Kaoru Ishikawa,^[3] who became Japan’s foremost expert in CWQC. Phillip Crosby^[9] alerted the public to the importance of quality at a time when few skeptical American managers listened. Although greater numbers of private

manufacturing firms first succeeded in applying TQC in Japan, several Americans are internationally recognized as the intellectual founders of the concept later labeled TQM in the United States.

Total quality management is a continuous, cross-functional, interdisciplinary, and horizontally integrated management strategy applicable to all types of organizations. It is not an end in itself, but rather a *carefully designed and executed strategy for improving processes, products, and services through continual improvements in quality, reliability, systems, and performance*. Successful applications require an organizationwide commitment to rethinking existing production and delivery systems, not only from an *internal* systems view, but also from the perspective of *external* customers or users. When correctly applied, TQM is also a powerful, yet simple, method of process improvement for achieving valid customer quality requirements and productivity goals without the long-term need for substantial additional resources. It streamlines internal processes and merges process measurement characteristics (voice of the process) with customer satisfaction (voice of the customer) data. In the short-term, additional resources may be required for retraining, but when organizational changes and simple statistical management techniques are combined, TQM reduces internal competition, fosters teamwork, improves decision-making processes, reduces mistakes, and lowers operational costs.^[10]

Total quality management is a participatory organizational change strategy based on the idea that the greater the involvement an employee (or teams of “empowered” employees) has in determining and implementing organizational goals, the more committed those employees will be to achieving them. It encourages better monitoring of results by providing incentives for employees to increase the success of the whole enterprise, rather than offering rewards to individuals as performance incentives. In other sectors of the American economy, reliance on individual performance measures over total system and process improvement approaches has been linked to declines in both employee productivity and service quality. These approaches were discarded and replaced with newer, theory-driven, customer-focused strategies that achieve results without the need for additional long-term resources by changing management systems, enhancing the capacity for individual agencywide cooperation, and continuously improving processes.^[11] Efforts to improve quality and productivity are directly linked to concerns with efficiency in government, yet they draw on past experiences and encompass a broader range of global and national economic issues. Above all, quality management teaches managers and workers that organizational change is an achievable goal.

TQM IN THE PRIVATE AND PUBLIC SECTORS

In the 1980s, U.S. industry faced the grim prospect of greater international competition, lower profits, and shrinking global market share. Business leaders responded by “reinventing” the internal work environments of their corporations. They rediscovered the importance of all types of customers—internal and external—and began “empowering” employees with the authority, training, and trust needed to better serve customers. In the effort to regain competitive global economic market share, even the most disciplined firms found that demand for higher-quality goods and better customer services often exceeded the capacity of management systems and/or the motivation of employees to consistently “meet or exceed” customer expectations. Although several firms underestimated the discipline, time, and training required to change management procedures and empower employees, many embraced the new “quality paradigm.” As the quality message spread, more companies responded by relearning how to simultaneously be more competitive, quality focused, and customer driven.

The 1990s also witnessed a profound restructuring of many basic productive enterprises, in both manufacturing and service industries, resulting in acquisitions, downsizing, and mergers of companies within the United States and abroad. At the same time that TQM was being widely applied, a more aggressive movement emerged, urging the application of radical change to “reengineer” corporations.^[12] Many large multinational firms quite literally reengineered their business processes from the inside out using BPR, referred to by many as “TQM with a vengeance,” a short-lived management fad that was quickly seen as a transparent rationalization for downsizing and massive corporate lay-offs. The expanded use of the Internet, World Wide Web, and e-commerce has only accelerated these trends. Leading private sector firms mandated that *their suppliers* demonstrate commitment to BPR by meeting higher-quality standards and showing enhanced responsiveness to customer requirements. Many of them literally “broke up” into smaller, more manageable, decentralized service units to establish closer working relationships with customers and suppliers. Given the sheer size and scope of the effort, mistakes were inevitable.

In some instances, theories of quality improvement were misunderstood, misapplied, or not fully implemented.^[13] Unrealistic expectations prompted employee resistance, and controversial “quality bureaucracies” were created in many public and private organizations. Predictably, a “TQM backlash” fostered cynicism and dampened enthusiasm for further non-manufacturing applications. Public sector reforms are hampered in

the public sector by: 1) perceived negative experiences with private sector methods and models; 2) the long-term time frames of many TQM programs; 3) rigid management structures; and 4) a lack of theory-driven research on how to empower, motivate, and reward public employees for systems changes and customer service quality. One observer argued that so-called “pure” quality initiatives were ill suited for public sector organizations, citing four key limitations: 1) defining the customers of government is ambiguous; 2) public administrators are service rather than product oriented; 3) public agencies are input rather than output oriented; and 4) politics works against long-term leadership and constancy of mission.^[14] Others suggested that political leadership is necessary to achieve any change, and that governments are primarily small service organizations that can (and must) be responsive to customers.^[15,16] Despite some resistance, TQM was used extensively during the 1990s to improve a wide range of federal executive agencies, public utilities, and state and local governments. In addition to extensive federal reform efforts, many states and local governments replaced traditional bureaucratic hierarchies with “networked” structures, empowered employees, and redesigned performance management systems to better serve customers.

CONGRESS, TQM, AND THE NPR

Since 1988, TQM has been the official management improvement system for all federal executive agencies. The U.S. Office of Management and Budget coordinates joint public and private governmentwide quality improvement initiatives in the executive branch. Congress supported federal executive branch reform with budget and paperwork reduction agreements, spending limits, mandated use of results-oriented management systems, and the creation of a national award for quality improvement. In addition, management reforms, such as the Chief Financial Officers (CFOs) Act of 1990 and the Government Performance and Results Act of 1993, reinforced the federal TQM reinvention strategy. The National Performance Review (NPR) encouraged federal agencies to implement TQM to increase efficiency, better serve customers, develop outcome-oriented performance measures, monitor results, and publicly post key performance measures.

The NPR (1993–2001) challenged federal agencies to cut red tape, downsize, deregulate, and provide customer service equal to “the best in business.” Inspired by the best-selling book *Reinventing Government*,^[17] the NPR was a controversial mix of theory and ideology that focused on “market-driven”

solutions to the perceived inefficiencies in the delivery of government services. Specific, and often contradictory, recommendations included putting customers first, decentralizing decisions, empowering front-line employees, reducing administrative costs, and focusing on results. After nearly a decade of progress, comparative measures of federal performance are now available and CFOs in all federal agencies must provide systematic financial reports to Congress and to the president. The ultimate success of the federal government’s aggressive drive for quality management and reinvention depends on the soundness of its theories and how well it is implemented in the field.^[18,19]

REWARDING QUALITY IMPROVEMENT EFFORTS

Recognition and award programs are also used to reward quality management efforts and acknowledge employees for exemplary customer service. Although it is sometimes difficult to respond to all customers of public organizations, quality awards can demonstrate how governments in *specific* service areas are better serving customers. Governments can use quality awards to reinforce these goals, reward success, and provide objective benchmarks to help guide the transition to a customer-focused government. Awards, benchmarking, and charter marks been used successfully by many governments to compare results, achieve policy goals, highlight achievements, and guide customer service quality improvement efforts.^[20] There are now hundreds of national, state, and local quality awards that are a largely untapped, but increasingly rich, reservoir of detailed information about how various types of government agencies can successfully change management processes to effectively respond to customers. Cities, counties, and states are benchmarking the best practices from leaders in various processes. In this way, management improvements are being made on the basis of experience in other, similar jurisdictions. At the local level, public agencies are learning from each other how to best respond to the needs of their customers. Many other public agencies, non-profit organizations, and service organizations are also involved as co-partners. Forty-five states have established state quality awards patterned after the federal government’s Baldrige Awards, and many localities have also launched successful customer-driven quality improvement drives. Research findings generated by successful applications offer administrators a clearer understanding of their customers’ needs and how they can empower employees to meet them.

FUTURE OF QUALITY MANAGEMENT IN GOVERNMENT

Public organizations have now increased their capacity to measure performance, increase productivity, improve customer service, and reward quality management efforts. Links between the executive and legislative branches have been established to achieve greater accountability, efficiency, and productivity with the adoption of new management systems. The principles of TQM are widely practiced in many reinvented agencies, and numerous quality awards provide “benchmarks” for others to follow. Models for reform were based on earlier quality improvement systems initiated by the private manufacturing sector and thus not easily converted to the public service sector. Many public agencies learned the hard way that it is easier to start a productivity improvement initiative than it is to maintain one. The reinventors were accused of going too far in changing government management procedures to “run government like a business” and many public managers were criticized for resisting attempts of improve performance out of fear that their positions might be threatened. The Bush administration (at least prior to September 11, 2001) clearly signaled a preference for the use of non-governmental means to achieve the same ends: public-private partnerships; tax cuts; privatization; and greater use of charter schools, faith-based organizations, and vouchers.

The application of quality management principles in government reflects the century-old debate about the “proper” relationship between private interests, politics, policy, and administration. Which models—public, private, non-profit, or some combination thereof—best reflect the public interest in turbulent times? The future direction of the quality movement in government is now at a crossroads: at issue is whether the incremental publicly oriented efforts of the last decade will continue or be replaced altogether with contracting out, vouchers, privatization, and partnerships with non-governmental organizations.

Managing Mutual Commitments and Expectations: Contract Administration in Public Labor Relations

D. S. Chauhan

Department of Political Science, Bowling Green State University,
Bowling Green, Ohio, U.S.A.

INTRODUCTION

The collective bargaining process is governed by a set of regulatory rules, legislative policy, body of judicial decisions or opinions, and a contract mutually agreed upon by the management and the employee union. A contract establishes a set of rules, commitments, and expectations legally binding on both the labor and management. As it emerges from the negotiating process, a contract or a collective bargaining agreement is a mutually agreed upon set of rules that have been jointly developed to guide an employer–employee relationship for a fixed period of time. Because collective bargaining represents an adversary relationship involving the representatives of two groups with divergent goals, the emerging rules are likely to represent numerous compromises by both parties in dealing with contract negotiation or administration. These rules provide the framework to govern day-to-day relationships between the two parties.

Upon the ratification of the contract by the union, the labor relation's process enters the contract administration phase, where labor and management have to abide by the provisions of the agreement under the supervision of the management and the vigilance of the union Steward. Because the contract administration is a bilateral process, it recognizes the goodwill, cooperation and understanding of labor and management to build a successful labor relation's program through shared responsibilities in day-to-day administration of the contract.^[1]

NATURE AND SCOPE OF CONTRACT PROVISIONS

The length, subject matter, and details of an “agreement” or “contract” represent the complexity and unique aspect of collective bargaining relationships evolved over a long period of time. For instance, the length of contract and the complexity of contract provisions may differ in well-established contractual relationships and the newly evolving relationship. Specificity of provisions may cover 20 to 100 pages. Also, the subject matter and content of contractual provisions may differ in various contracts. Most

contracts, however, contain a preamble highlighting the purpose and importance of cooperative leadership, mutual trust, and shared responsibilities in promoting effective contract administration. For instance, the agreement reached between Kent State University and the faculty union states, “The parties to this agreement desire to establish and maintain an atmosphere of mutual understanding and cooperation . . . The parties endorse the university's commitment to the achievement of optimal conditions of intellectual discovery, human development and responsible social changes.”^[2]

The substance of most contract provisions can be divided into three major categories:^[3]

1. *Fixed provisions*: Fixed provisions in majority of contracts pertain to wage rates, union security, and the date of enforcement and reopening of new contract negotiations.^a
2. *Contingent provisions*: Contingent provisions cover lay-off regulations, promotions, transfers/reassignments, and severance and discharge.^b
3. *Dispute resolution provisions*: Because the collective bargaining is an adversarial process, all contracts contain dispute resolution provisions focusing on mediation, fact-finding, and arbitration procedures to resolve collective conflicts involving contract negotiations, interpretations, and the fulfillment of mutual commitments and expectations.^c

The other important provisions include grievance procedures, management rights clauses, and discharge procedures.

^aFixed provisions normally include contract duration, the bargaining unit, union recognition and rights, management rights, wages, hours of work, benefit plans, union security provisions, antidiscrimination clauses, residency requirements, union political activities, official time, and reopening clause.

^bContingent provisions include discharges, layoffs/RIF procedures, recall of laid-off workers, promotions, work scheduling, work assignments, transfers, and discipline.

^cConflict resolution provisions include no-strike provision, multistep grievance procedures, ULPs, contract interpretation clauses, and the use of mediation, fact-finding, and arbitration procedures.

CONTRACT ADMINISTRATION PROCESS

When the contract is agreed upon by the management and ratified by the union, it must be enforced by the management through consultative leadership with the employee union and the Steward. A contract is no better than its administration. Because managers in most public organizations have the responsibility for supervising personnel, organizing and directing the operations of the agency, and controlling the utilization of human and material resources, they undertake the primary responsibility for contract administration. Contract administration is not separate, but it is an integral part of the labor relations process providing an opportunity for cooperation and resolution of conflicts and differences through effective contract interpretation.

Because the labor agreement covers a wide range of activities in the collective bargaining process, there is a paramount need for some degree of conformity and consistency in the administration of the contract. A good contract administration also requires the development of guidelines and policies that help management to pursue a systematic approach in dealing with personnel problems, defining procedures with mutual agreement, and identifying the role of both parties. Resolution of grievances as well as the satisfaction of the union membership must be timely. Communication support among managers and between the management and the union is also vital.^[4]

MAJOR STRUCTURAL PROBLEMS

As discussed earlier, a contract covers a wide variety of activities, expectations, and a set of procedures to deal with emerging problems experienced during the process of execution. Although the primary responsibility for the execution or the administration of the agreement/contract lies with the management, the union's Steward oversees that all the provisions of the contract are being applied uniformly and consistently to guarantee the equal application of the agreement. Although the totality of the contract's execution is essential, the following are the components or processes that characterize the major elements in the contract administration process:

1. *Role of supervisors:* Although the management is responsible for ensuring effective execution of the contract, supervisors are considered to be the key in providing linkage between the management and the rank-and-file workers. These supervisors work in close cooperation with the union Steward, because they possess an intimate knowledge of work activities and problems encountered by the management and workers. Studies of the Steward function and relationships with

supervisors reveal that the relationship between the two, to a large extent, has been a positive factor in improving supervisory skills and facilitating equitable treatment of employees in personnel policies and practices.^[5]

2. *The grievance procedure:* During the course of negotiations or contract administration, differences or disagreements on a variety of issues may arise between the management (supervisors) and union Steward. Such differences or disagreements may lead to threats of strike and must be resolved through effective interpretation of related contractual provisions in a timely manner. One important aspect of contract administration is the grievance procedure that is aimed at resolving the labor-management differences or disagreements. All contracts contain a formal grievance procedure authorized by the legislative statute or agreed upon by the parties as part of the contract. The enabling legislation or a negotiated contract can also specify the nature of issues that the employees may be able to grieve. However, the civil service regulations can constrain employees to grieve on such issues as discipline and discharge, just cause, management rights, past practice, overtime, reinstatement/reimbursement from suspension, leaves of absence, promotion, union security, and disciplinary policies and procedures.^[6] If the union believes that the employer is not complying with the agreement, it often resorts to enforce its position by the same show of force that won those terms in the first place.^[7]

The grievance procedures/appeal systems in the public sector are mandated by law or are agreed upon through contract provisions. They typically involve three to five steps^d with the informal discussion or commencement of the grievance process finally requiring a written grievance leading to arbitration.^[8]

3. *Unfair Labor Practices (ULPs):* At any point in the organizing process or during the process of collective bargaining, the administration or the union or its bargaining agent may engage in some activity which may be considered unfair or may have negative effects on the outcome of either organizing efforts, collective bargaining

^dA typical formal grievance procedure may include the following steps: Employee initiates the grievance: 1) Employee discusses grievances or problem orally with supervisor or union Steward; 2) Grievance is put in writing and submitted to supervisor or other line manager; 3) Grievance is appealed to upper management or labor officer; and 4) Union decides on whether to appeal unsolved grievance to arbitration for a binding decision. Some grievance procedures may contain up to six or seven steps.

or contract administration may constitute an unfair labor practice. The employee union collectively or jointly with the individual may also grieve against any management practices or procedures that are considered by the union as unfair labor practice. A grievance can be filed by either party involving interference, domination, discrimination, discharge, refusal to bargain, or repeated failure to process grievance, and cause the union or employer to violate provisions or prohibitions imposed by the law or a negotiated contract.^e

4. *Strike threats and dispute resolution:* The major disagreements associated with interpretation, negotiations, and collective bargaining may sometimes lead to work stoppages or strike threats during the process of contract administration. Such job actions may invoke the use of such formal procedures as mediation, fact-finding, and arbitration involving neutral third

parties. Recent developments in collective conflict resolution, through building arbitration of labor-management disputes, are considered to bring some degree of finality. However, the preferable strategy of resolving disputes should be based on cooperation and not on confrontation.

In sum, important structural problems in contract administration involve infringement upon management rights, seniority and promotion qualifications, statutory limitations on grievance procedures, civil service rules limiting subjects that can be discussed in collective bargaining, and emphasis placed on the importance of past practices. Similarly, the key elements or components in contract administration focus on grievance procedure/arbitration, role of the upper management and supervisor as a primary line, role of the Steward and union leadership, management rights, interpretation of the contract language, the personnel offices as a clearinghouse, and disciplinary procedures.

^eAn ULP may be committed by the public employer or the employee organization. They may include the following:

1. Public employers/agents or their representatives may not:
 - a. Interfere, restrain, or coerce employees.
 - b. Initiate, create, or dominate in the conduct of union business.
 - c. Discriminate in hiring, layoff, and advancement of employees.
 - d. Discharge an employee for filing a grievance.
 - e. Refuse to bargain with recognized union bargaining agent.
 - f. Fail to process grievances.
 - g. Lock out or prevent employees from performing their legal duties.
 - h. Cause or attempt to cause an employee organization to violate prohibitions.
2. Employee organizations/agents or their representatives may not:
 - a. Restrain or coerce employees in exercise of their rights.
 - b. Cause or attempt to cause an employer to violate legal or contractual obligations.
 - c. Refuse bargain collectively with a public employer.
 - d. Call, initiate, maintain, or conduct a boycott against any public employer or picket any place of business of a public employer, or on account of jurisdictional dispute.
 - e. Induce or encourage any individual employed by any person to engage in a strike or work stoppage that is prohibited.
 - f. Fail to fairly represent all public employees in the bargaining unit.
 - g. Induce or encourage any individual in connection with a labor relation's dispute simply to picket at the residence of a public official.
 - h. Engage in picketing, striking, or other concerted refusal to work without written notice to the public employer or employee relation's board.

OBJECTIVES OF POSITIVE CONTRACT ADMINISTRATION

The success of contract administration will ultimately determine if all the time and energy devoted to the formulation of the collective agreement will be justified by subsequent developments.^[9] The collective bargaining agreement must be administered in a manner to:

1. Provide a basis for speedy and judicious review and resolution of labor-management differences over interpretation of the terms of government.
2. Provide the organization with information about the location of sensitive labor-management areas and about inadequacies of a particular supervisor.
3. Provide employees assurance that they will receive fair and just treatment by adherence to due process in dealing with employee problems.
4. Provide the organization with a mechanism to adjust virtually all day-to-day differences between the labor and management.
5. Provide a mechanism for identifying management employee problems not covered by the agreement.
6. Provide management officials and union officers an opportunity to meet separately with the supervisory workforce and the shop Steward to review the contract provisions.
7. Provide for an interpretation of the contract by a labor officer or personnel director or any

other designated person agreed upon by the labor and management.^[10]

The success of a labor-management relations program largely depends on the effective functioning of the cooperative leadership process in which the management, the union, and the employee groups work together toward the effective execution of the contract. In 1991, the U.S. General Accounting Office conducted a study of the federal labor relations program and reported that “a cooperative or joint problem-solving orientation was lacking... It also noted that labor-management cooperative programs in private sector reflect the growing view that an (us versus them) approach is outdated and unworkable.”^[11] Consequently, in 1993, President Clinton issued an Executive Order 12871 calling for a change in the labor-management relations “So that managers, employees, and employees’ elected union representatives serve as partners... It established a National Partnership Council to advise the President on labor-management relations, to support and promote labor-management partnership, and to recommend statutory changes needed to support a cooperative and reform oriented approach to federal labor relations.”^[12]

Achievement of goals of the Executive Order 12871 are hard to measure for a variety of reasons. However, the traditionally adversarial culture of federal labor relations was replaced during the Clinton Administration by a cooperative culture that encouraged mutual respect, partnership, and goal-oriented cooperation among federal agency heads.^[13] The joint labor-management committees (LMCs) at the state level have also emphasized to provide a mechanism for cooperative efforts to resolve a variety of problems associated with workplace safety, quality control, and communication. The major cities, such as Phoenix and San Diego, as well as the states of Ohio and Massachusetts have negotiated agreements establishing LMCs.^[14]

CONCLUSION

The impact of collective bargaining on personnel management systems in public management has produced a need for more collaborative or cooperative efforts in public affairs aimed at effective management and provision of goods and services to the people. The changing organizational culture and work environment are influenced by family and diversity issues, communication task management technologies, changing employee attitudes, behaviors, and values, and the need for participative management. The issues that may significantly influence the nature of employer-employee relationship, the bargaining powers, and the contract

administration in the twenty-first century may include new realities about domestic partners, day care, elder care, flexible scheduling, drug testing, job sharing, flexible staffing, flexible benefits, flexible leaves, and flexible location. The changing workplace would require more positive attitudes to facilitate effective communication, and exchange of information in good faith to facilitate labor-management cooperation.

Increased unionization and collective bargaining in the public sector during the past three decades have led toward the centralization of public management structures and control systems.^[15] Public managers are forced to take a proactive role in providing cooperative leadership in public labor relations producing significant decline in the legislative influence over personnel matters in jurisdictions where collective bargaining and the practice of contract administration are well developed.^[16]

Disagreements in contract’s administration would be largely determined by the size and complexity of the organizations, contractual arrangements, working relationships between the management and union leadership and members, managerial attitudes and willingness to work together, changing organizational culture, and informational technology and task management. Living with the contractual agreements would require greater harmony or precedence of contractual obligations over the traditional “rules of the workplace” characterized by civil service rules and the merit system.

Market Failure, Theory of

Brian E. Dollery

*School of Economics, University of New England, Armidale,
New South Wales, Australia*

Joe L. Wallis

*Department of Economics, University of Otago, Dunedin,
New Zealand*

INTRODUCTION

The appropriate role of government in contemporary advanced industrial democracies is a complex and controversial issue that remains unsettled. A vast research effort has been devoted to resolving this issue. Social scientists, including anthropologists, economists, policy analysts, political scientists, public administration specialists, and sociologists, have devised numerous approaches to the study of the nature and role of government, with varying degrees of success. One of the more successful approaches to the analysis of the state has been developed by welfare economists in the form of the theory of market failure. In essence, the market failure paradigm examines the operation of the economy and prescribes government intervention when markets “fail” on the grounds of either economic efficiency or equity.

Although the origins of the theory of market failure may be traced back several hundred years in the history of economic thought, the contemporary version of this theory owes much to William Baumol’s^[1] *Welfare Economics and the Theory of the State*; Paul Samuelson’s^[2] article entitled “The Pure Theory of Public Expenditure” in the *Review of Economics and Statistics*; and Francis Bator’s^[3] article entitled “The Anatomy of Market Failure.” Notwithstanding the success of the market failure paradigm in providing a rigorous conceptual framework to guide policy makers in the design of public policies, from the beginning it contained several serious limitations. Mitchell and Simmons^[4] have described these problems as follows:

Because no human institution is perfect, it is easy to find imperfections or “failures.” It is even easier if, like the welfare economists, you only concentrate on the economy and do not recognize the effects of the political system on the shape, direction, and rules of the economy. It is also easy to call for government intervention if you have no corresponding theory of how government functions. (p. xvii)

ADAM SMITH’S “INVISIBLE HAND”

The notion that “the pursuit of rational self-interest by individuals engaged in the exchange of property rights through market institutions results in socially benevolent outcomes” represents one of the most important insights of economics, and can be traced back to Adam Smith’s famous doctrine of the “invisible hand” in the *Wealth of Nations* in 1776. In essence, this argument holds that maximizing behavior by individual economic agents in market relationships generates a socially rational use of scarce resources under certain defined conditions. Moreover, the voluntary exchange of goods and services through the market mechanism is itself a positive sum game for all participants because exchange enhances mutual welfare. Because the behavior of *homo economicus* leads automatically to Pareto optimality in consumption and production, this eliminates the necessity for active policy intervention, and thus creates a strong case for the role of government to be limited to the definition and enforcement of property rights.

Since Arthur Pigou’s momentous *Economics of Welfare* in 1920,^[5] modern welfare economics has been largely concerned with the development and refinement of the conditions necessary for the effective operation of the invisible hand—that is, the underlying conditions that must be met for a perfectly competitive or decentralized system of price determination to efficiently allocate scarce resources amongst alternative ends. The discovery of these necessary and sufficient conditions for economic efficiency led to the systematic identification of generic instances where markets “failed” to produce allocatively efficient results. In essence, the existence or absence of several factors can prevent the rational self-interest in exchange or market processes characteristic of the invisible hand from generating socially desirable outcomes. This phenomenon is market failure and provides the intellectual basis for extensive government intervention aimed at achieving economic efficiency in market

economies. Market failure in this sense refers to the inability of a market or system of markets to provide goods and services either at all or in an economically optimal manner. Market failure is thus defined exclusively in terms of economic efficiency in general, and allocative efficiency in particular. The market failure paradigm for microeconomic policy making assumes that governments intervene in the public interest to restore economic efficiency. The market failure paradigm is thus a normative theory of government intervention insofar as it prescribes how governments “should” behave. As we discuss, the market failure paradigm can be extended to include distributional or equity elements.

SOURCES OF MARKET FAILURE

Economists have identified numerous sources of market failure, and indeed instances of real or perceived market failure are probably limited only by the imaginations of the economists. However, textbooks typically emphasize six main forms of market failure, which we review below.

First, for Adam Smith’s invisible hand to operate properly, markets must be competitive rather than monopolistic or oligopolistic. Various reasons exist for the absence of competition in some defined market. Geographic factors such as large distances or isolated locations can mean limited competition. For example, the vast outback of Australia contains numerous small communities often serviced by a single retail supplier. Similarly, limited ownership of some natural resource can confer monopoly power on a producer. Governments may often create monopolies through the legal system. For instance, patent laws grant monopoly rights to inventors for specified time periods. Similarly, gaming operators are usually given exclusive control over casinos in particular jurisdictions. However, perhaps the most significant in the present context are barriers to entry into an industry, which arise from increasing returns to scale. This necessarily implied decreasing average costs over large volumes of output and the potential for natural monopolies to arise. Because of the technological nature of production in industries of this kind, competition simply cannot exist. This source of market failure is most commonly evident in the provision of services such as electricity, water, railway networks, and post offices.

Traditionally, government policies toward competition as a potential source of market failure have taken two general forms. First, laws have been promulgated that seek to prevent collusion and other defined types of anticompetitive conduct among producer groups. Second, public policies have sought to deal with the problems associated with natural monopoly

by either nationalizing the industry in question (historically, the preferred approach in western Europe), or by regulation, especially rate of return regulation (the policy instrument most favored in the United States).

A second source of market failure resides in the existence of positive or negative externalities involving an interdependence between consumption and/or production activities, and resulting in a divergence between private and social costs and benefits. In essence, the problem posed by externalities is that the resource allocation yielded by markets will not be efficient because market prices do not reflect the full costs and benefits involved, and accordingly will not generate socially efficient levels of consumption and production. Literally, thousands of kinds of externalities exist. Perhaps industrial pollution is the most widely cited example of a negative production externality. By contrast, industrial agglomeration along the lines of Silicon Valley represents a positive production externality where separate economic activities reinforce each other and lower production costs. A myriad of consumption externalities can be readily identified. Drinkers in a bar enjoying listening to a jukebox constitutes a positive consumption externality, whereas tired neighbors attempting to sleep alongside a rowdy party signifies a negative consumption externality!

Conventional policy responses to externalities have almost always resulted in government intervention. Two generic forms of intervention can be identified. First, direct intervention sought to supersede markets and embraced direct government production and regulation. Thus, governments often impose standards of food hygiene, water and air pollution, etc., and provide vaccination and other medical services in the event of epidemics. Second, indirect intervention attempts to work through the market mechanism by means of taxes and subsidies. For instance, because education is supposed to confer benefits on society at large, in addition to those bestowed on the recipients of education, it receives large subsidies from the fiscus.

However, in principle at least, the problems posed by externalities do not necessarily require government intervention. The so-called Coase theorem, which stemmed from Ronald Coase’s^[6] brilliant paper on “The Problem of Social Cost,” demonstrates the validity of this proposition. In essence, the Coase theorem holds that if nothing obstructs efficient bargaining between parties affected by an externality, then people will negotiate until they reach a Pareto efficient outcome. Accordingly, no government intervention is necessary. However, for the Coase theorem to work requires the invocation of several heroic assumptions, including the existence of costless bargaining with no transaction costs.

A third kind of market failure stems from the inability of private markets to produce public goods. Numerous public goods exist that cannot be provided through the competitive market process due to their particular characteristics. Pure public goods are said to be both non-rival in consumption and non-excludable in consumption. Non-rivalrous consumption occurs where one person's consumption does not reduce the good's availability for consumption by others as, for instance, in the case of national defense. Non-exclusion means that producers of the good are technologically and/or economically unable to prevent individuals from consuming the good as, for example, in the case of radio and television transmissions.

Given these characteristics, there is no incentive for private firms to provide public goods; accordingly, they must be furnished collectively through either private voluntary arrangements or through government agencies. If public goods are provided through the public sector, this does not necessarily imply public production, but may simply mean public provision through contracting. Thus, although some public goods, such as law and order, are produced directly by government through justice and police agencies, other public goods, such as highways and water reticulation systems, are provided by governments, but constructed under contract by private firms.

The efficient operation of the invisible hand implies that markets will provide all goods and services where demand is sufficient to cover the costs of supplying these goods and services. Where this does not occur, economists argue that incomplete markets have resulted in market failure. It is often argued that this form of market failure is especially evident in insurance markets and capital markets. In many countries, governments intervene to provide loans (or at least guarantee loans) to categories of home mortgage borrowers, small businesses, export industries, and farmers in the belief that private credit markets would not provide capital in the absence of such intervention. A related form of market failure due to incomplete markets focuses on the purported absence of complementary markets. Complementarity between markets is said to occur where activity in one market is dependent on the existence of other, related markets. For instance, large-scale property redevelopment in modern cities typically requires extensive coordination between local authorities and many private firms, which is often provided by government development agencies on the assumption that the necessary level of coordination would not be forthcoming without public intervention.

An additional source of market failure resides in the fact that economic agents on one or both sides of a market may possess incomplete information, or available information may be asymmetrically allocated

among market participants. Akerloff's^[7] famous analysis of the market for used cars is a good illustration of this source of market failure. In advancing the concept of adverse selection, or a situation in which those on the informed side of the market self-select in a way that harms the uninformed side of the market, Akerloff argued that in used car markets sellers typically possess better information than buyers. Because sellers are more adept at picking "duds" or "lemons" than buyers, buyers will realize the possibility that they may inadvertently purchase a "dud" is high and offer only "discounted" prices to reflect this perception. In turn, sellers will be unwillingly to part with good used cars and will sell only "duds" or "lemons." The final outcome will be an adverse selection process where "lemons" crowd out good used cars.

Market failure due to information failure has led to widespread government intervention in developed market economies. Much public policy making has focused on measures to protect consumers, especially product labeling and the disclosure of product content. But direct government intervention has also been evident. For example, weather forecasting is usually produced by public agencies as a means of disseminating information on weather patterns.

A final source of market failure is often argued to exist in the macroeconomics of market societies in the form of the business cycle. Periodic downswings in economic activity result in unemployment and falling incomes, whereas upswings in economic growth may generate inflationary episodes. Macroeconomic instability of this kind is usually met with government intervention in the guise of macroeconomic policies intended to flatten the business cycle. Typically, these macroeconomic policies seek increased economic activity during recessionary periods and decrease such activity during boom periods.

ETHICAL CONSIDERATIONS

Thus far, we have only considered market failure from the perspective of economic efficiency. If markets failed to yield economically efficient outcomes, then we have seen that a *prima facie* case for government intervention can be made on efficiency grounds alone. But even if markets do generate economically efficient outcomes, additional ethical arguments may still be invoked to justify a role for public policy. This, of course, requires a somewhat broader definition of the meaning of market failure. Wolf's observation that "markets may fail to produce either economically optimal (efficient) or socially desirable (equitable) outcomes" is a good example of a broader definition (Ref.^[8], pp. 19–20).

The introduction of equity or fairness considerations into economic analysis brings with it complex issues,^[9] not least the fact that a virtually inexhaustible range of plausible standards for judging equity exist. Quite apart from the difficulties raised by the existence of the myriad of possible equity criteria, further complications arise when different methods of approaching ethical questions are considered. For example, a useful distinction can be made between approaches to equity, which focus on distributive processes, opportunities, and outcomes, respectively. Thus, an approach that emphasizes distributive outcomes might call for equality between all individuals. But this would ignore the procedural aspects of distributive outcomes. For instance, it is entirely conceivable that unequal distributions could be fair if they are the result of fair processes of exchange. By the same token, an approach that embraces procedural fairness to the exclusion of outcomes would allow massive income and wealth differences to occur. Moreover, both the outcome and procedural approaches neglect initial endowments enjoyed by individuals in society. But considerations of equality of opportunity require complex interpersonal judgments on the inherited abilities of people and their socioeconomic backgrounds. It is clear that the adoption of any of these three generic approaches to fairness involves trade-offs between processes, opportunities, and outcomes, not to mention more general trade-offs between equity and efficiency.

Notwithstanding these complications, three common ethical arguments are often used to support government intervention. First, widespread support exists for the contention that the distributive results of efficient markets may not meet socially accepted standards of equity, or accord with a desire to reduce extremes of wealth and poverty. Moreover, practical politics tends to emphasize distributive issues. Wolf^[8] put the matter thus:

[M]ost public policy decisions are usually even more concerned with distributional issues (namely, who gets the benefits and who pays the costs) than with efficiency issues (namely, how large are the benefits and costs). (original emphasis) (p. 30)

Equity-based distributional arguments along these lines have been used to justify massive redistribution programs characteristic of the modern welfare state. Specific programs range from targeting beneficiaries, such as the Aid to Families with Dependent Children program in the United States, to universal coverage, such as the Medicare system in Australia.

A second line of argument is based on the notion that people do not always behave in their own best interests. For instance, unless compelled by law, some citizens might not send their children to primary school or wear seatbelts. Others might ingest dangerous narcotics or watch violent pornographic movies. Arguments against these kinds of behavior are based on the concept of merit goods, not on distinctions between private and public goods. Merit goods are defined “as goods the provision of which society (as distinct from the preferences of the individual consumer) wishes to encourage or, in the case of demerit goods, deter” (Ref.^[10] [p. 78]). Thus, government intervention in the form of subsidies to the performing arts or prohibitions against marijuana smoking can be justified.

A further common (if highly contentious) ethical argument for public policy intrusion into economically efficient market outcomes is based on the idea of equal economic opportunity. It is sometimes claimed that markets resort to ethnic, gender, or racial stereotypes as a filtering device in labor markets, and that these biases are reflected in employment patterns. Exponents of these arguments call for government intervention in labor markets in the form of equal opportunity programs and affirmative action laws to improve the job prospects for minority groups.

Mathematical Modeling

Roger J. Beck

*Department of Agribusiness Economics, Southern Illinois University Carbondale,
Carbondale, Illinois, U.S.A.*

INTRODUCTION

To some people, it is inconceivable that mathematical models could capture economic growth. Recruiting new firms to the area or retaining existing firms does not require mathematics or even economics. It is a matter of persuasion and negotiation. However, if the goal is to become familiar with the process of business location decisions and whether a firm continues production in an area, it can be useful to develop a model that regularizes the decision-making process. Then the model can be tested with data to determine whether location and retention is a random process. If it is not, and the model has variables that can be manipulated, the community has some control over its economic destiny.

UNIT OF ANALYSIS

Modeling community economic analysis requires that the community be the unit of analysis. What constitutes the community? The community has spatial dimensions constructed from economic considerations. Where do people shop? Where is their primary place of employment? How do they interact and communicate with each other? These are questions that, if data are gathered and analyzed, can identify communities in a spatial sense. The term “region” is often used interchangeable with “community,” with a difference being that regions have historically been designated on the basis of primary production activities. The Coal and Steel Region of Europe or the Piedmont, Corn Belt, or Delta regions of the United States are examples. A more current use of community is “Silicon Valley.” That is, community implies interactions around some unifying social or economic activity.

But what really constitutes that community? There are discrete units that comprise the community, and they interact with and among each other. They are households that supply resources of production such as land, labor, capital, and entrepreneurship, and are rewarded with rent, wages and salaries, interest, and profits, respectively, for having the insights, knowledge base, and willingness to assume risk in anticipation of

returns that exceed costs and compensate the supplier of the resource. Businesses combine these resources to produce a product or service that can be sold at a profit to sustain the business. Mathematical modeling requires developing equations that describe and capture the essential elements of this process. The model developed ought to be comprehensive, yet flexible enough to be capable of addressing questions posed by the regional planners, decision makers, and even economic development researchers.

METHODS OF ANALYSIS

The essential elements of that model should include demand characteristics of the product or service being produced; supply considerations including availability of resources used to produce the product or service; location considerations of markets, resources, and associated costs; institutional considerations; and technological changes that affect all the above.

Export base models have a certain appeal because of their inherent simplicity and their apparent adaptability to econometric models. An export base model states that community growth is a function of community export performance. The value of the theory is that it emphasizes the openness of a community economy, and the role played by markets for the goods and services produced by the community that emanates from outside the community. Yet, the model ignores investment, immigration of persons, and flows of capital as well as labor. Thus, it is really not an acceptable mathematical model of community growth and development.

Economists often rely on neoclassical models to explain community growth. This would be a world in which perfect competition, complete certainty, and marginal adjustments in prices, outputs, and locations rule. This type of world probably only exists in classrooms and textbooks. The existence of space, that locations of consumption and production affect community economics, is incompatible with these restrictive assumptions. One of the reasons it has been used so extensively is that it subsumes a theory of factor mobility and economic growth. Flows of product,

labor, and money occur if the rate of return or reward differs, until these rates approach some constant allowing for differences in transport costs.

There is a set of mathematical models that vary as far from neoclassical models as can be imagined in form, substance, and predicted outcomes. Neoclassical models predict convergence of income, while cumulative causation models predict per capita income divergence. Myrdal^[1] argued that the play of economic forces tends to increase, rather than decrease, inequalities between regions. In recent times, the divergence between rural and urban regions has indeed widened rather than narrowed. Myrdal stresses locational advantages as well as resource endowments that set off a trigger, which results in ever-widening per capita incomes rather than the predicted convergence.

Econometric models have been used to predict economic growth of a community; these models are primarily forecasting models. These models normally use time-series data rather than cross-sectional data required by community growth. They are best suited when used in conjunction with neoclassical models.

Specifically, the model is expected to explain factors that affect the supply of the resources at a point in space where the production of the product or service takes place. This implies that labor force participation models be combined with commuting models to predict the quantity of labor with specific skills at given wage and fringe levels available at the point of production. Such a labor force function could be specified that hypothesizes that the labor force at a point in space is a function of socioeconomic characteristics, and a variable reflecting geographic access to employment opportunities at a point in space. Other resources such as telecommunication services, land use, and input supplies could be similarly modeled to reflect their availability.

It is known that each economic entity not only produces goods and services for final demand—that is, household, capital goods for businesses, exports from the community, and for government—but also produce goods and services for firms in the community that produce other final goods. Walras stressed the interdependence between the production sectors of an economy with his general equilibrium model in the 1870s.^[2]

The first empirical application of the input–output (I–O) model in the Western world dates from 1936, when Leontief published an I–O system of the U.S. economy.^[2] Leontief simplified Walras' generalized model so that equations associated with it could be estimated empirically. He used two simplifying assumptions. First, the large number of commodities in the Walras' model was aggregated into relatively few outputs, one for each industrial sector. Second, supply equations for labor and demand equations were

abandoned. The remaining production equations were expressed in their simplest linear form.

The model is simple, however, and lends itself to empirical analysis. Its key variables are the outputs of sectors into which the economy is divided. Each sector's output consists of the sum of sales to all other sectors and final demand. The amount of each product, which each sector consumes, depends only the level of output in the consuming sector. Equilibrium in the economy is attained when the output each sector total purchases from that sector, these purchases being determined by the output of all other sectors.

The key to Leontief's analytical system is the construction of the I–O or transactions table. The transactions table shows the flow of commodities from each producing sector to all other consuming sectors, both intermediate and final. Data provided in the transactions table can be rearranged to derive a table of technical coefficients, and a table of direct and indirect requirements from which I–O multipliers are derived.

KEY ASSUMPTIONS

The first assumption is that the production functions (an industry's list of expenditures) are assumed to have constant returns to scale. This means that if additional output is required, all inputs increase proportionately. A second assumption is that there are no supply constraints. This implies an industry has unlimited access to raw and manufactured inputs, and its output is limited only by the demand for its products. A fixed commodity input structure implies that price changes do not cause a firm to buy substitute goods. A fixed commodity input structure assumes that changes in the economy will affect the industry's output, but not the mix of commodities and services it requires to make its products. The fourth assumption is that there is homogeneous sector output. This means that the proportions of all the commodities produced by that industry remain the same, regardless of total output. An industry technology assumption assumes that an industry uses the same technology to produce all its products.

IMPACT ANALYSIS

Economic impact analysis involves applying a final demand change to a predictive economic I–O model and then analyzing the resulting changes in the community economy. In practice, economic impact analysis might mean many different things. The effect of a new manufacturing plant or discontinued operations is another use. Policy analysis might require the economic effects of generating electricity at the mouth of a coal mine. What are the economic effects of removing marginal

land from agricultural production, creating buffer zones along streams and rivers? These questions are what an operational I–O model is expected to address.

Media and Bureaucracy in the United States

Mordecai Lee

*Department of Governmental Affairs, University of Wisconsin-Milwaukee,
Milwaukee, Wisconsin, U.S.A.*

INTRODUCTION

This article reviews media coverage of public administration in the United States. First, it discusses the history of such coverage and ties it to an element of American political culture, which is consistently negative toward government. Second, the contemporary state of news coverage of American bureaucracy in the early 21st century is examined. It identifies elements that contribute to and exacerbate such negative coverage, including an antibureaucracy metanarrative that tends to be embedded in journalism, the difficulty of making public administration interesting in a visual medium, the emergence of attack journalism, and the reduction in original reporting vs. the rise in punditing.

Third, possible responses by civil servants are presented. Public administrators have little influence to attenuate the antibureaucracy tilt of news coverage. However, government managers have some modest options regarding softening the hard edges of this coverage. They can professionalize relations with reporters, take advantage of opportunities to present positive stories, and utilize new digital technologies to communicate directly with the public instead of relying on the traditional intermediary role of the news media.

HISTORY

The negative view of government in American journalism is as old as America itself. The American revolutionary war was justified as a reaction to tyranny, depicted as the abusive use of government power by Great Britain against the colonists. The 1776 Declaration of Independence comprised little more than a litany of complaints about the British government. A primary vehicle for the revolution was circulars and pamphlets denouncing uncaring and distant government by Committees of Correspondence, early versions of American journalism.

With the founding of the United States, the First Amendment to the federal Constitution guaranteed freedom of the press in order to facilitate journalism's role as an instrument of democracy. The duty of an independent press was to report what government did and did not do, so that an informed public could exercise its will, whether through formal mechanisms

(elections) or informal ones (public opinion). Therefore, the ethos of American journalism was that its *raison d'être* was to cover government critically. Freed of government regulation, American newspapers were presumed to take an adversarial attitude toward government, helping guarantee democracy and the other constitutional freedoms possessed by the citizenry.

The antigovernment strain of U.S. journalistic and civic culture has been a permanent phenomenon since then. While the emergence of a merit-based and professionalized civil service in the late 19th century was a new element in the public sector, public administration was still part of government, the presumed heavy in the given narrative of American society. While muckraking was viewed as a new form of journalism at the beginning of the 20th century, it shared a world view that was not novel: government was one of the bad guys, even though Progressive reformers often turned to government to solve problems. The expose of problems in Chicago's meat packing plants was as much a condemnation of corrupt or ineffective government inspections as it was of the mendacity of big business. One staple of journalism of that era was exposing the malfeasance or corruption of urban political machines, how they misused government agencies to line their own pockets, whether with rigged bidding for purchase of goods and services or the corruption of law enforcement to protect organized crime. Reporters often called for reform, sometimes with government as the problem, sometimes as the solution, sometimes both. It was in that context that public administration emerged in the United States. Separating politics from administration through civil service reform was viewed then as a solution (although, retrospect, a chimera).

The so-called "golden age" of media coverage of the bureaucracy began with Franklin Roosevelt's New Deal, when an alphabet soup of administrative agencies sprouted up to rid the country of the Great Depression and the power of the economic royalists. Suddenly, public administration was not only the solution, but also the possessor of nearly inexplicable expertise. That made reporters more than ever dependent on the public relations staffs of the new agencies. Journalists needed help to understand and interpret bureaucratic actions into terms meaningful and understandable to their lay readers.^[1] The intense coverage of the bureaucracy—and deference to its innate fairness, wisdom, and

patriotism—largely continued through World War II and the first decades of the Cold War. Kurtz described media coverage of that era as “page after page of gray type and boring stories about bureaucracy.”^[2] However, those mid-century decades of extensive and largely informative coverage of public administration need to be seen now as an aberration, not the normal state of affairs.

The return to journalistic normalcy, of negative coverage of the bureaucracy (in contradistinction to how reporters covered politicians in general and presidents in particular) was triggered by the coalescing of several trends. In part, reporters fell out of love with public administration, after such high-profile events as the failure of Defense Secretary Robert McNamara’s bureaucratic approach to win the Viet Nam war, the domestic bureaucracy’s inability to win the War on Poverty and the seeming failure of the economic policy bureaucracy to tame inflation in the 1970s. News reporting of government, especially after Watergate, became increasingly negative. Not just the traditional skeptical and adversarial stance, but of barely disguised cynicism, disbelief, and outright hostility. All of government, whether elected or civil service, bore the brunt of that. But, most importantly, then came television.

By the 1970s, television had fully eclipsed print as the dominant news media. This had several key consequences for coverage of the bureaucracy, mostly dictated by the medium’s technological parameters. First, TV was a visual medium and public administration was hard to cover when pictures were needed. Most developments from government departments were long-running policy issues, mind numbing in detail, and took too long to explain. Sure, efforts at securities regulation were an important story, but the subject was inherently detail oriented and lacking in dramatic pictures. Second, even more than print journalism, television was best at telling short stories, which required a beginning, middle, and end, all wrapped up in the same report. Again, disadvantage bureaucracy. TV was especially good at telling dramatic and emotion-laden stories about a person, a suffering victim, who the viewers could empathize with. This kind of storytelling was conducive to covering the bureaucracy, but only when it was the bad guy, insensitively victimizing a poor innocent citizen.

By the end of the 20th century, admitted a senior reporter for the *New York Times*, “Newspapers cover governmental *process* less than they used to. Television hardly covers it at all.”^[3] And public administration is all about *process*. The trend accelerated during the first decade of the 21st century. Kettl observed that “‘Waste-fraud-and-abuse’ has become a single word in the media.”^[4] Also, there was more and more news, but less original reporting and, of that reporting, even

less of it was about departments and agencies. And what little there was almost always was negative.^[5] “Television newsmagazines regularly alternated “give me a break!” features about government gone amuck with plaintive stories of citizens in need” who were being ignored by bureaucrats.^[6]

The impact of these trends in media coverage of the bureaucracy meant that citizens increasingly considered government as “something that may be watched, and even viewed with disgust, but nonetheless regarded as a series of events with which the individual citizen is not directly involved.”^[7] This further separated the citizenry from experiencing or exercising its ownership role in democratic government, especially public administration.

AS SEEN ON YOUR TV SCREEN: CONTEMPORARY MEDIA COVERAGE OF AMERICAN BUREAUCRACY

The technical requirements for TV storytelling greatly exacerbated the pre-existing secular trends in American journalism: a general distrust of government and pervasively negative spin to coverage. Public administration was a made-for-TV heavy. As TV news sought to be increasingly entertaining and outrage promoting, a new mutation of reporting, called attack journalism, had the daily effect of depicting the bureaucracy as deviant and arousing public indignation about these transgressors of goodness.^[8] Public administrators faced a lose-lose world of a “court of public opinion in which media is the prosecutor, judge, and decision maker.”^[9] (Somewhat similar trends have begun occurring in media coverage of the non-profit sector.^[10])

Zoonen sought to identify a typology of contemporary news coverage. He suggested there were four metanarratives that reporters consciously or unconsciously used to craft their stories: quest, bureaucracy, conspiracy, and soap. Bureaucracy stories were ones dominated by motifs of incompetence, waste and “as a force beyond the individual’s control.” Zoonen also suggested that the four metanarrative categories were not mutually exclusive, with the story line of news coverage often invoking several simultaneously. Hence, bureaucracy stories were also a good fit for the running themes of quest (bureaucracy as the evil obstacle to a successful quest to do right), conspiracy (deliberate and secretive efforts to harm society), and soap (dramatic tale of an individual up against an institution that inherently suppresses individual choice).^[11] The antibureaucracy metanarrative can be embedded in many kinds of stories, even those not specifically about the bureaucracy, rather tossed in for good measure.

For news coverage that is explicitly about government agencies, Vermeer identified three categories for

such coverage: stories about failure and conflict; about high-profile agencies (such as EPA and social security) rather than obscure ones; and stories about the particular civic interest in a local media market.^[12] An example of the latter would be the interest in southwestern states in water decisions by the U.S. Bureau of Reclamation, which is part of the Interior Department. As with metanarratives, these kinds of stories were not mutually exclusive. Continuing with the same example, a story about a new Bureau of Reclamation water policy might not only fit in the third category of local interest, but also the first category, regarding conflict. Water distribution decisions can be very controversial. Different categories of users would criticize Bureau policies for proposing policies that go against their particular parochial interests.

Then television begat cable TV, which begat 24-hour cable news networks, which begat punditry as an industry. The right-of-center tilt of talk TV (and talk radio) meant commentary was inherently antigovernment, even when the right-of-center party controlled all elected institutions in Washington. In a parallel, but decreasingly separate, reality the internet begat real-time news sites (often of newspapers seeking to adapt and survive), which begat the blogosphere, which made every American a pundit. Blogging is not, strictly speaking, journalism, but in the first decade of the 21st century it began influencing and driving the media's agenda for coverage.

BUREAUCRATIC RESPONSES TO MEDIA COVERAGE

As the Darth Vader of early 21st century America, it would seem that U.S. bureaucrats have few options regarding their media image. To paraphrase the 1990s bestseller, administrators are from Jupiter and reporters are from Mercury. In Imperial Rome, Jupiter was the god of the state, while Mercury was the bearer of messages, often eloquent, but cunning and unpredictable. Can Jovian managers and mercurial reporters coexist? The adaptations required of public administration to survive necessitate some traditional as well as innovative responses. Most of all, government managers need to be philosophical about the perennial journalistic hostility to their work. This is little different from the persistence of a baseball pitcher at striking out each batter. As batters, public administrators need to be satisfied with a .300 average, even .250, since that is about as good as it will ever get.^[13]

Media Relations and Public Information

Love 'em or hate 'em, because of the essential difference between public administration and of management in

the business and nonprofit sectors, the constitutional, legal, and professional duty of the civil servant is to cooperate with the media. The government manager is part of the public sector and, therefore, must be a participant in the democratic system. Given the First Amendment and the federal Freedom of Information Act (or its state counterparts, sometimes called open records or sunshine laws), public agencies must answer reporters' inquiries, whether the answers are in the best interest of the agency or not.

However, this necessity to cooperate with the media can sometimes be converted into a virtue. Beyond passively answering unsolicited requests for information from the media, public administration can view media relations and public information as a tool of governance, which may be used to advance the mission of the agency.^[14] Its various purposes could include informing citizens of eligibility for new services; informing the public of new laws that may affect them personally; seeking to promote socially desired behavior (only you can prevent forest fires); and promoting voluntary cooperation with laws and regulations rather than relying on expensive regulatory and enforcement approaches.^[15] Also, there are circumstances when the media seeks and disseminates agency information. For example, in times of crisis and disaster, relevant departments are given virtually unlimited access to media channels to provide instructions, advice, and updates to affected populations.^[16]

In-House Staffing and Planning

Good (or, at least, occasionally decent) public relations does not just happen. It requires the agency having professional staff in its public information bureau, training all employees in the basics of handling unsolicited media inquiries, having top managers who are attuned to public relations, involving senior public information officials in decision making, and engaging in planning for foreseeable scenarios as well as unforeseeable crises.

Bypassing the Media

Other bureaucratic counterstrategies can aim at changing the context of media coverage or bypassing the media altogether. For example, through policy entrepreneurship, the administrator can gradually build support for the "do something!" dynamic of American society. By working behind the scenes to help define a problem with various attentive audiences, the government manager can create a frame of reference that invariably puts the agency in a good light, as responding to a social need.^[17] Similarly, the traditional duty of a public administrator to report to the

citizenry on agency activities can be transformed in this digital era to e-reporting, using the internet to reach citizens directly with information about agency performance.^[18]

CONCLUSION

A natural human tendency is to complain about a situation that one is dissatisfied with. Like most Americans, reporters complain through their journalism about bureaucracy and then bureaucrats complain about hostile media coverage. The difference between the two is that reporters have the power to frame events for news consumers while public administrators do not. This asymmetry of power is at the heart of the problem of media coverage of American bureaucracy. For the foreseeable future, Mercury always trumps Jupiter. The negativity of American political culture to government is permanent and is the root cause that leads to the harshness of media coverage of bureaucracy in the United States. Developments in the news industry in the first decade of the 21st century made press coverage even more negative. There are more profit-oriented media outlets, which leads to hyper-competition for audiences, less original reporting, more punditing, more spin, and an obsession with scandal and outrage.

However, with the emergence of digital and internet-based technologies for e-government and e-democracy in the 21st century, public sector agencies have, for the first time in American history, the potential of bypassing the media and reaching the citizenry directly. Also, occasional policy openings or crisis situations provide opportunities for agencies to present a countervailing picture to the citizenry through a cooperative news media. Still, public administrators have little choice but to be philosophical about this national tendency to bureaucracy bashing. Most have experienced such negative media coverage to prove it. And, with the Americanization of global media patterns, this is becoming an international tendency as well.^[19]

Medicaid Reforms in the States, Administration of

Thomas E. Yatsco

U.S. Department of Health and Human Services, Washington, District of Columbia, U.S.A.

Irene J. Barnett

Department of Political Science, Kent State University, Kent, Ohio, U.S.A.

INTRODUCTION

A program, with implementation and funding that is shared between the federal government and the states, Medicaid is the source of health insurance for over 40 million Americans who are elderly, disabled, or poor. In fact, one in seven Americans receive health insurance through Medicaid. Medicaid is administered at the federal level by the Centers for Medicare and Medicaid Services (CMS), a unit of the U.S. Department of Health and Human Services (DHHS).

Medicaid experienced dramatic change during the 1990s, especially in regard to how the federal government and states coordinate their efforts to provide health care insurance, and the next decade looks to be equally dramatic. This article reviews major trends in spending and eligibility as well as federal issues that affect states' administration of Medicaid and their policy decisions. Specifically, examined are Medicaid waivers that states use to implement health care innovation; changes in the relationship between Medicaid and managed care; developments in providing health care to needy children under the State Children's Health Insurance Program (SCHIP); issues related to Medicaid long-term care; and efforts to improve federal management and oversight of Medicaid.

Medicaid spending grew at rates in excess of 25% per year. Spending moderated in the late 1990s due to federal legal and regulatory efforts aimed at cracking down on states' use of "creative" financing mechanisms like excessive disproportionate share hospital payments, intergovernmental transfers, and provider taxes and donations. Furthermore, expenditures remained constant as enrollment remained steady due to a strong economy along with state welfare reform and fewer expansions in eligibility. Services provided to Medicaid recipients were provided at costs that remained constant due to moderate health care price inflation along with the expanded use of managed care and the increased use of home and community-based alternatives to costly institutional long-term care.^[3]

Observers predict that Medicaid expenditure growth will start escalating in the new century and will once again become a major drain on state budgets. The Congressional Budget Office predicts Medicaid spending to increase by 8 to 9% over the next several years. Factors that will likely cause a reversal of recent declines include rising prescription drug costs, increasing enrollment of the disabled who require costly long-term care, pressure from the health care industry to increase payments levels, and the growing likelihood of an economic slowdown.^[3]

TRENDS IN MEDICAID SPENDING

Spending on Medicaid's 40 million beneficiaries is projected to total over \$220 billion during federal fiscal year 2001.^[1] Medicaid expenditures are shared between the states and the federal government. Federal matching funds are provided to the states based on their per capita income. In 1998, the federal government's share of Medicaid expenditures averaged 57% across all the states.^[2]

Medicaid spending grew at an average rate of 11% between 1980 and 2000. However, Medicaid expenditure growth has been relatively modest since the mid-1990s, and spending grew by only 5% in 1998. This marked a significant change from the early 1990s, when

TRENDS IN MEDICAID ENROLLMENT

Medicaid provides care to over 40 million individuals. The majority of Medicaid beneficiaries are children, who account for 20 million beneficiaries. In fact, one in four children in the United States are covered under Medicaid. The rest of Medicaid's recipients are comprised of more than eight million non-elderly adults with children in the home, seven million disabled persons, and four million elderly adults.^[2]

Medicaid enrollment grew rapidly in the early to mid-1990s, increasing from 29 million in 1990 to nearly 42 million in 1995. However, from 1995 to 1998, enrollment actually decreased. This reversal in trend largely can be attributed to a strong economy and the effects

of welfare reform. In addition, the large eligibility expansions of the 1980s are now fully implemented by states, and fewer people are being enrolled. However, there are indications that Medicaid enrollment is increasing, due to factors such as better outreach efforts on the part of states to extend health care for uninsured children and a slowing economy.^[3]

FEDERAL WAIVERS FOR STATES

The authority of DHHS to waive Medicaid statutory and regulatory provisions is a tool that can be used to significantly transform state Medicaid programs. These waivers give states additional flexibility and enable them to test innovative service delivery options to expand health care coverage to uninsured populations. All programmatic changes must be carried out within the limits of budget neutrality, which means that the overall cost to the federal government must not exceed the amount that would have been spent in the absence of the waiver.^[4] DHHS has three types of waivers that it can grant to states to exempt them from federal statutory and regulatory requirements (all refer to sections of the Social Security Act): a section 1915(b) freedom of choice waiver; a section 1915(c) home and community-based services waiver; and a section 1115 research and demonstration waiver. A section 1115 waiver allows wide-ranging, comprehensive health care reforms, while sections 1915(b) and 1915(c) waivers are narrower in scope and only waive specific provisions of Medicaid law.^[5]

Section 1915(b) Freedom of Choice Waivers

This type of waiver allows states to waive Medicaid's requirements of statewideness, comparability of services, and beneficiary freedom of choice with respect to providers. In return, states must ensure that their waiver programs are budget neutral, meaning they must not exceed the cost of traditional fee-for-service programs. Specifically, this 2-year waiver allows states to require Medicaid beneficiaries to enroll in managed care plans; establish primary care case management programs; selectively contract with hospitals, nursing facilities, or other providers; and create tailored programs that do not operate statewide.^[6]

Section 1915(c) Home- and Community-Based Service Waivers

With this type of waiver, the federal government allows states to implement home- and community-based alternatives to institutional care, as long as these alternatives do not cost more than institutional care.

Specifically, 1915(c) waiver authority permits states to provide services, such as home health aides or nurse's aides, for the elderly, the disabled, or people with chronic illnesses, in a community setting rather than in nursing homes or hospitals. Home- and community-based services programs essentially enable beneficiaries to receive care in a cost-effective and less restrictive manner.^[6]

Section 1115 Research and Demonstration Waivers

This type of waiver gives DHHS broad authority to waive virtually all aspects of Medicaid law without congressional approval. In theory, section 1115 waivers are used to test unique approaches to program design and administration, but many states have sought to implement nearly identical demonstrations. Accordingly, some section 1115 waivers are a means to achieve general program changes outside of the legislative process, and tend to reflect the current administration's policy priorities. All section 1115 waiver programs are subject to strict budget neutrality standards.^[4]

From the perspective of states, waivers enable them to reduce federal requirements that apply to Medicaid program participation and implement delivery system changes to expand health insurance coverage to populations who otherwise would be ineligible for Medicaid coverage, or both. Some states also target benefits to special populations. The extent of states' policy innovation is varied. For example, some states have essentially restructured their entire Medicaid programs using 1115 waivers, with Oregon's Oregon Health Plan and Tennessee's TennCare being two of the more ambitious examples. Other states' waiver programs are less ambitious in scope or basically duplicate what other states have done.

Although the federal government possessed this authority for a long time, waivers, particularly section 1115 waivers, did not proliferate until the Clinton Administration. The Clinton Administration actively promoted states' use of federal waivers, and states made extensive use of these waivers during the 1990s.^[4] Currently, 28 states have 1915(b) waivers, every state has a 1915(c) waiver, and 18 states have 1115 waivers. The Bush Administration is even more active, approving hundreds of new waivers as well as renewing existing waivers. The Bush Administration's waivers are clearly targeted at giving states greater flexibility and even autonomy over their Medicaid programs. As the Bush Administration continues to redefine the parameters of state and federal jurisdictions over Medicaid policy, it is likely that the number and nature of waivers approved by DHHS will increase.

MEDICAID MANAGED CARE

The federal and state governments look to managed care as a means to reduce costs and improve quality of care by eliminating unnecessary services and relying more heavily on primary care and the coordination of care. The number of Medicaid managed care plans increased more than sixfold during the 1990s—from 2.7 million in 1991 to 17.8 million in 1999.^[7]

States use a variety of managed care arrangements, which generally fall into two models: risk-based and primary care case management. Under the risk-based model, a managed care organization (MCO) is paid a fixed monthly fee per beneficiary and assumes either partial or full risk for the delivery of health care services. Some MCOs deliver more limited services, such as only ambulatory care, while others provide a full range of health care services. About four-fifths of Medicaid managed care programs operate under risk-based contracts. The second model of managed care, fee-for-service primary care case management, is not risk-based. Under the primary care case management model, a provider is responsible for acting as a gatekeeper, who approves and monitors services provided to Medicaid beneficiaries. Gatekeepers are paid a monthly fee by states and do not assume financial risk for the provision of services. About one-fifth of Medicaid managed care enrollees receive care under the primary care case management model.

Managed care is not a new idea. In fact, states have been able to enroll their Medicaid beneficiaries in managed care programs for several years. Furthermore, states can mandate that Medicaid beneficiaries enroll in managed care programs through a section 1915(b) or 1115 waiver. The Balanced Budget Act (BBA) of 1997 gave states new authority to mandate enrollment in Medicaid managed care without a waiver by submitting to the federal government an amendment to the state's Medicaid plan. Also, the BBA eliminated the so-called "75-25 rule," thereby allowing Medicaid-only managed care plans. So far, few states have taken advantage of the new BBA authority by amending their state plans, largely because BBA-related final regulations are still not in place. As a result, most mandatory Medicaid managed care continues to be delivered through section 1915(b) and 1115 waivers.

The BBA also mandates beneficiary protections for Medicaid managed care enrollees in exchange for giving states greater flexibility to use managed care. However, the regulations detailing requirements regarding beneficiary protection, quality, and capacity are not yet implemented. These requirements will include direct access to emergency rooms under managed care arrangements, second opinions as needed, direct access to women's health services, and an adequate network of providers. The Clinton Administration issued a

version of these regulations in January 2001; however, the Bush Administration replaced these regulations with a new set of regulations that were released in August, 2001, for review. The new proposed regulations are considered more favorable to states, because they are less prescriptive and allow states more flexibility to formulate their own specific requirements.^[8] The final regulations are supposed to be in place by the spring of 2002.^[9]

There are several issues that remain unresolved concerning Medicaid managed care. For example, federal and state policy makers will have to grapple with how to attract an adequate number and mix of providers and how to ensure access and quality of care for beneficiaries enrolled in these managed care plans. Questions also exist about broader use of managed care for special populations, such as the elderly and disabled. Currently, most Medicaid managed care programs provide care for children and families who only account for about 25% of spending. Finally, using managed care to contain costs may not be the panacea it was envisioned to be, as the most expensive and chronic forms of care are, for the most part, not delivered through managed care arrangements.^[10]

MEDICAID AND CHILDREN'S HEALTH INSURANCE

In recent years, the federal government has taken steps to increase the number of insured children by encouraging states to expand the public health insurance safety net. Most significantly, the BBA of 1997 offered states \$40 billion over fiscal years 1998 to 2008 through the State Children's Health Insurance Program (SCHIP) to provide health coverage to children who did not qualify for Medicaid. The BBA allows states to choose one of three options for accessing the SCHIP funds to cover additional children: 1) create a stand-alone program that is separate from Medicaid; 2) expand Medicaid; or 3) do a combination of both. As of 2001, every state had a program in operation, providing coverage to more than three million children.^[6] Fifteen states have stand-alone SCHIP programs, 18 states have combination programs, and 23 states expanded coverage to previously uninsured children exclusively through Medicaid. The stand-alone option gives states greater flexibility and greater control over expenditures, as a state may limit annual contributions, create a waiting list, or stop enrollment once the funds it budgeted for SCHIP are exhausted.^[11]

SCHIP is a relatively new program and has grown recently, thereby fulfilling its mission of reducing the number of uninsured children. Initially, enrollment in the program and state spending were slow, but states improved outreach efforts, devoted more resources to

the program, and enrollment grew from nearly 2 million children in 1999 to over 3 million children in 2001.^[12] In addition, DHHS issued final regulations that spell out requirements states must follow in implementing SCHIP in June, 2001. These regulations include how to determine if a child is eligible, how to enroll children, how children must be screened for Medicaid, how limits are set for out-of-pocket expenses, and how states can design a SCHIP benefits package. For the most part, the new regulations give states greater flexibility to design and implement SCHIP.^[6]

LONG-TERM CARE

Medicaid continues to be the nation's long-term care safety net, paying for more than one-third of all long-term care. This amounted to \$65 billion in 1998, or 42% of total Medicaid spending. Over 70% of Medicaid long-term care is delivered in an institutional setting to elderly and disabled beneficiaries—in skilled nursing facilities and intermediate care facilities, or intermediate care facilities for the mentally retarded.^[13] Most states have a spend-down requirement that precludes adults from receiving Medicaid-financed long-term care until their personal assets are depleted to a certain state-specific level. Considering that on average nursing home care costs \$55,000 a year, most Americans deplete their own savings and assets rather quickly.^[14]

Although most long term care spending is still devoted to institutional care, states are increasing their commitment to home and community-based service alternatives. In fact, spending on home and community-based services as a portion of total Medicaid long-term care increased from 10 to 30% during the 1990s. These services, which are supposed to prevent a person from being institutionalized, include case management, homemaker, home health aide, personal care, habilitation, and respite care. However, states must seek a section 1915(c) waiver to provide home and community-based services or obtain a section 1115 waiver for more comprehensive programs involving long-term care. In addition, the availability of home and community-based services continues to vary by state.^[13]

The landscape for Medicaid long-term care is posed for change in the upcoming years, especially regarding developing alternatives to institutionalized care like home and community-based care services. Most significantly, the U.S. Supreme Court's *Olmstead v. L.C.* (1999) decision challenged federal, state, and local governments to administer their services and programs in the most integrated setting appropriate to the needs of qualified individuals with disabilities of any age. States have the option to develop a greater array of appropriate care services through section 1915(c)

home and community-based service waivers. To further expedite implementation of the *Olmstead* decision, in June, 2001, the Bush Administration directed federal agencies, including CMS, to assist states in expanding community-based services for people with disabilities. The agencies also were directed to create an interagency council to coordinate federal efforts for the disabled.^[15] These efforts are likely to have far-reaching consequences for Medicaid and may hasten the trend toward home and community-based care services as opposed to institutional care.

MEDICAID MANAGEMENT AND FEDERAL OVERSIGHT

CMS has experienced several limitations that compromise its ability to administer Medicaid effectively and to interact constructively with states. These problems are understandable to some extent, considering CMS' vast responsibilities; it administers Medicaid, Medicare, and SCHIP along with overseeing the implementation of many Health Insurance Portability and Accountability Act (HIPAA) provisions. However, these limitations have resulted in questionable oversight and major gaps between CMS' capabilities and stakeholders' expectations, leaving many state officials frustrated. Also, CMS' programs have been described as vulnerable to waste, fraud, abuse, and mismanagement.^[16]

Recently, the Bush Administration launched a "waive of reforms" designed to improve CMS' management, enhance accountability, and improve relations with states, providers, and contractors. In 2001, DHHS announced several initiatives including a name change for the agency from the Health Care Financing Administration to the Centers for Medicare and Medicaid Services (CMS); a restructuring of the agency to three centers representing each of the major program areas; assigning specific agency liaisons for each state; and establishing boards to interact with major groups of stakeholders, such as the nursing home industry. Also, CMS plans to implement regulatory reform, such as only publishing regulations once a month on the same day in order to provide predictability for states, providers, and contractors.^[17] These actions appear to be symbolic of the department leadership's serious commitment to deal with the problems that states and other observers have identified for years. It remains to be seen whether or not these reforms will actually improve CMS' management and oversight capabilities, improving federal-state relations.

CONCLUSION

Medicaid experienced tremendous change over the past decade. The proliferation of state waivers and

state health policy innovation, the expanded use of managed care, and the introduction of SCHIP are just a few of the many notable changes that occurred since 1990. Even more changes will take place in upcoming years as the Bush Administration implements its own agenda for Medicaid and federal-state relations. So far, one major theme is evident: greater autonomy for states. This change is due at least in part to the efforts of Secretary of Health and Human Services Tommy Thompson, the former Governor of Wisconsin, who brings a uniquely state-based perspective to his job and committed DHHS to enhancing state flexibility to implement federal requirements. Other trends to monitor in upcoming years include the extent to which Medicaid spending and enrollment grow; changes in the nature of federal waiver granted to states; developments in the occasionally uneasy relationship between Medicaid and managed care; how the SCHIP program matures and states use money to reduce the number of uninsured children and families; changes in the way long-term care is provided to the elderly and the disabled; and how successful the federal government is in improving its management and oversight of Medicaid.

Merit System

J. Edward Kellough

*School of Public and International Affairs, University of Georgia,
Athens, Georgia, U.S.A.*

INTRODUCTION

The term “merit system” refers to a set of rules and procedures commonly established to fill and manage positions in government that comprise the civil service. A merit system is the primary means by which the merit principle in public employment is implemented. The merit principle, in turn, refers to the idea that public employees should be selected and promoted on the basis of merit defined in terms of a demonstrated ability to perform the jobs at issue. Merit systems are contrasted most clearly with patronage systems in which government employment is achieved largely on the basis of political connections as opposed to technical qualifications. Merit systems are designed to limit the intrusion of politics into the staffing and management of the civil service.

THE CONCEPT OF MERIT SYSTEMS

Merit systems are based on three interconnected ideas that form a foundation for the structure of civil service and public sector human resources management. The first of these ideas is the belief that positions should be filled on the basis of the results of open competitive examinations designed to measure applicants’ abilities to perform job-related tasks and duties. In other words, applicants are to be screened on the basis of examinations that measure their qualifications for employment in specified positions. The examinations may be written or oral. They might also consist of an evaluation or assessment of an applicant’s education, training, and experience. Sometimes, performance exams are also used that actually require an applicant to perform selected aspects of a job, such as operating a specific piece of equipment. Mental and physical aptitude tests may also be used in the examination process.

A key assumption in the merit examination process is that the tests used are valid in the sense that they actually do measure the ability to perform on the job. Three approaches to determining examination validity are available. The first, known as criterion-based validity, is based on an assessment of the empirical relationship between observed examination scores and subsequent job performance. One variation of this

approach requires that an examination be given to a group of job applicants, that they then be hired on a random basis or that they all be hired, and finally that their examination scores be correlated with subsequent levels of performance. The examination would be considered valid if those who scored high on the exam also scored high on measures of performance on the job. Although this approach may seem like a definitive assessment of validity, it requires that employees be selected on some basis other than their scores on the initial examination, and it assumes that poor performers will be brought into the organization in order that there be sufficient variation to correlate examination scores to performance measures. An alternative variation would be to give the examination to current employees and then correlate their scores to their performance outcomes. Although this avoids some of the problems associated with the earlier system, both variations assume that performance assessments are accurate, and that there will be sufficient variation in performance outcomes for a correlation between those outcomes and examination scores to be computed. Because of these difficulties, criterion-based validity is seldom used in practice. A second approach to measuring validity is based on what is known as construct validity. Here examination scores are correlated with known psychological constructs that have been determined to be associated with superior job performance. Such constructs might include honesty, ingenuity, or integrity. This approach suffers many of the same difficulties as criterion-based validity, so it too is not frequently used. The approach that is most useful is based on idea that an examination should measure knowledge of actual job content or the ability to perform certain aspects of a job. This tactic, known as content validity, is accepted by the courts and is the basis for most validity assessments. A test designed to measure an applicant’s ability to use a word processing program, for example, would have content validity provided that the job at issue primarily required the incumbent to perform word processing.

The second idea that forms the basis for merit systems is that public employees will have relative security of tenure. More specifically, this means that members of the civil service will not be subjected to dismissal or other adverse action on the basis of political

considerations. The objective is to ensure that public employees are protected from political manipulation. As a practical matter, this protection for public employees typically takes the form of civil service rules that prohibit adverse action against employees without just cause. In the United States, for example, this limitation means that public employees will have a reasonable expectation of continued employment provided they are performing their jobs satisfactorily. That expectation, in turn, is sufficient to establish a property interest in the job for each employee covered by the rule. Once that property interest is established, provisions of the U.S. Constitution that prohibit government from denying employees their property without due process of law become applicable. The due process requirement means, at a minimum, that dismissal proceedings against public employees may not proceed without prior notice and a hearing in which employees have a chance to respond to allegations brought against them.

The third major concept underlying merit systems is the notion that public employees should behave in a politically neutral fashion. This idea is seen as a necessary complement to the protections that shield employees from direct political control. The concept suggests that public employees must serve their political superiors equally well, regardless of party affiliation. In other words, civil servants will perform their duties in a politically neutral fashion, regardless of the political affiliation of their superiors.

CONCLUSION

Because merit systems are grounded in complex sets of rules and procedures, some level of centralized oversight of these systems is necessary to ensure their integrity. Generally, this oversight is provided by a central personnel agency, such as the Office of Personnel

Management for the federal government. The function of such an agency is to formulate rules regarding merit system procedures and to supervise their implementation. The rules and procedures govern personnel actions, ranging from selection, to training, job evaluation, and compensation. They are intended to ensure fidelity with merit principles, but the restrictions they place on management are seen by some as robbing management of flexibility that could make civil service systems more efficient.

Metropolitan Governance

Ulf Zimmermann

INTRODUCTION

Metropolitan governance refers to the governing of metropolitan regions. This can be accomplished by a variety of mechanisms, ranging from a comprehensive metropolitan “government” to a variety of forms of cooperation among the numerous jurisdictions in a metropolitan area, which will be termed “governance” here. Over the period of modern metropolitan development, there has, accordingly, been a debate among scholars and practitioners (in government and business) between the respective virtues of a single unitary metropolitan government on the one hand and a multiplicity of independent, autonomous jurisdictions on the other. The unitary form is said to promise efficiencies of scale and greater equity throughout the metropolitan area. The polycentric form, as it has come to be called, is said to promise “public choice,” which affords area residents as well as government and business interests a variety of choices of how to govern themselves and regulate local land use. Both approaches will be outlined briefly below.

DEFINITIONAL PROBLEMS

Policymakers and scholars generally use the White House Office of Management and Budget’s (OMB) definition of metropolitan areas, usually referred to as “metropolitan statistical areas.” This definition specifies a county or counties with a central city or contiguous cities of 50,000 or more, plus all adjacent counties that are metropolitan in character and are economically and socially integrated with the central county as measured, respectively, by density and degree of commuting between the counties. Varying portions of MSAs have, over the years, taken on various more or less formal forms to promote interlocal cooperation on regional issues and/or to meet federal policy requirements, as illustrated by Councils of Governments (COGs) and Metropolitan Planning Organizations (MPOs). (It is worth noting that such metropolitan agencies tend to significantly trail the definitions of their MSAs; metropolitan growth steadily outdistances organizational development.^[1] The Atlanta MSA, for example, comprised 20 counties until

the latest census expanded it to 28, but the Atlanta Regional Commission, the area’s COG and MPO, represents only a 10-county area that was the MSA in 1970.)

THE MODERN METROPOLIS

While there have been metropolises since ancient times, these remained confined to little more than the scope of “walking cities” until the emergence of modern transportation technologies, beginning with horse trolleys. And though the gentry has had its villas beyond the outskirts of the city since at least Roman times, it was only over the last two centuries that technological developments made suburban dwellings available to progressively broader segments of society. Railroads made possible the first remoter suburbs for the wealthy, electric trolleys the denser closer-in ones for the “common man,” and, finally, the unconfined automobile, with its steadily increasing affordability, allowed cities and suburbs to grow in all directions. Automobiles enabled the huge residential expansion of suburbs and, importantly, these were followed by trucks, which overwhelmingly enabled the commercial and industrial “sprawl,” which gave us the complex metro areas of today.

GOVERNING IN THE METROPOLIS

The concern with governing these metropolitan areas began, not surprisingly, with their very emergence in the late 19th/early 20th centuries, as cities began to expand because of demographic pressures, an expansion, which was facilitated, indeed, encouraged by the abovementioned developments in transportation technology. Those who could afford more transportation could afford larger properties and housing farther out from the center of the city, a pattern that still characterizes metropolitan areas today. While at first a good deal of this metropolitan expansion was captured by expanding the existing city via annexation, suburbanization soon took instead the form of developers and homebuyers creating their own independent jurisdictions. This creation of multiple autonomous suburban “small republics,”^[2,3] came about, in part, because of Americans’ antiurban bias, the lower prices of land

beyond the city limits, and the highways and home mortgages created and promoted by the federal government (mobilized, in turn, by automobile, banking, construction, and a host of related lobbying groups).^[4] In addition, many states liberalized incorporation policies and made annexation more difficult for central cities. This created the polycentric metropolitan areas championed by public choice scholars.^[5]

There is, therefore, a certain aptness to the increasingly strong federal incentives for regional approaches insofar as the major problems that need to be addressed regionally can be said to have been produced by the federal government's highway and housing policies (interstates and mortgages), as noted. States, too, have taken up the cause, promoting various "smart growth" policies.

Thus, while in 1898, New York was still able to form a metropolitan government by consolidating Manhattan with five suburban counties into "Greater New York," subsequent efforts to expand and increase regional government have been stymied by suburban interests maintaining their own power and autonomy.

But by the time suburbanization reached an early crest, in the 1950s, many of these suburban authorities recognized the necessity of joint solutions for regional issues and problems, and between that recognition and the knowledge that if they, the local authorities, did not act voluntarily, a higher level of government would impose its authority on them, local leaders began to create regional conferences at which city and county officials could voluntarily negotiate certain regional policies. The first of these, which would become known as COGs, emerged among the counties around Detroit in 1954, with others following around Washington, DC and the Puget Sound in 1957. The initial ones may have been influenced by federal housing legislation, which established a regional planning assistance program in 1954; the many COGs formed in the 1960s certainly were responding to federal highway and housing legislation that mandated regional approaches.^[6]

For example, the 1959 Housing Act called for regional jurisdictions; the 1962 Federal-Aid Highway Act mandated a regional approach to transportation planning; and the 1965 Housing and Urban Development Act specified that the new department could make grants to regional councils. The 1966 Demonstration Cities and Metropolitan Development (Model Cities) Act required certain federal grant applications to be reviewed by metropolitan review agencies, as did the Intergovernmental Cooperation Act of 1968. This process was codified and strengthened by OMB's 1969 Circular A-95, which enhanced regional cooperation somewhat.^[7]

The A-95 regional review process was abolished in the 1980s, and with it even the little regional work the COGs did was further diminished. (COGs have

pursued less "political" activities like infrastructure improvements and stayed away from social program areas such as housing, health, and welfare).^[8] But new federal legislation has called for new regional goals. The Clean Air Act Amendments of 1990 placed requirements on metropolitan transportation planning. The Intermodal Surface Transportation Efficiency Act of 1991 and its successor Transportation Equity Act for the 21st Century require metropolitan areas to have a designated MPO. By imposing air quality standards and freeing up gasoline taxes for uses other than highways, this legislation in combination has fostered a certain amount of metropolitan governance by giving MPOs more power.

This has been the case in the Los Angeles area, where the Southern California Association of Governments, a COG, has taken over the transportation role of an MPO, which works together with a largely coterminous special district covering five counties, 200 cities, as well as numerous other local governments, the South Coast Air Quality Management District.^[9] A similar district, combining pollution and transportation management as well as limited land-use controls, was created around Atlanta in 1999, extending beyond the existing MPO, which had grown out of a COG, by three additional counties that fell afoul of air quality standards.^[10]

These examples do not constitute full-scale, comprehensive metropolitan government, but they have raised the metropolitanwide salience of issues that allows regional residents and their leaders to recognize that, despite the hundreds of governments and often 3000 or more square miles of such metropolitan areas, they indeed share a region and a common set of interests.^[11] And while there are areas that have opted for some form of genuine metropolitan government to address such issues, the vast majority have relied on more limited forms of metropolitan governance. Regionwide cooperation usually requires incentives from higher up, as illustrated by the Minnesota and Portland cases below and MPOs generally; local governments may work together if they perceive that they will all share losses, as in common pool resources such as air and water, but they do not see such losses coming from sprawl and are generally not willing to adopt, for example, metrowide land-use policies (as illustrated by the failure of Atlanta's metropolitan district to do this).

METROPOLITAN GOVERNMENT

The idea of a single unitary metropolitan government, which would provide all (urban) services to everyone in the metropolitan area, is one that emerged out of the progressive movement of the early 20th century, which promoted business values that claimed that metropolitan

centralization would bring benefits of economy and efficiency, thanks to its larger scale.^[12] And though research has not supported this claim, this literature's other claim, that the polycentric approach of many "small republics" exacerbates the segregation of rich and poor and of minorities, has some evidence supporting it and thus also supports the claim of metropolitan government advocates for its greater equity.^[13]

Those areas in which actual new, larger-scale governments have been formed can be viewed as having taken place in one, two, and three tiers.^[14] A one-tier system is a consolidation, which peaked with the integration of Greater New York's five boroughs in 1898 (following the previous consolidation of Manhattan and New York Borough). But most of the more recent examples have been just partially complete consolidations of a central city with its county, which tends to cover only a small proportion of the actual metropolitan area.^[15]

In some cases, these consolidations are more akin to a two-tiered system such as that in Miami-Dade (1957), known as "Metro," in which the county provides some services, while the remaining 27 cities provide others (leaving unincorporated county residents somewhat short on services). The three-tier system, which extends beyond a single county and is thus the closest to any real form of metropolitan government, is exemplified only by Minnesota's Twin Cities and Portland, Oregon.

Here neither existing cities nor counties are eliminated or merged, but a whole new third level is added, like a legislatively empowered COG or MPO, in the form of an areawide coordinating agency. The Portland Metropolitan Service District ("Metro"), for example, covers 3 counties and 24 cities, originally with responsibilities for waste disposal, zoo administration, and other services. In 1992, voters gave it a home-rule charter and expanded its authority to regional planning via land-use control as well as an affordable housing plan.^[16] This "Metro" is the only directly elected regional government in the U.S.A. The Twin Cities Metropolitan Council ("Met"), though its members are appointed by the governor, has similar powers and can levy property taxes and issue bonds, and it oversees sewers and waste management, protection of open spaces, and the development of sports facilities, and it also serves as the region's housing authority. The metro transit and airport commissions were placed under its authority. It likewise has land-use powers and, perhaps, most unusually, a tax-sharing plan among cities.^[17] The near metropolitan governments of the Twin Cities and Portland areas did not emerge out of local initiative and cooperation (any more than the Greater New York consolidation did), but were created by their respective state legislatures.

While this latter approach aspires to, and, to some extent, achieves, more regionwide equity (and perhaps efficiency), the one-tier consolidation approach tends

to give more power to suburban interests.^[18] Of course, this comes at the expense of city residents, as minority representatives have been quick to point out, which thus raises issues of representation in metropolitan areas.^[19] There is the "one-government, one-vote" side, and the "representation by population" side, with the former favoring suburbs and the latter cities. (A US District Court has ruled that the "one person, one vote" does not apply to COGs or other such voluntary organizations as they are not governments as such).^[20] This is another factor discouraging the creation of more actual metropolitan governments, as these would then come under the Supreme Court's "one person, one vote" dictum.

THE POLYCENTRIC METROPOLIS

This "tier" approach is the best shorthand for summing up the governmental side, but it obviously applies to very limited areas (counties) and cases (the Portland and Twin Cities metros). What prevails broadly across the rest of the country's metropolitan areas is what has increasingly been called "regional governance," with a focus on enhanced cooperation and collaboration among the countless "small republics." There is in American political culture a clear preference for such self-government and local autonomy, and it gained its academic legs with the "public choice" theory that emerged in the 1950s.^[21]

These "small republics" have been able to sustain themselves autonomously by a number of service arrangements like interlocal contracting. This is federalism writ small across metropolitan America: Citizens of a small city keep their autonomy by entering a contract (it is worth remembering that the concept of federalism comes from the Latin "foedus" for "compact"^[22]) with a larger city or the county for services they do not want to produce or provide themselves. The classic example of such contracting is the "Lakewood Plan." To avoid being annexed by Los Angeles, a number of suburban residents incorporated cities in the mid-50s, Lakewood the first of these, and bought services such as water and sewerage, among many others, from the county. As this illustrates, it bears repeating that in metropolitan areas real "public" choice only goes to some publics—those who can afford to choose in the suburbs—often practicing "exclusionary" zoning, and not those in the city.^[23]

One of the earliest studies of how such separate jurisdictions operate autonomously and at the same time deal cooperatively with metropolitan issues analyzed intergovernmental relations in the Quad cities in Illinois and Iowa.^[24] Here public officials and business leaders whose operations transcended local jurisdictions promoted cooperative governance in a limited

set of areas: they all share an airport in one city, a museum in another, a municipal art gallery in a third, and a hospital in a fourth. On the other hand, there is also the older “Tri-City Symphony” and a metro area minor league baseball team. The metro area business interests have promoted metropolitan government, but, of course, local officials (and residents) have shown no interest. Area residents prefer to retain their city identity, but they seem happy to identify with their metro area. Insofar as this may amount to metropolitan governance, it is limited chiefly to economic issues.

CONCLUSIONS

While metropolitan government advocates stress social equity, attempts at regional governance, as in consolidations, are more often driven by economic motives and spearheaded by area business leaders, chambers of commerce, non-profit organizations, and other such agents. As noted, business interests have thus become advocates for regional governance—they have recognized that the economic climate depends on a environmental factors such as clean air and water and “amenities” like easy commuting.^[25] Business interests have advocated metropolitan cooperation, but they have also promoted the creation of metropolitan area special purpose districts to address what they see as the primary issues (regional transportation and water districts in Georgia, for example).^[26]

Given the economic commons metropolitan areas represent,^[27] it would appear that, while more suburban governments will continue to be created, these economic pressures and other regional interests will promote increasingly cooperative governance. Many scholars see these pressures and interests leading to a “new regionalism,” in networks of business, non-profits, and governments, with positive efforts to address the environment, poverty and inequity, governmental inefficiencies, and regional competitiveness.^[28]

Metropolitan Governmental Fragmentation

David C. Nice

Department of Political Science, Washington State University, Pullman, Washington, U.S.A.

INTRODUCTION

Metropolitan governmental fragmentation refers to the tendency for metropolitan areas in the United States to have large numbers of local governments, many of which overlap with one another. The typical metropolitan area has approximately 100 local governments in it, and larger metropolitan areas tend to have even more governments, most of which have only one or at most a few responsibilities. School districts are the best-known type of special district governments, but many other types exist. In addition, there are likely to be about two dozens municipal governments and, except in smaller metropolitan areas, no general-purpose local government that covers the entire metropolitan area.

DIMENSIONS OF METROPOLITAN FRAGMENTATION

Discussions of fragmentation in metropolitan areas usually emphasize the fragmentation of local governments, which are fragmented in two major ways: geographically and functionally.^[1-7] Geographic fragmentation involves having a multiplicity of the same type of local government, each of which covers only a portion of the metropolitan area. For example, a single metropolitan area may have 20 or more city governments or 12 or more school districts. Functional fragmentation involves the same geographical area served by several different local governments, some of which have different responsibilities. The downtown area may lie within a single city government, one or more school districts, a transportation district, a park authority, a sanitation district, and so forth. All of those governments are legally independent of one another. Because many metropolitan residents live in one part of the metropolitan area but work in another part and may shop and seek recreation in still other parts of the area, many people will be affected by the decisions of several dozen different local governments on a regular basis.

Metropolitan governmental fragmentation in the modern era has another important facet as well.

Many governmental programs and services are affected by the decisions of state governments and the national government. State governments are increasingly involved in virtually all programs that were once essentially local responsibilities, and the national government is involved in a host of programs, from health care to law enforcement. In addition, private organizations are involved in the delivery of many local services, often with some type of official relationship to one or more local governments.

Metropolitan areas are fragmented in a number of non-governmental ways as well, and the non-governmental fragmentation may be related to the governmental fragmentation. One important type of non-governmental fragmentation involves the economy. Many metropolitan areas display considerable economic segregation, with wealthy families tending to cluster together in some parts of the area and poor families clustered together in other areas. Instead of a single downtown business center, business activity is likely to be dispersed across many parts of the metropolitan area. Some of those economic centers may emphasize manufacturing, while others may emphasize retail sales, and still others, services such as health care. In addition, many businesses in a given metropolitan area are part of regional, national, or even international firms, which may cause many business leaders to have primary loyalties outside the metropolitan area.

Metropolitan areas are also likely to be fragmented socially in a number of respects. Different racial groups tend to live in different areas of a given metropolis, and some ethnic groups may have their own distinct enclaves. Gated communities restrict the access of “outsiders” to some parts of the metropolitan area, and inadequate public transportation can have the same effect on poorer citizens who may not have access to cars. Social life becomes segmented, as people live in one area, shop in other areas, and seek recreation in still other areas. As a result, many interactions take place among strangers, a development that is likely to weaken social controls on behavior and lead to more demands for governmental action.

These different types of fragmentation may reinforce one another. Governmental fragmentation appears

to encourage social and economic segregation, and economic segregation appears to discourage adoption of proposals to reduce governmental fragmentation. Whether and how governmental fragmentation should be reduced or managed are matters of considerable controversy.

PERSPECTIVES ON GOVERNMENTAL FRAGMENTATION

There are at least four perspectives on governmental fragmentation in metropolitan areas: classical administrative, public choice, class conflict, and the intergovernmental perspective.^[2-11] The classical administrative perspective argues that too many local governments exist in the United States. Because of their size, most small governmental entities are unable to reap the benefits of economies of scale and, thus, waste resources due to their inability to acquire sophisticated equipment and hire experienced, well-trained personnel. Although cooperation among local governments would likely reduce the amount of wasted resources, municipalities rarely cooperate with each other unless such cooperation is mutually beneficial and the policy area is noncontroversial. Analysts taking a classic administrative perspective argue that the overlapping nature and virtual invisibility of local jurisdictional boundaries make it difficult for citizens to determine which governmental official is responsible for what.^[5,10,11] In addition, fragmentation encourages neglect of spillover effects and often produces some governments with many needs and few resources and other governments with few needs and many resources. Coping with problems encompassing the entire metropolitan area is hampered by disagreements among the many local governments.^[5]

In contrast to the classic administrative perspective, the public choice perspective views the myriad of local governments as beneficial. Public choice analysts view local governments like competitors in a free market, competing for citizens instead of purchasers. For example, in an effort to attract students, one school district may emphasize one approach to education that is in stark contrast to the approach of an adjacent school district. This competition among districts is seen as healthy and, at times, Darwinian—school districts that fail to satisfy their customers (taxpayers) will experience a loss of students and the accompanying tax revenue. However, supporters of the public choice perspective also realize that although small local governments often waste resources or lack a tax base to support a multitude of city services, large jurisdictions can also be inefficient and experience greater costs per unit. Moreover, not all types of services have the same cost-size ratio; some services can be provided cheaply

in a large jurisdiction or be provided via a service contract to a smaller jurisdiction. In fact, some argue that smaller jurisdictions may be inherently more efficient because of the increased ability to access the proper officials, provided, of course, that the identity of that official can be determined in light of the overlapping jurisdictional boundaries. In the end, public choice theorists argue that the benefits of small local governments far outweigh the problems.^[2,5,8,9,12,13]

Although separate, the class conflict perspective is related in some ways to the classical administrative and the public choice perspectives. The public choice perspective argues that local governments compete for citizens in a free marketplace and, as a result, attract the “best” taxpayer (customer). In contrast, the class conflict view of interlocal relations recognizes that not all citizens are permitted to shop for the best community. For example, some communities are able to effectively exclude people of modest means by establishing particular zoning regulations or building codes that only the wealthy could afford to comply with. Consequently, communities composed of large, expensive, single-family homes enjoy a large tax base with a low tax burden, enabling them to enjoy whatever city services they desire. Moreover, these communities continue to thrive because of their ability to attract people and businesses with ample resources and few needs. Even if residents of the inner city had at least the legal eligibility to move into the more affluent suburbs, the historical effect of previously enforceable race-restrictive covenants or realtors who steer non-Whites away from particular neighborhoods, as well as the absence of inexpensive housing, has the effect of perpetuating segregation. Therefore, families who are unable to acquire housing in the more affluent communities are forced to remain in environments where the need for services remains high and their ability to pay for those services, low. In addition, economic opportunities grow scarcer. Consequently, businesses and the more affluent are able to leave, yet the poor must remain—their problems compounded by the lack of governmental consolidation (fragmentation). In addition, when business interests cannot find a suitably cooperative local government, they often are able to create a new one. In the end, it is only the affluent whom governments seek to attract, not the poor.^[2-5,11]

Finally, the intergovernmental perspective offers a fourth view of interlocal relations, which is essentially concerned with how metropolitan areas became so fragmented and what implications fragmentation has for interlocal relations. First, fragmentation stemmed from the confluence of several factors over time. Although changes in lifestyle and the desire of the more affluent to leave the central city and locate in more spacious and personal communities were ample reasons, fragmentation largely stemmed from the state

policies regarding consolidation, annexation, and incorporation. Before the beginning of the 1900s, annexation by local governments was relatively easy; as its citizens moved out of the city, annexation followed them. However, by the 1920s and 1930s, changes in state laws contributed significantly to a reduction in annexation, much to the relief of rural residents who had long reaped the benefits of a malapportioned state legislature that effectively diluted the vote of city residents. As the cities were unable to annex land as before and keep up with the population, the cities fragmented, new municipalities became incorporated, and the fragmented metropolis began to form. In fact, research indicates that one of the primary factors that contributes to urban fragmentation is the existence of tension between states and their cities. In short, non-metropolitan environments fear the influence of large cities and, as that fear increases, so does the tension within the states and likelihood of fragmentation. This same intergovernmental perspective supports the likelihood that special districts will result when state governments increase controls on a city's financial power. In light of the foregoing, the implications of fragmentation on intergovernmental relations are multiple. The nature of fragmentation separates people and places. Instead of one consolidated, unified polity, fragmentation leads to marginalized groups, segregated by race and class. Consequently, the more fragmented, the less cohesion among groups, and the less these groups would be willing to cooperate and resolve the many interjurisdictional problems that arise. Moreover, consistent with the class conflict perspective, some problems are inherently confined within certain jurisdictions. Thus, problems confined to one particular segment or jurisdiction within a metropolitan area are less likely to be resolved by the community as a whole, and, therefore, resolution must be accomplished by higher levels of government, leading to a reduction in autonomy between the metropolis and state and federal governments.^[2,5]

REDUCING OR COPING WITH GOVERNMENTAL FRAGMENTATION

For those who believe that large numbers of local governments in a metropolitan area are harmful, there are a number of possible remedies. They include informal cooperation, service contracts, councils of government (COG), special districts, annexation and consolidation, county-based solutions, federated metropolitan government, and non-local solutions.^[2-7,10] Although various strategies have been proposed and implemented, the success of these efforts varies. For instance, attempts have been made among fragmented jurisdictions to participate in informal cooperation. Certainly

the least intrusive method, jurisdictions have cooperated to resolve mutual problems in such areas as traffic management or exchanges of information among police agencies. However, if informal agreements are ever reached, most are in noncontroversial areas and have a short shelf life, lasting only so long as particular personnel remain in key positions.^[5]

A second approach to solving the problems associated with fragmentation is service contracts. Service contracts are often attractive, enabling local governments or private individuals to purchase from another government, a private firm, or a non-profit agency such services as water, fire protection, or even trash collection. Los Angeles County is one of the nation's leaders in providing contractual services under agreements that are legally binding. Similar devices are widely used by county and city governments all over the United States. However, service contracts require mutual agreement among the parties and will only work if the community or individual is able to pay for the services. Lack of agreement is often the by-product of fragmentation, particularly when dealing with controversial issues and policies. Local officials have sometimes encountered problems, due to inadequately written contracts and inadequate contract enforcement. Adding large numbers of private contractors can slow the implementation of major policy changes and can greatly complicate the task of determining who is responsible for results.^[2,5,14]

A third strategy to overcome fragmentation-related problems is COG. COGs are essentially a local version of the United Nations. Representatives from each member community meet to iron out problems, resolve conflicts, and coordinate their activities. These relationships were fostered years earlier, when federal grant monies were made available to local COGs and necessitated cooperation. However, like the United Nations, agreement among members has proven difficult, particularly when they address controversial issues and policies.^[2,5,10]

Special Districts

Special districts represent another approach when dealing with several local governments. These districts, e.g., school and water districts, are specific governmental entities that have the ability to raise taxes, assess user fees, and sell bonds and use the revenue to finance services they provide. Many of these districts encompass several smaller local governments like municipalities and, as a result, provide some sort of coordinated effort when dealing with a particular issue and reaching binding decisions. However, although this approach is able to handle one type of fragmentation over a particular geographical location, by the

nature of its individual function and purpose, it creates a different type of fragmentation: functional fragmentation. Thus, citizens could have different governmental units responsible for water, education, and even a sports arena, and, consequently, this leads to more government, more agents, and more effort expended to ascertain their identity and hold them accountable.^[5,10]

Annexation and Consolidation

These two related approaches are of the more drastic variety. A city can expand its geographical boundaries by annexing unincorporated areas or by consolidating with other municipalities to form one consolidated government. As a result of unification, these new metropolitan governments can take advantage of economies of scale, coordinate efforts, and offer increased visibility. Because efforts to consolidate government shift decision making from several local governments to one centralized government, resistance to this approach is common. Oftentimes, attempts to consolidate or annex are limited by feasibility. Local elites fear the loss of their power and influence, residents fear dilution of their votes, and affluent areas fear an increase in taxes to remedy problems in the central cities, which may have initially contributed to the fragmentation of government in the first place.^[5,10]

County-Based Solutions

Two county-based solutions aimed at solving the problems of fragmentation concern the transfer of some responsibilities from multiple city governments to the county and a merger between the cities and counties. For example, a county may include 10 different police agencies. Under a transfer approach, the county would be responsible for law enforcement service. Economies of scale could be realized due to standardization of procedures, personnel, and equipment. The second county-based approach is even more drastic: Cities within the county consolidate as a single political unit. This has occurred in Jacksonville, Indianapolis, Philadelphia, and Louisville, as well as some other communities. As with the annexation and consolidation approach noted earlier, county-based approaches are often difficult to enact (especially when a multicity merger is proposed). Moreover, many metropolitan areas fall within two counties or more (two governmental units are certainly preferable to 20 in the minds of many reformers). Finally, the structure of county government serves as a limitation for city-county mergers. Many county governments lack sophisticated personnel systems and executive leadership and are accustomed to working with local governments in a supplemental instead of primary

capacity. This seems to be less true of some of the more populous counties, however.^[2,5,10]

Federated Metropolitan Government

As the name implies, this fragmentation reform approach is essentially a miniature federal system. One level of government handles local responsibilities, while the other level handles area-wide responsibilities. Currently, the government in place at Toronto, Canada, illustrates this approach and enables attention to local concern, while, at the same time, permitting economies of scale and consolidation of efforts across the greater metropolitan area. The primary difficulty in this approach is its acceptance. Federated metropolitan governments are rare in the United States, and when they exist, the inherent conflict about what level of government should handle what matter is commonplace, as in the Miami-Dade County Metropolitan plan. In the end, the approaches that have the greatest likelihood of overcoming fragmentation are the least likely to be adopted. This is, in large part, the result of the original conflict that created fragmentation, a hyperpluralistic approach to the creation and maintenance of local government.^[5]

Non-Local Solutions

Finally, if effective solutions to the problems associated with fragmentation are not feasible at the local level, the solution may lie at the state or national level. For instance, grants in aid to poorer jurisdictions may help resolve the inequality of needs and resources evident in the class conflict perspective. Alternatively, a higher level of government could provide the service currently provided by a multiplicity of jurisdictions, such as a state agency vested with the authority and responsibility for education (instead of individual school districts, where disparities exist on account of their location and tax revenue sources). However, even if a higher-level government agency took a leadership role in, say, education, this approach would only serve to ameliorate the current situation, because the existing districts would remain. Moreover, higher levels of government may not always be effective in targeting assistance to where it is most needed and may not be sufficiently sensitive to local needs.^[5]

FUTURE PROSPECTS

Most of the available evidence indicates that governmental fragmentation in most metropolitan areas is likely to persist for the foreseeable future. The more drastic proposals to reduce governmental fragmentation are almost always defeated in the United States,

particularly if local residents must approve the proposal. Moreover, special district governments (other than school districts) continue to proliferate, and they bring serious problems of accountability in light of their low visibility to the general public. However, special district governments, with responsibility for several area-wide services, may offer some hope for coping with metropolitan fragmentation in a politically feasible manner, especially with some encouragement from state governments.^[7] Whether that encouragement can be found on a dependable basis remains to be seen.

New developments in information technology and the global economy have significant implications for metropolitan fragmentation, although their full implications are not altogether clear at this point.^[15] New information technologies may help improve some aspects of central city life, such as coping with traffic congestion, but the same technologies may also encourage more movement to the metropolitan periphery and even beyond it. The continuing development of the global economy may further erode the attachments of businesses to particular locations and, as a result, increase the economic vulnerability of individual localities and decrease the attachment of business leaders to the communities where they reside. Fostering a sense of community and developing future generations of local political leaders may grow increasingly difficult in many communities.

CONCLUSION

It has often been said that all politics are local, although getting a clear sense of the meaning of "local" is often difficult. This is certainly the case in many large metropolitan areas where hundreds of local governments and special districts abound. Although these governmental entities were created in the interest of being more responsive to its citizenry, it has nevertheless resulted in fragmentation, overlapping jurisdictions, and reduced accountability. However, that is not to say that governmental fragmentation has been all bad. Redundancy is a common way to reduce error, particularly in light of the fact that democracy has been regarded as a form of government for

people who are not exactly sure that they are right and who may not trust public officials very much.

Microenterprise Finance and Economic Development

Douglas R. Snow

School of Public Management, Suffolk University, Boston, Massachusetts, U.S.A.

INTRODUCTION

Microenterprise finance refers to strategies designed to create or expand small businesses that are unable to attract financing from commercial sources. Non-profit microfinance institutions (MFIs) have been established by both non-governmental organizations (NGOs) and governments to channel capital to microenterprises. Funding for MFIs comes primarily from foundations, governments, the World Bank, and MFI operations. Donors hope that lending by MFIs, commonly called microcredit, will expand local economies in disadvantaged areas, increase household income of borrowers, and create a base of entrepreneurs for future development.

Strategies to increase the supply of capital to microenterprises began over 30 years ago. Realizing that centrally planned development efforts funded by international development agencies were not making the poor better off, NGOs began developing strategies to bring small loans to poor entrepreneurs in the informal sectors of developing economies. In 1973, ACCION International may have been the first NGO to use microcredit as a development strategy when it began making small loans to businesses in Brazil.^[1] Loans from MFIs, often as small as \$50, have been used to finance a wide range of income-producing activities, including produce stands, curbside repair shops, and milk and egg production. Microenterprise finance received its first big public relations boost in the early 1980s, with the widely reported successes of Grameen Bank in Bangladesh. Grameen Bank, founded by Professor Muhammad Yunus, began lending in 1976.^[2] The Grameen model, based on small peer groups who approve and guarantee each other's loans, is now copied throughout the developing world. In addition to lending, many MFIs offer business management training, savings programs, literacy, and health care programs.

Since the early 1990s, microenterprise finance has become an important strategy for economic development in Europe and the United States. Internationally, another boost came in 1995, with the creation of the Consultative Group to Assist the Poorest (CGAP).^[3] Twenty-nine donors—development agencies of industrialized nations, multilateral development agencies, and private foundations—formed the new organization (see Table 1). In 1997, a Washington, DC, conference attracted 2900 people from 137 countries. The conference, the Microcredit Summit, set a goal

to reach 100 million of the world's poor by 2005. The Microcredit Summit Campaign emerged from the conference as an organization that collects data on MFIs, tracks progress toward reaching the campaign's goals, and promotes best practices research.^[4]

Microenterprise Finance Defined

Strategies for financing microenterprises are commonly called *microcredit*, a generic term for the diverse strategies employed to bring capital to microenterprises. Other terms in common use are *microlending* and *microfinance*. All have one thing in common, however: loans are made to entrepreneurs who are otherwise unable to access commercial banking services. The growth of microcredit as a development strategy has created a broadening of definitions. In developing countries, microcredit borrowers are generally poor women living in urban or rural areas with very small enterprises. In recent years, microcredit programs have expanded to former newly independent countries of Eastern Europe and to areas of poverty in industrialized countries. Microcredit is now a common economic development strategy in urban enterprise zones in the United States. Microcredit programs now serve diverse clienteles and enterprises throughout the world.

One of the most comprehensive definitions of a microenterprise comes from the Organization for Economic Cooperation and Development (OECD). In a 1996 report, OECD defined a microenterprise as

A sole proprietorship or family business with fewer than 10 employees (most often owner-operated); and requiring relatively small amounts of capital or credit financing (less than US\$25,000). In addition, microenterprises include part-time or self-employment activities to supplement family income.^[5]

Today, microcredit clearly involves more than just the very poor.

TYPICAL MICROCREDIT STRATEGIES

Microcredit programs are sponsored by a diverse array of institutions. Large NGOs franchise local programs that function independently using a standardized methodology. In the United States, ACCION International's

franchises partner with local non-profit and government organizations such as the Small Business Administration and the Service Corps of Retired Executives.^[6] In developing countries, microcredit programs are operated by governments (using funds from bilateral development agencies such as USAID) and by NGOs. Sometimes the microcredit programs are extensions of existing credit unions or village associations.

The lending methodology of MFIs varies, but the most popular, and the one most familiar to casual microcredit observers, is the group-lending model popularized by Grameen Bank. The group model is designed to reduce credit risk. Because the poor have little or no experience with formal credit, they lack credit history. Even with credit history, their poverty would deny them access to commercial credit. A “typical” program involves a small group of women (six or seven) formed to vet business plans and guarantee the credit of other group members. When a loan is secured, the borrower makes payments at weekly meetings. If the member defaults, all other members lose access to credit. Because of the risk of losing credit, members are careful to only approve good business plans. Peer pressure assures repayment. Repayment rates are high, approaching 100% in some programs. The loans are very small by the standards of industrialized countries, in the neighborhood of \$100. The term of the loan is usually short and measured in weeks. Interest is high. Monthly rates of 3% to 4% are not uncommon.^a

In many African countries, a tradition of savings and rotating credit predates the colonial experience. Some NGOs have been able to use rotating savings and credit associations (ROSCAs) as a tool to implement microcredit programs. In ROSCAs, women bring savings to each meeting. The women take turns

withdrawing savings from the ROSCA and repay their loans at future meetings. Microcredit programs take advantage of existing ROSCA groups to infuse new capital into an area. Many microcredit programs require their members to save. In a peer group model, savings are brought to each meeting and are sometimes deposited with a local bank. In lieu of savings, some programs require members to bring a small amount each week to insure their loans, removing some of the risk of the group model. Some programs include training and education with lending. Members participate in training in advance of receiving loans. Other social services may also be offered.^[7]

Grameen Bank “replications” are not always successful. The peer group model is vulnerable. Default by one member may create a domino effect as other members realize that their access to credit is about to end. Without future access to credit, why repay the loan? It is also possible for group members to cheat by repaying loans in one microcredit program with loans from another source, possibly family members, another MFI, or local loan sharks. The inevitable day of reckoning brings default.^b

In the United States, the peer group lending model is used much less than it is in developing countries. Microfinance institutions in the United States that do use the peer group methodology report much lower average loan sizes than those MFIs that do not, \$1802 and \$10,631, respectively.^[9]

SIZE OF THE MICROENTERPRISE INDUSTRY

Documenting the size of the microcredit industry is a daunting task. But by any count, microcredit is a large industry. The Microcredit Summit Campaign (MSC) reports that between 1995 and 2000, over 1500 MFIs reached 30.7 million clients. Most of the MFI clients

^aThis is a composite example based on the group lending methodologies of The Foundation for International Community Assistance (FINCA), <http://villagebanking.org> (accessed March 2002) and ACCION International, <http://accion.org> (accessed March 2002).

^bFor a discussion of defaults, see Ref.^[8].

reported to MSC are in Asia (Table 2). The largest MFI reported by the campaign is Grameen Bank, with over 2.3 million clients as of calendar year 2000.^[4]

In the United States, the *1999 Directory of Microenterprise Programs* reports 341 microcredit programs in 46 states and the District of Columbia. These programs have served over 250,000 clients and dispensed \$160 million in loans since start up.^[10] The U.S. Small Business Administration has added microcredit to its small business programs. Community Development Agencies have broadened their activities to include microcredit. Many banks either provide direct funding or indirect support through lines of credit or other banking services. Microcredit programs operate in urban enterprise zones as part of both state and federal urban development strategies.^[11] The Charles Stewart Mott and Ford Foundations, as well as the Aspen Institute, fund, evaluate, and publicize microcredit research and/or programs.

MICROCREDIT AS PUBLIC POLICY

Microcredit has its origins outside the control of governments and large international development institutions such as the World Bank, United National Development Program, and United States Agency for International Development. During the 1990s, microcredit grew into a popular economic development strategy in developing countries. This was largely due to the popular opinion that the economic development projects begun in the 1960s had failed. Industrialized nations and international financial institutions now accept microcredit as an important element of development policy. Success has been so complete that microcredit is also an accepted strategy for economic development in OECD countries.

Microcredit strategies are heavily debated among scholars and practitioners. The entry of large multilateral institutions has contributed to the vast microcredit literature. Schools of thought have formed around the

proper role of MFIs. Should MFIs become self-sustaining institutions only, recovering all their costs through fees and interest, or should they provide social intermediation, acting as more comprehensive social welfare institutions? The reality is that MFIs do not neatly fall into either camp. Nevertheless, the arguments have important public policy implications. The very standard upon which MFIs will be evaluated depends on expectations of what the MFI is supposed to achieve.^c

The argument for self-sustaining MFIs is grounded in the fear that cheap credit will distort local markets, leave the poor burdened with debt that they cannot pay, and ultimately lead to failure of MFIs when donor subsidies turn to other development strategies. The poor have shown that they can save money and repay loans with high interest rates. Microfinance institutions that recover all their costs through fees and interest become self-sustaining and part of the local financial infrastructure. One highly publicized success is that of BancoSol, which began as a subsidized MFI in Bolivia and later became a self-sustaining bank in 1992. Self-sustaining MFIs should, according to this school of thought, graduate to commercial banks. In developing countries, especially, this deepens the financial infrastructure and brings more economic activity into the formal economy. Building sustainable institutions will benefit the poor in the long run and avoid the disheartening effects of “flash in the pan” projects.

Advocates of social intermediation argue that microcredit will be judged on its ability to improve the condition of the poor. For this reason, many MFIs offer far more than credit. Training in writing business plans and management is common. But in developing countries, public health and education may supplement services offered by MFIs. Those who advocate social intermediation approaches to microcredit fear that true self-sustaining MFIs may have to serve a population that is better off in the first place, leading to goal displacement. Reaching the very poor and yet recovering all costs through fees and interest are incompatible.

Debate over the appropriate role for microcredit will continue. But while the debate has raged, microcredit has continued to grow and diversify. An important trend is the linkage of microcredit programs with both not-for-profit and for-profit organizations. Commercial banks offer savings to microcredit borrowers and letters of credit to MFIs. An MFI in the United States may have relationships with commercial banks, non-profit organizations that provide management training, and governmental agencies.^[13] Through linkages, MFIs become important components of urban and rural economic development strategies, not just stand-alone operations. Looking at microcredit from

Table 2 Microcredit clients reported by Microcredit Summit Campaign by region

Region	Clients reported in 2000	Percentage of total
Africa	5,180,881	16.9
Asia	23,576,938	76.8
Latin America and Caribbean	1,672,541	5.5

^cFor a complete discussion of the microcredit debate, see Ref.^[12].

this point of view, sustainability may be better viewed from the point of view of an overall economic development strategy, not just the MFI itself.

Microcredit is generally perceived as a “teach a person to fish,” rather than a “give a person a fish,” development strategy. Proponents believe that providing the means for the poor to own businesses and increase their incomes will lead to strong and prosperous communities. However, evaluation has tended to focus on the design of microcredit programs, so-called “best practices,” as opposed to actual outcomes for program participants. Fortunately, evaluations of microcredit programs are maturing. Research funding by the World Bank, USAID, and philanthropic foundations is likely to produce better research designs. A promising evaluation approach involves measuring the overall effects of microcredit borrowing on household wealth and income. Although these evaluations are needed, they are not without their challenges. Microcredit participants are self-selected, so true comparison groups cannot be found. Separating increases in wealth and income due to microcredit from other factors is difficult.^d

CONCLUSION

Microcredit has become a well-accepted economic development strategy. Once targeted at the very poor in developing countries, microcredit has become an important tool in the United States and other industrialized countries. The basic premise of microcredit has not changed: given access to credit and training, the poor are able to develop businesses, increase their incomes, and expand the economic base of their communities. However, the expansion of microcredit as an economic development strategy has led to diversification in the field. The very poor are no longer the only target of microcredit programs. This has led to considerable debate over the proper role of microcredit in economic development.

Research on microcredit has become more sophisticated with the increased interest of large development institutions and foundations. In an area once dominated by NGOs, governments are now playing a larger role. Evaluation of microcredit programs must now take into account multiple goals advocated by a complex set of political actors.

ACKNOWLEDGMENTS

Past collaborations with Professors Terry Buss and Gary Woller contributed greatly to the author's knowledge on the subject of microcredit.

Middle East and Regulation

Ori Arbel-Ganz

Department of Political Science, Bar-Ilan University, Ramat-Gan, Israel

INTRODUCTION

There is almost no doubt that regulation has become the most prominent expression of those involved in democracy and global capitalism. Starting in the United Kingdom during the middle of the 18th century and continuing in the United States, regulation policy has spread during the last decades to Australia, New Zealand, Latin America, Western and Eastern Europe, Scandinavian countries, the Far East, and also to the Middle East.

Complex questions arise at the heart of this topic, such as the power of regulators, their institutional arrangements, and discretion and doctrine, while the political agenda also criticizes the state becoming a *regulatory state*.

Theoretical Framework

Within the public policy context, regulation refers to any action taken by the government to introduce order into the activities undertaken within its sphere of responsibility and authority. From a broader perspective, regulation pertains to the government laws and instructions that order the exchange of goods and services.^[1] Others have narrowed the definition by focusing on the executive branch, to a process or activity in which an executive government branch sanctions, prevents, or prohibits the performance of specific individual, institutional, or organizational actions or behavior, and do so under a long-term administrative regime.^[2] From a functional point of view, some have argued that the factor common to all definitions of regulation lies in their inclusion of three distinctive factors: 1) *determination of norms*—formal decisions that set standards based on professional skills, and that prescribe or prohibit specific behavior; 2) *control*—the outcome of application of standards or directives, meaning limitation of the number of actors and/or the arena for their permitted freedom of action; and 3) *monitoring*—the enforcement of standards and directives.^[3] Although regulatory agencies vary considerably with respect to the internal balance between these three characteristics, there is consensus for the priority of determination over control and monitoring. The main task of all regulatory agencies is to

structure specific domains, which they do by initially determining what norms are required and only afterwards by enforcing norms and creating subsidiary norms.

Others view the setting of norms as *ex ante* crisis prevention and enforcement of norms as *ex post* crisis solution.^[4] Some scholars differentiate between regulation's cautionary (red light) functions and its authorization (green light) functions. That is, the exercise of regulation narrows an individual's (or organization's) freedom; by doing so it sustains the freedom available to the public or other organizations.^[5,6] Also some point to three layers of regulation: 1) targeted rules; 2) all modes of state intervention in the economy; and 3) all mechanisms of social control by whosoever exercised.^[3,6] While regulation policy must be executed by rule, and since whatever regulator does normatively must be referred to any value, we may define it as an *authoritative arrangement of exchange between society's values*.

Regulation—normative aspects

In democratic societies, citizens waive some of their rights by delegating them to the government in order to fulfill their rights. However, the norms maintained and the rights awarded the individual are many; hence, the norms activated by government agencies to protect citizens frequently conflict with one another, especially on economic exchanges. Therefore, the essence of regulatory policy was originally involved in correction of market failures. Market failures represent those situations where the equilibrium between supply and demand does not maximize a society's production potential.^[7,8] As a result, the freedom to maintain exchange relations between the individual and the society is not sustained,^[9] as revealed in the presence of monopolies (or cartels), information asymmetric, externalities, public goods, and circumscribed property rights and ownerships.^[10] From this perspective, regulation is a series of competitive rules meant to overcome or at least minimize the negative effects of market failures or, alternatively, to prevent their appearance so that the market will continue to subsist as a leading society mechanism.

Market failures will be controlled by economic regulation that monitors prices of goods and services,

controls the amount of goods and services available, and determines entry and/or exit barriers and/or incentives to specific industries.^[11] Some scholars have made distinctions within theories of economic regulation between 1) *self-regulation*—meaning the determination of norms and rules by the firms themselves; 2) *regulation of competition*—referring to a policy of maintaining branch stability by industry regulation; and 3) *metaregulation*—the integrated enforcement by regulatory agencies of the regulatory regime's competitive laws through industry as well as general market self-regulation.^[8]

Nevertheless, regulation as a policy tool was also introduced to improve social well-being, that is, to increase or more equitably distribute social resources.^[12] Stated differently, regulation that does not promote competition for this purpose will not further individual freedom, but it will directly provide values and rights that the market did not provide, provided partially, provided inadequately, or conversely prevented the individual from acquiring those values and rights.^[3] Thus, social regulation focuses primarily on issues of environmental quality, health, and education as well as the safety of products and services. One of the main characteristics of these domains is the inability to accurately price their respective externalities, since the supply-and-demand equilibrium considers only in part, if at all, changes in the equilibrium of secondary markets resulting from the externalities originating in the primary market. Whereas, economic regulation evolved to support competition as a social mechanism, social regulation controls the negative impact of competition in domains lacking markets.^[13]

Some scholars also differentiate between *paternalistic* regulation, which focuses on domains in which individuals tend not to take responsibility for their actions,^[3] and *procedural* regulation, which focuses on administrative and production processes operating in the private sector for the purpose of the reducing consumer costs and preserving public trust in the economic systems active in the market.^[14]

Regulation—positivistic aspects

According to *pluralist theory* and its discussion of interest groups, regulatory policy reflects the outcome of reciprocities between social groups and government entities. The regulatory-making process therefore indicates that an interest group managed to best exploit its power vis-à-vis that of the governing agency at any given place or time in order to further its own interest.^[15]

The *institutional approach* views regulation as the outcome of an interinstitutional system of governing authorities. It focuses on the reciprocities between the

public agencies, laws, procedures, and rules that invite exchange. The same perspective is applied internally with respect to the organization's rules, culture, and policy outputs. Therefore, if the institutional systems found in different states themselves vary, the regulatory policies formulated when confronting the same market failures will also vary.^[16]

From the *private interest approach*, which focuses on the individual decision maker, the individual regulator employs regulation as a means to further personal interests under the umbrella of public interests or a particular pressure group.^[17] Members of this school view regulators as none other than *captured* by the firms to be regulated. It is therefore quite understandable that in anticipation of employment in a senior position in one of those firms, the regulator will translate his expectations into the easing of restrictions for the regulated firms and the exchange of his power into some form of future reward.^[18]

According to the *ideological approach*, regulation reflects philosophical conception of reciprocities maintained between society and the state.^[12,19] Policy makers essentially formulate regulatory policy prior to their election to senior office, and their personal worldview regarding the limits of the state when intervening into the market is what dictates their satisfaction with regulatory policy in general.

According to the *diffusion approach*, regulation spreads through scholars' networks, experts, bureaucrats, social networks, and via personal until its adopted by states, authorities, markets, and institutional procedures. As with all other diffusions, so did regulation appear over time as an "S" diagram: at the beginning, only a few players had adopted it, and by the second and third stages, most countries had implemented it as main practice of government and society.^[20]

Regulation—historical review

The perception of regulation as a distinct policy exhibiting unique characteristics was born in Britain in the middle of the 19th century. The federal government in the United States began to deal with regulatory profit policy in the last decade of the same century. Most democratic countries in Western Europe began to contend with regulation especially during the second-half of the 20th century.^[21] The Scandinavian democracies undertook a similar journey during the 1970s, but have especially contended with regulation policy since the 1980s.^[22] In Canada, the government instituted a regulatory policy beginning in the second-half of the 20th century that was constructed of a complex set of regulatory agencies,^[23] as did many South American countries^[24–26] and Australia.^[27] The Japanese began to mull over the American approach to regulation in the 1960s, with an operative version

in place since the 1980s.^[28] Creation of the European Union also induced the establishment of regulatory agencies.^[29]

However, the institutional development of regulatory policy was different in each country. This is due, among other things, to the divergence in regime position and economic ideology within each nation. For instance, in the United Kingdom regulatory departments were first established in government ministries and subordinated to the full and direct power of the respective minister. Later on, regulatory authorities were established next to government ministries with the subordination to the mandated minister varying from one ministry to another and from one country to another. In still other countries, such as the United States, regulatory authorities were set up external to the government and endowed with almost complete independence from the elected echelons with respect to policy formation.

Beginning in the 1980s, a trend stressing reform began to gain currency regarding the place and significance of regulatory policy in several democratic countries, even in those that were slowly adopting democracy as a doctrine. This trend was expressed, for example, by the transformation of U.K. ministerial authorities into “independent” agencies, usually parallel to the unification of several regulatory agencies under an inclusive superagency such as the Financial Services Authority (FSA), Office of Communications (OFCOM), Office of Gas and Electricity Markets (OFGEM), all in the United Kingdom. Reform aimed at “unification” has also been initiated in Norway, Denmark, and Sweden for more than a decade, systematically and steadily although slowly, and primarily in the sphere of financial markets. Such superagencies are also to be found in Austria, Bermuda, the Cayman Islands, Estonia, Germany, Gibraltar, Hungary, Iceland, Ireland, Japan, Latvia, Moldova, Malta, Nicaragua, Singapore, and even South Korea.^[30] Changes and reassessment of procedures can also be observed in Jamaica, Bolivia, Chile, Peru, Mexico, Argentina, and Venezuela.^[25]

Regulation in the Middle East countries

From a historical and primarily cultural perspective, the Middle East is a subregion of Africa and Asia. Some cartographers include countries from southwest Asia together with Egypt, while others also include North Africa and Central Asia. According to the International Air Transport Association (IATA), the standard organization of the airline industry, the Middle East encompasses Bahrain, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Palestinian Territory, Oman, Qatar, Saudi Arabia, Sudan, Syrian Arab Republic, United Arab Emirates, and Yemen.

However, it is delineated, the Middle East has always been considered by the western world to be a predominantly Islamic Arabic community. Yet, within the Middle East there are several cultures and particularly different ethnic groups, such as Arabs, Armenians, Assyrians, Azeris, Berbers, Chaldeans, Druze, Greeks, Jews, Kurds, Maronites, Persians, and Turks.

A frequent description refers the Middle Eastern countries as *economies in transition*,^[31] moving from heavily state-dominated and closed economies to systems based on private initiative, market forces, and greater integration with the rest of the world. Most of the countries in the region still have limited and declining economic relations with western countries, large public sectors, and low levels of private investments, however, globalization, technology, and free markets do affect structural and institutional reforms. While social regulation may be implemented as part of a socialist doctrine, economic regulation can only take place parallel to the development of free markets. In Saudi Arabia, for example, regulation of the telecommunications industry was established in 2002 in order “to ensure the provision of high-quality universal telecommunications services at affordable prices.”^[32] Since the last quarter of 2004, the Communications and Information Technology Commission (CITC) has consistently opened telecommunications markets for competition and has liberalized mobile telephone use. In addition, the structure of the regulatory authority was following western countries’ reforms: it is governed by a Board of Directors who are responsible for policy formation, budgetary approval, and administrative reviews. The Minister of Communications and Information Technology who moderates between the government macropolicy and CITC regulations chairs the board. Below the chairperson, there are seven more directors; one serves as the chairperson deputy and as the governor of the commission (CEO). The same type of development happened in Bahrain, when the Telecommunication Regulatory Authority (TRA) was established in 2002 in order to protect “the interests of subscribers and users, and [promote] effective and fair competition among established and new licensed operators.”^[33] The TRA is governed by a board of five directors who serve independently from the cabinet of ministers. In the Hashemite Kingdom of Jordan, a Telecommunication Regulatory Commission (TRC) was established in 1995 and governed by a board of five full-time commissioners, one of whom served as Chairperson and CEO. The Jordanian TRC is a quasi-independent regulator that is directly accountable to the Prime Minister but subordinate only to the general policy of the government.

The inherent dependency between social and economic affairs can be understood by considering the Egyptian reform of environment regulation. As had

happened dozens of years earlier in the United States, Canada, Australia, Europe, Latin America, and also Japan. Egypt established an Environmental Affairs Agency in 1997 in order to prevent and reduce negative externalities caused by air and water pollution, urban sprawl over natural resources, ozone effects, and other detrimental conditions. Since the 20th century has proven that environmental hazards are no longer a state issue but an issue for all humankind, all governments are expected to take part in the global and international efforts to reduce the risks. Egypt, as one of the leading countries of the Arab modern world, has adopted the regulatory doctrine of the western world by establishing an environmental protection agency.

Governments in the Middle East have also adopted finance regulation, especially through monetary police and central banks. Bahrain, for instance, established the Bahrain Monetary Agency in 2002 in addition to the Sharia Supervisory Board. While the former regulates banking and finance within capital market standards, the latter regulates banking and finance under Muslim orthodox laws and tradition.^[34] Saudi Arabia also instituted finance regulation in 2003 with the establishment of the Saudi Arabia Monetary Agency. Similarly, Kuwait established an independent central bank in 2003 in order to “secure stability of the Kuwaiti currency and its free convertibility into foreign currencies; [and] to direct credit policy in such manner as to assist the social and economic progress and the growth of national income.”^[35] The Kingdom of Jordan transferred regulatory power to the central bank in 2000, and Lebanon followed in 2004.^[36]

The state of Israel is the only non-Islamic or Christian state in the Middle East. Regulatory policy has been designed and implemented in Israel since its infancy in the early 1950s. Yet, regulation was especially developed in the 1980s as part of privatization policy, and even more so after the mid-1990s. Most markets and companies are regulated by statutory regulators, which are subordinate directly to the executive government. Other regulators serve as quasi-independent and some agencies earned total independence from government. Today, the state of Israel regulates banks through the Central Bank; the securities are regulated by the Israel Securities Authority; the commercial TV and radio broadcasting are regulated by Board of Directors; electricity is regulated by the Public Utility Authority—Electricity; and higher education and academic activities are regulated by the Israeli Council of Higher Education. Parallel to sectoral regulation, the Israel Antitrust Authority is responsible for the competitive regulation of all markets. Administrative departments that are structured as part of the ministries and subordinate to the ministers mainly control social regulation.^[37]

CONCLUSION

Regulation has become the most common and well-known policy tool and characteristic of modern states during the last decade. Usually its development was, and still is, a part of markets liberalization and globalized economies. Since its very beginning over a 150 years ago and until recent years, regulation seemed to be a unique reflection of the western world and modern democracies. Yet, the last 15 years prove that developing countries as well can adopt the same doctrines and institutional measures of regulation. One fascinating example is the development of regulation policy in the Middle Eastern countries, particularly considering the fact that the majority are Muslim states by law. Within these countries that are in transition, it will be exceptionally interesting to view how economic and social regulation will be designed and implemented within their politics during the next decade. As part of globalization and international trade relations all over the world, the age of regulatory governance will not skip over the Middle Eastern modernization and will likely contribute to its growth.

Middle East: Corruption

Doron Navot

Political Science Department, Hebrew University, Jerusalem, Israel

INTRODUCTION

Corruption is a complicated and multifaceted phenomenon and it is a contested concept. The meaning of corruption is theory laden and the various uses of the term are influenced by political interests and developments. By its very nature, corruption is concealed, and part of what makes a behavior corrupt is the intention of the public officer to promote a private gain. As a result, it is hard to measure corruption directly or indirectly. When dealing with corruption in the Middle East, those challenges make the mission of exploring the phenomenon scientifically, almost impractical. Raw data on the subject hardly exists, and empirical researches of corruption in specific countries in the region are not to be found. Indeed, there are indications for a serious predicament of corruption, but very few substantive materials that support any unequivocal claim.

The effects of corruption, or so-called corruption, should also be considered when dealing with corruption in the Middle East. There are indications that in the recent years public opinion within the Middle East countries is bothered by the lack of democratic features and the existence of corruption. In addition, transnational organizations like the World Bank and OECD work to curb corruption in the region.

This article continues as follows. The first part presents the concept of corruption. The second part provides empirical findings and estimations of the range of corruption in the Middle East. It also briefly deals with methodological problems and presents possible theoretical explanations for the existence of political corruption in the area. The potential role that corruption and anticorruption activities will play in the future of the current regimes will be described in the last part.

THE CONCEPT OF CORRUPTION

Scholars agree that a clear-cut definition of corruption is not to be found. While it is acceptable to define the phenomenon as the misuse of public office for private gain, the precise meaning of the essentials that compose the definition, and the applicability to real cases and events, are far from being straightforward.^[1] In order to use the concept for public policy, we should

bear in mind that while corruption should be regarded as misbehavior or abusive activity, there are different perspectives of what is proper and what is not.^[2]

There are at least two types of corruption in politics, or two types of corrupting politics: the inappropriate struggle for power and exercising power in order to get illegitimate personal gains. Another distinction is between corruption of an appointed civil servant and corruption of an elected one. Similarly we can distinguish between political corruption per se, which is related to political processes, and bureaucratic corruption, which is related to the public.^a Finally, we should consider the principal divergent between political corruption—which is often hidden—and political scandals or “corruption affairs”—which by definition occur in public. Behind accusations of corruption, corruption does not necessarily exist. On the other hand, the fact that we do not hear about corruption does not necessarily mean that it is not present.

CORRUPTION IN THE MIDDLE EAST

What do we know about corruption in the Middle East? We have three different indicators, which point toward a problem of corruption: 1) Corruption Perceptions Index (CPI) that were made for Transparency International (TI) and published by TI; 2) “impressionistic evidence;” and 3) structural analysis. Each one of these measures does not observe the phenomenon directly, and separately each one is not a credible measure of corruption. Yet, the fact that they

^aArnold Heidenheimer suggested distinguishing between three types of definitions: public service-centered definitions; economic-centered definitions; and public opinion definitions. See: Heidenheimer, A.J., Ed.; *Political Corruption—Readings in Comparative Analysis*; Holt, Rinehart and Winston, Inc., 1970. After 2 years, James Scott offered a classical typology of definitions. Scott distinguished between three types: legal-centered definitions; public interest-centered definitions; and public opinion-centered definitions. Scott, J. *Comparative Public Corruption*; Prentice-Hall Inc.: New-Jersey and Englewood Cliffs, 1972. However, in the 1990s, scholars like Michael Johnston and Mark Philp showed that all the definitions are based on the same vague criterion, which are the sound condition of politics. For elaboration, see: Johnston, M. The search for definition: the vitality of politics and the issue of corruption. *Int. Social Sci. J.* **1996**, *149*, 321–335. Philp, M. Defining political corruption. *Political Studies* **1997**, *45* (3), 436–462.

all point to the same direction, provides us with reasons to believe that corruption is pervasive.

The opinion surveys are the most commonly used tools to assess corruption.^[3]

The data in Table 1 shows that Israel is perceived as the least corrupt country, with Iraq in the worst position. This is not surprising, if we take into account the fact that Israel is the only state with free and fair periodic elections and an independent judiciary system, and that it is identified as the single democracy in the region. Iraq has been in a chaotic situation for several years, and to perceive this country as corrupt under these circumstances is natural reaction. It is also clear that the range of the ranking is wide, and that the perceptions of corruption among the states varied. Jordan is traditionally in the middle low ranking, with Egypt just behind. Countries closer to western influence are perceived as least corrupt.

But the index has several limitations: 1) there is a difference between perceived corruption and experience of corruption^[4]; 2) the CPI is interested in the business environment, and less with issues like political appointments, nepotism, and the relative strength of the state vis-à-vis the business community^[3]; 3) not all the countries are included in the CPI, and there are differences in the number of the countries participating in the survey over the years; and 4) when it comes to surveys in the region, the samples on which the surveys are based upon are relatively quite small.

There are plenty of impressionist evidences that the regimes in the area are corrupt, some are a bit hasty. A good example is the identification of Arafat's regime with corruption. The founding father of the Palestinian authority kept millions of dollars that he received for the Palestinian people in his private accounts, and frequently used the money to buy political support (bribing opponents and keeping allies "loyal"). However, Arafat did not use the money for (non-political) personal gain.^[5] His behavior fits well to

what was termed by Thompson as mediated corruption^[6] or institutional corruption,^[7] but not with conventional corruption. In other words, even if Arafat's behavior is a sort of corruption, it should be distinguished from briberies, embezzlement, theft, bid-rigging, kickbacks, fraud in contract performance, and product substitutions. Another feature that creates the impression that regimes in the area are corrupt is the fact that most of the elections taking place in countries like Iraq or Egypt end up with the victory of the current ruler, who usually wins 99.8% of the votes. Such unreasonable results are due to undemocratic elections and their mere existence presents those regimes as corrupt. In conclusion, impressionistic evidence supports the data provided by the CPI. However, this source of data is damaged by biased judgments and suffers from inaccuracy.

Probably the best type of data about corruption in the Middle East is the existence of factors that contribute to corruption, or associated with it.^[8] Arab countries are characterized by a centralized executive, inadequate institutional checks and balances, and lack of institutional mechanisms of political participation. There are no basic mechanisms for accountability such as free and fair elections. Public figures are not answerable to the people, there is little public transparency, and a lack of available information on what government does. In addition, most of the countries in the region have weak civil societies.^[9,10] Another indirect indication for corruption is poor governmental performance of most of the countries in the region.^[11] Poor governance might be a cause for corruption or the result of it (or both). One way or another, it is another indication for the pervasiveness of corruption.

The effects of corruption on Middle Eastern countries are very negative: 1) Corrupt politicians and corrupt states that allegedly exist in the Middle East cause injustice and suffer among the people^[12]; 2) political corruption is destructive to trust and institutional

Table 1 Corruption Perception Index—countries in the Middle East: 1996–2005

Year	Egypt	Iran	Iraq	Israel	Jordan	Kuwait	Lebanon	Palestine	Saudi Arabia	Syria
1996 (54)	41	—	—	14	30	—	—	—	—	—
1997 (52)	—	—	—	15	—	—	—	—	—	—
1998 (85)	66	—	—	19	38	—	—	—	—	—
1999 (99)	63	—	—	20	41	—	—	—	—	—
2000 (89)	63	—	—	22	39	—	—	—	—	—
2001 (91)	54	—	—	16	37	—	—	—	—	—
2002 (102)	62	—	—	18	40	—	—	—	—	—
2003 (133)	70	78	113	21	43	35	78	78	46	66
2004 (145)	77	87	129	26	37	44	97	108	71	71
2005 (158)	70	88	137	28	37	45	83	107	70	70

trust,^[13] which are both necessary conditions for any political or collective action; and 3) it impoverishes economies, undermining the rule of law and facilitates other threats such as terrorism.^[14] In conclusion, while corruption might have positive effect in industrialized countries, in the short run, when it comes to the pervasiveness it is allegedly in the Middle East, corruption is disastrous.^[15]

The simplest and straightforward explanation for corruption in most of the countries in the area is the fact that their regimes are not liberal or citizen oriented; they are authoritarian with exclusive tendencies and there is a shortage of any democratic experiences or traditions. If we recall Acton's famous dictum "power tends to corrupt and absolute power corrupts absolutely," or consider simple and logical economic models that analyze the causality between discretionary and monopoly power without accountability and levels of corruption,^[16] we realize that corruption in the area is only to be expected. In other words, there are many reasons for corruption to exist—and only few not to. In conclusion, there are several indications that corruption is pervasive in the region, and none that tells the opposite. Israel is the exception, probably because of its different political system. The primary reason for the predicament of corruption can be termed as nondemocratic structures.

CONCLUSION

Since the fall of the Soviet Union in 1989, globalization and democratization movements have increased all over the world. The concern for corruption in the Middle East has grown accordingly. The phenomenon is regarded as a serious problem and a major impediment to the development of countries like Jordan, Egypt, and Lebanon. The failure to address the challenges of curbing corruption puts governments under the dangers of reduced levels of foreign direct investment and disadvantages in international/global trade. The term "corruption" is used in very intensively lately and almost every government in the region has to deal with accusations of corruption, as well as demands for liberalization and reforms.

Because of the large amounts of corruption in the various levels of the political systems and public services of the countries in the region, it is safe to surmise that more and more countries will have to deal with demands for curbing corruption, from within the state and/or from outside of it. Probably, economic interests will shape the structure of those political reforms and play an important role in their design.

Globalization has the potential for improving the state of corruption in the region. It provides new economic opportunities, and in order to realize them it is

required to curb corruption. In addition, there are actors like the World Bank, who recently played an important role in the fight against corruption in the Middle East. However, in the meantime, it is evident that economical incentives and international pressures are inadequate for changes to occur. Paradoxically, what is needed the most for curbing corruption in government is a healthy civil society, vital political system, and a good government—three elements that are absent in most of the countries in the region.

Possibly, the future of corruption and anticorruption in the area lies in the hands of the international community and global actors. Another possibility is the rise of integrity ethos from within one or more of the countries, but past experience does not leave us too optimistic in this point.

The political responses to pressures for structural and institutional reforms might lead to democratization in the region and/or in specific countries, like Egypt. But the accusations of corruption, if indeed they will be stronger and more powerful in certain countries as can be expected, might end up differently—with the rise of new types of non-democratic regimes. Among the many important and interesting questions we can ask about corruption in the Middle East, is whether the efforts for democratization, as an institutional effort to curb corruption (and other political evils like poverty and terror), will lead to democracy or not, and whether democracy, if there will be democracies in the region, will decrease corruption and lead to better regimes and politics. Nevertheless, because of the existence of large amounts of corruption in politics all over the area, the growing awareness to the subject, and because of the politics of corruption all over the world, one can speculate that in the near future the issue of corruption in the Middle East will function as catalyst for constitutional and political changes in the whole region.

Milgram Experiments

Holona L. Ochs
Andrew B. Whitford

Department of Political Science, University of Kansas, Lawrence, Kansas, U.S.A.

INTRODUCTION

Stanley Milgram's classic experiments, conducted between 1960 and 1963, sought to demonstrate the power of social influence by examining how subjects related to authority. The initial studies were later followed by several variants intended to test the factors mediating the conformity identified in those first experiments. The results of this research agenda are quite robust, having been replicated in numerous cultural contexts and appear to hold up well over time. In short, subjects of many social groups, and even some of arbitrary definition (i.e., men and women, and even Americans, Germans, Europeans, and Latinos), exhibit high levels of obedience to authority, and the overall levels of conformity remain relatively stable over time. Milgram shows that authoritarianism and conformity are not confined to particular social groups or "types" of people or even to types of situations. In fact, six out of every ten people will kill you if told to do so by someone in authority under a variety of circumstances.^[1]

Moreover, Milgram's experiments are important because they have strong implications for ethical behavior on the part of experimenters who study authority relations in controlled settings. Many recent innovations in the protection of human subjects in experimental and other research settings are broadly due to the innovations introduced—and the resulting findings—by Milgram. For example, the American Psychological Association's *Ethical Principles in the Conduct of Research with Human Participants* (1982) make direct reference to these experiments and their findings on social authority in controlled settings. Most importantly, Milgram's experiments have great importance for the study of public policy generally, and public administration specifically. The current use of human subjects committees is particularly relevant, as well as the more pressing matters of social regulation and control in hierarchical settings.

HISTORICAL CONTEXT OF THE MILGRAM EXPERIMENTS

In the early 1960s a considerable amount of research was being conducted attempting to explain the

atrocities of World War II. Generally, researchers sought an explanation for the human cruelty exhibited during this period, and there was a tremendous desire to attribute the violence to a readily identifiable characteristic that would allow people to identify that thing that must be something fundamentally different about someone who would participate in such depravity—or at least that the degeneracy of the circumstances produced such behavior in some individuals. Of course, efforts to assign responsibility for the atrocities exacted by the Nazi regime had resulted in many participants being charged during the Nuremberg Trials. The primary defense for the accused was that they were merely following orders. The vast majority of the research examined the authoritarian traits of the German people,^[2–5] that is—with the exception of Milgram's studies.

The central importance of Milgram's studies^[1,6–8] is that they attempted to pit moral values against the demands of authority in an experimental test of human behavior under social pressures to conform.^[1] Milgram placed his experiments in the discursive field that linked his research with momentous examples of human barbarism, such as the treatment of the Jews by the Nazis in Germany and the My Lai massacre in Vietnam. He reasoned that most people would exact harsh consequences on others under certain conditions, particularly when given orders by someone in authority. Most importantly, he shows that people have an incredible tendency to conform and that in fact, most people would participate in violence under similar circumstances.

The Milgram experiments profoundly influenced the discourse on human nature, group behavior, ethics, public policy, and public administration. Specifically, the findings challenge some widely held beliefs about the capacity for human cruelty. The dispositional view that there must be something in the German character that makes them particularly cruel did not hold up when tested. Instead, the Milgram experiments undermine notions that human behavior is genetically determined or culturally determined. The results illustrate that human behavior is constrained by individual values to the degree that social influence and the situational characteristics are imposed.

METHODOLOGY

The initial experiment conducted by Milgram on obedience to authority began in a lecture theater where a group made up of psychiatrists, university students, and middle-class adults of various occupations and ages gathered for a lecture on obedience to authority.^[8] Here we describe the situation Milgram asked his audience to imagine at the end of the lecture:^[9]

In response to a newspaper add offering \$4.50 for one hour's work, you participate in a Yale University psychology experiment investigating memory and learning. You are introduced to a stern looking experimenter in a white coat and a mild-mannered individual introduced as your co-participant. The experimenter explains that the study examines the role of punishment in learning, and one of you will be the teacher and one will be the learner in this experiment. You are randomly assigned to the role of the teacher, and the three of you then proceed to an adjacent room, where the other participant, the "learner," is strapped into a chair. The experimenter explains that this is to prevent excessive movement during the experiment, but it is also obvious to you that the learner is unable to remove himself from the chair if he so chose. Then, conductive gel is applied to an electrode is subsequently attached to the learners arm, and the experimenter explains that this is to prevent burning and blisters. Both you and the learner are shown the electric shock generator that will deliver electric shocks that will serve as punishment for incorrect responses. The generator has 30 switches labeled with a voltage ranging from 15 to 450 volts. Each switch also has a rating, ranging from "slight shock" to "danger: severe shock," and the final two switches are labeled "XXX." The other participant assigned to the learner role asks if "the shocks will hurt" to which the experimenter replies, "although the shocks will be painful, they cause no permanent tissue damage."

Your role is to teach the learner a simple association task, but you also are told by the experimenter that you are required to punish the learner for incorrect responses. You are told that for every incorrect response you must increase the voltage by one more switch (15 volts). You are given a 15-volt shock to check that the generator is functioning adequately and to demonstrate the tingling sensation of 15 volts. The learner makes frequent errors during the experiment, each resulting in a higher voltage shock than the previous one. At 75 volts, 90 volts, and 105 volts, you hear the learner "grunt" through the wall. At 120 volts, the learner says the shocks are getting painful. At 150 volts, he screams, "get me out of here! I refuse to go on!" His protests continue as the voltage increases.

At any point that you question whether you should continue, the experimenter tells you to keep going, saying, "you can't stop now", "he is getting paid to do this experiment" or "the experiment depends on

your continuing compliance." He may even say "you have no choice." At 300 volts, the learner pounds on the wall and demands to be let out. After 330 volts, there is no longer any response from the learner, at which point the experimenter tells you that the learner's failure to respond should be interpreted as an incorrect response and to continue increasing the shock level. The experiment concludes when the highest shock level is reached or the learning task is completed.

Following the lecture in which the audience was asked to image the scenario described, each member of the audience was asked to anonymously record how he or she would have responded under the circumstances described. Members of the audience reported that they would have disobeyed the experimenter early in the experiment because they "didn't want to hurt anyone," and no one in the audience reported that he or she would continue beyond 300 V, the level indicating "danger: severe shock."^[9]

What we now know is that when Milgram conducted the experiment described to the audience in the preliminary study, the "learner" was actually a confederate.^[8] He found that more than 60% of the participants inflicted the maximum level of electric shock, and none of the participants disobeyed before 300 V.^[1] Despite the prediction by the psychiatrists in the preliminary study that only "pathological sadists" would administer electric shocks to 450 V, the experiment revealed that ordinary people will inflict pain on another person under the right set of circumstances, particularly when told to do so by a legitimate authority.^[8] The study also exemplifies the tendency to overemphasize dispositional factors and underestimate situational factors when making attributions about actions, referred to as a *fundamental attribution error*.^[10] For example, people tend to assume that if someone has not done much today, it is because he is lazy; rather than assuming that he is tired or lacks the right resources.

Milgram conducted several variants of the experiment to test the factors that might mediate conformity, including surveillance by the experimenter and proximity of the learner to the teacher. Several characteristics of the study participants, experimenter characteristics, attributes of the confederate learner, and features of the experimental setting were manipulated in subsequent studies. In one variation, the learner asks for the shock, and not a single participant exceeds the constraints of the test manager.^[1] It is evident that the presence and the demands of legitimate authority define the boundaries of behavior for the participants to a considerable extent.

It should be noted that a number of complaints about the Milgram experiments—beyond ethical considerations—are possible and have been voiced. For example, a central component in all of the Milgram experiments is the incremental shock procedure.

By using a graduated series of shocks it may be possible that subjects faced an innocuous beginning that elicited compliance before any of the frightening implications of the procedure were clear to the subject. That means that subjects were not presented with any sort of “qualitative breakpoint” at which they might shift from obedience to disobedience. This procedure is held by some as a fundamental component that should have been varied within the experimental context.^[11] Additionally, the studies took place during the epoch of behavioralism in the field of psychology. Consequently, the criticisms of a strictly behavioral approach are applicable to evaluating the Milgram experiments. In particular, Milgram’s focus on the appearance of authority and the ambiguity of notions of authority and obedience make drawing conclusions about human nature a substantial leap.^[12] However, subjects’ protections put in place because of the original protocol now make it difficult to replicate or extend it in any way that would meaningfully test these complaints.

IMPLICATIONS FOR PUBLIC POLICY AND PUBLIC ADMINISTRATION

Efficient and legitimate institutions can be used for constructive or destructive purposes.^[13]

During Adolf Eichmann’s testimony at the Nuremberg Trials, he claimed that he had nothing personal against the Jews or anyone else and stated that he found the concentration camps repugnant, but at the same time he described the meticulous organization of the deportation and extermination of several hundred thousand people.^[2] He contended that he had an obligation to perform the administrative duties as assigned by the Third Reich because had he refused to be obedient and responsive to the political authorities, then every soldier from any army would have the right to disobey any order considered personally objectionable. In fact, the Holocaust would not have been possible without the obedience and conformity of the public service, implementing the policies of the Nazi regime efficiently through routine practices.^[13] In essence, latent tendencies toward dehumanization exist in the routinization of any process.^[13]

However, some degree of conformity is necessary for the adequate functioning of any society. It is difficult to conceive of how decisions could be made and enforced—and actions implemented—without the recognition of some sort of authority. There is a reciprocal nature to the use and acknowledgment of authority. Public trust is essential to acquiring the compliance necessary to accomplishing civic purposes, and public servants are obligated to champion the public interest with empathy, respect, and consideration for future generations to obtain that trust.^[14]

Additionally, hierarchy is an implicit component of any social regulatory regime because people vary in their readiness to obey and to extend trust. Useful hierarchical relationships require competence of the authority system.^[1] For example, spectators in a concert hall do not respond to the instructions of the conductor. Authority is considered legitimate only by those who are incorporated into a system supporting that authority’s legitimacy. This point is crucial when it comes to understanding policy and administration because those who are not integrated into the system have no investment in maintaining it. In fact, the alienation of people from society’s institutions, processes, benefits, etc., undermines the legitimacy of the system, threatening the security and stability of the entire social group.

Conformity can also serve society in important ways.^[1,15] For example, hierarchically organized groups are tremendously advantageous in addressing dangers or threats to security. Second, organizations provide stability and serve to facilitate cooperation among group members. Third, contesting hierarchical organization can lead to greater levels of violence. However, resolving the questions that arise when individual values and the demands of authority conflict remains among the central philosophical problems. Determining the nature of man and the role of values in society is integral to developing adequate policies.

Studies of public policy and public administration can draw several insights from the Milgram experiments. For example, Milgram outlines several preconditions for obedience.^[1] Some basic attributes—such as the authority structure of parental authority within the family structure—directly condition conformity. The larger institutional framework within which we all operate also solicits obedience. Even while institutional settings teach us that one’s opinion is possible and important, for smooth functioning obedience is necessary. Rewards and sanctions of various types in a range of settings are structured to elicit conformity. This is essential to easing relations and facilitating transactions between individuals and groups.

In addition, an assortment of policy changes can be attributed to the Milgram experiments. The study itself raised numerous ethical considerations. First, participants volunteered for a learning experiment, a choice that is itself not a test of obedience. Although deception was essential to testing the obedience to authority, participants were not afforded critical information that may have affected their decision to participate, and they were deceived as to the nature of the experiment (i.e., the shocks were not real, and the learner was a confederate). Second, participants were filmed without their consent, with important implications for current practices about subjects’ consent. Third, the strength of the social pressure made it very unlikely

that participants could actually discontinue their participation if they so chose. Fourth, many of the participants exhibited severe and persistent psychological reactions to participating in the experiment. It is important to point out that the experiment itself exemplifies the principles under investigation. A study inquiring on the cruelty of humanity was continued through numerous trials despite the knowledge that there are detrimental effects on participants.

Eventually, the experiments were discontinued, and standards were developed for research that involved human subjects. The resulting policy requires research proposals to be reviewed by a *human subjects committee*. Only research meeting the standards for the treatment of human subjects is approved by the committee and capable of being carried out. The authority of human subjects committees and the standards of research practice hold considerable legitimate authority, and there are very high degrees of conformity to those standards in the United States. The federal policy for the protection of human subjects is implemented by the Department of Health and Human Services and is integrated into the procedural process of every public and private organization conducting research involving human subjects in the United States. Further, information about the federal human subjects research guidelines can be found at the United States Office for Human Research Protections (<http://ohrp.osophs.dhhs.gov/index.htm>).

CONCLUSION

Because the results of Milgram's research agenda are quite robust, having been replicated in numerous cultural contexts and over time (see Ref.^[16]), we now have a fundamentally different understanding about how authoritarianism and conformity are not confined to particular social groups or "types" of people or even to types of situations. We have also discussed the strong implications for ethical behavior on the part of experimenters who study authority relations in controlled settings, and recent innovations in the protection of human subjects in experimental and other research settings are broadly due to the innovations introduced—and the resulting findings—by Milgram. Readers seeking more information about the Milgram experiments should consult the works cited here, and general studies such as Ref.^[17] but a most instructive

introduction is located at the Milgram Reenactment (<http://www.milgramreenactment.org/pages/index.xml>), an online resource about the experiments and their lasting contribution to our understanding of authority, in all its forms.

Mitigating HIV/AIDS' Impact on Teachers and Administrators in Sub-Saharan Africa

Terry F. Buss

*Center for International Affairs, National Academy of Public Administration,
Washington, District of Columbia, U.S.A.*

Mumukshu Patel

National Academy of Public Administration, Washington, District of Columbia, U.S.A.

INTRODUCTION

As is well known, Sub-Saharan Africa has been devastated by the HIV/AIDS pandemic. Recent estimates (as of December 2004) by the World Health Organization show 29 million people infected, with an additional 2.5 million being infected annually and cumulative AIDS-related deaths at 13.7 million. Although only 10% of the world's population lives in Sub-Saharan Africa, nearly 60% of the world's HIV-positive population resides there.^[1,2]

If the direct, immediate impacts of the epidemic were not enough, the longer-term consequences could be even worse. One emerging area of concern is the impact on the education sector—not only on teachers (including university professors) and school administrators but also on civil servants in Ministries of Education. Although figures are not widely available, preliminary statistics^a are frightening.^[3,4]

Teacher attrition from AIDS is estimated to be highest in Kenya (25,000), Nigeria (22,100), South Africa (44,900), Uganda (14,900), and Zimbabwe (16,200).^[3] Some 200,000 of Sub-Saharan Africa's 650,000 teachers are projected to die from the disease.^b At present, more than half of education positions are unfilled. Globally, it is estimated to cost \$1 billion annually to compensate for the loss and absenteeism of teachers from AIDS.^[2,5] Estimates suggest that an

infected teacher loses about 6 months of professional working time before developing full-blown AIDS, while an average of 1 year lapses between the onset of clinical AIDS and death: Teachers experience about 18 months of increasing disability before leaving the school system.^[6] What does the loss of large cadres of teachers, school administrators, and civil servants in the education sector mean to Sub-Saharan African countries? To begin with, the public sector is arguably the largest employer in Sub-Saharan African countries, and the education sector makes up the lion's share. Heavy casualties imply that this and the next generation of young people will not receive the education they need to become productive members of society. Young people will be unable to find employment either in the private or public sector, and will experience difficulty in starting their own entrepreneurial endeavors. Loss of administrators and civil servants will remove skilled workers from the bureaucracy that manages education. Remaining public sector employees will be pushed to the limit, trying to cover work previously performed by others. Productivity will decline precipitously, not only from deaths but also from absenteeism among those affected or caring for relatives. Advances in economic development and growth will be reversed, perhaps for decades in the future. Development will not be sustained (see Fig. 1).

BACKGROUND

In the past, many believed that loss of teachers, school administrators, and civil servants would not be terribly devastating, essentially self-correcting, for at least two reasons: First, they believed that civil service employment was fairly low-skilled and that the vast pool of unskilled workers in many countries could be easily trained to replace those lost to the system. Second, they argued that populations devastated by AIDS necessitated a decrease in administrators and teachers, so the system would maintain its equilibrium. Those holding

^aThe Association for the Development of Education in Africa (ADEA) is a group of Ministers of Education from African countries attempting to identify the impacts of the AIDS pandemic on education and to devise strategies for addressing it (see www.adea-net.org/workgroups/en_adhocvih.html).

^bThere are no definitive studies explaining why teachers are so vulnerable to HIV infection, or whether they have higher prevalence rates than the general public. Anecdotal evidence suggests that they, like the general public in rural areas, lack information about prevention—"safe sex." Teachers' sexual exploitation of students in exchange for "good" grades may increase transmission of disease. And tribal beliefs—e.g., having sexual relations with virgins to cure AIDS—may also spread the disease.

Fig. 1 HIV/AIDS impacts on education and the economy. (Adapted from World Bank, www.developmentgoals.org, 2004.)

these beliefs are clearly wrong. The pool of unskilled labor generally cannot be converted to education sector employees, and those who could be trained require more skills than can be transferred in a short time. Even if they could be trained, they would be likely absorbed into higher-paying jobs in the private sector, non-governmental organizations, or development agencies. On the second point, it is true that millions of children are dropping out of school and dying because of AIDS. In fact, by 2010, between 10% and 20% of primary school age children will be lost to the disease. It is also true that there are many more who are not infected, but have become orphaned,^c drafted into the labor force to help parents, or have become caregivers for infected relatives. These children still have educational needs, but they simply cannot access the traditional education system given their circumstances.

National governments need to devise strategies for preventing AIDS' impacts on teachers, school administrators, and civil servants where they can, and managing the consequences of the epidemic on the education sector that are already well underway. Formal strategies are now required as a prerequisite for receiving funding from the Global AIDS Fund and for loans from the World Bank. A national strategy will require:

- Stemming further attrition in the ranks of teachers, school administrators, and civil servants through prevention.
- Training a cadre of workers to replace those lost in the public sector.

- Re-engineering the workforce to cover functions affected by attrition.
- Re-engineering ministries, schools, universities, and educational bodies to make them more efficient and effective in light of a changing workforce.

Government reform and advancement has been difficult to attain and sustain in many Sub-Saharan African countries, irrespective of AIDS. Overlaying the effects of the epidemic makes educational workforce issues even more problematic for policy makers. Ironically, it might compel African governments to rethink government and education generally, perhaps with positive outcomes. Uganda, for example, realized that the disease was a problem early on, and did something about it, reducing its prevalence substantially more than any other African country.^[7,8]

Most countries initially relegated management of the epidemic to the Ministries of Health with little involvement from or concern about other ministries, including Education. With assistance funding now flowing to many countries in Sub-Saharan Africa, disease management has now been made the responsibility of National AIDS Commissions. This strategy, in hindsight, only makes sense if the epidemic is solely a health problem, requiring prevention and treatment. But the downward spiraling effects of AIDS on the education workforce itself require a broader strategy. Thus far, Sub-Saharan African policy makers and the international community are just beginning to address the problem and few countries have crafted responses to it.^[9] The Global AIDS Fund, for example, is yet to award funding to countries wishing to pursue education workforce capacity-building strategies, focusing instead on prevention and treatment. Malawi has become proactive on the issues and is exploring the possibility of providing antiretroviral (ARV) drugs to its employees to extend their work-life. The country

^cThe AIDS pandemic has created legions of orphans who have no parents, no means of livelihood, and will not likely complete school. For a review of this issue, see: Kalanidhi, S.; Diane, C. *Reaching Out to Africa's Orphans*; World Bank: Washington, DC, 2004.

is building a management information system to keep track of critical skill losses and possibilities to fill those skilled positions. The republic is also creating educational scholarships to fund college degrees for critical staff.

Policy makers in the international community are implementing programs to raise awareness of and stimulate action around the AIDS issues given above, but these are still in their infancy. The UN Educational, Scientific and Cultural Organization now operates a website clearing house addressing *HIV/AIDS Impact on Education*; ILO offers a program, *HIV/AIDS and the World of Work*, which focuses in part on educational institutions and workforce issues; the World Bank has let contracts for studies in this arena;^[6] and organizations like the Association for the Development of Education in Africa have held conferences on the topic.^[10]

Major strategic approaches employed or at least being considered by national governments to combat AIDS may be clustered as follows:

- Information/data availability essential for planning, decision making, and evaluation.
- Capacity building to ensure effective short-term responses, maintaining the smooth functioning of the system.
- Constructive partnerships for generating a comprehensive effort to combat the spread of AIDS.
- Resource-intensive long-term initiatives to stabilize workforce supply and guarantee appropriate prioritization of development issues in Sub-Saharan Africa.

The strategies highlighted above consider two factors: implementation viability in political and economic terms, and their effectiveness as policy instruments to mitigate the pandemic's impact on teachers and civil servants.

INFORMATION/DATA AVAILABILITY

It seems reasonable to assume that AIDS impacts the education sector in a significant manner, given reports of teacher and student absenteeism and attrition. But there are less reliable data on, and considerable data gaps about, how the pandemic affects the education sector. Data extrapolated from aggregate sources—like census information—to analyze AIDS impacts overlook several critical issues, including the varying rates of HIV infections across space and working groups. For example, teachers and administrators in one district may be infected at different rates than in others, or primary teachers may be infected at lower rates per student as compared to secondary school teachers.

These differences require diverse policy responses if one wishes to successfully combat the pandemic. In Zimbabwe and South Africa, policy makers have begun putting into place local data gathering and exporting programs. The programs rely on monthly administrative—e.g., attendance records—and survey forms completed by teachers and staff to provide early warning signs of problems.^{[11]d}

Finally, to obtain accurate data, there must be a friendly workplace environment, free of discrimination against victims of the AIDS pandemic. Civil society organizations have held a series of “community conversations” to help mainstream discourse on AIDS and to encourage testing and treatment.^[7] In the interim, until better data are available, policy makers might create flexible capacity-building initiatives to help mitigate AIDS impacts.

CAPACITY-BUILDING INITIATIVES

A potentially effective capacity-building initiative involves training teachers in focused, demand-driven training workshops. The Mobile Task Team approach—funded by U.S. Agency for International Development (USAID) and implemented by the Health and Economics Research Division at the University of Natal, South Africa—conforms well to this strategy and might warrant replication. In fact, the USAID is now rolling out a similar initiative in Western Africa.^[7,10] Training workshops for workers in the education sector must be executed in a timely fashion, and tailored to local demand. Emphasis in these training sessions should be on facilitated reflection and application to increase their effectiveness.^[8] Otherwise, these training workshops will degenerate into drab sessions that induce “workshop fatigue” among participants because inundation by invitations from legions of vendors will set in, stifling these initiatives. This approach views the increase in diminishing

^dLack of computer equipment and Internet access, endemic to most of Africa, need not impede efforts to track and manage the AIDS epidemic as this initiative illustrates. The District-Level Education Management and Monitoring Information System (DEMMIS) program in Harare is one possible model to assist to manage and mitigate the impact of HIV/AIDS on education. By using inputs from survey forms and attendance records at educational institutions and the Ministry of Education, it provides early warning indicators and a decision support system management, enabling policy makers to manage and mitigate HIV/AIDS impacts. Analysts update DEMMIS every month, making it sensitive to changing local conditions. This helps measure program effectiveness in specific areas. Initial results have been encouraging, but the program has been in existence for a relatively short time and has only been tested in some provinces of Zimbabwe and South Africa. The program might be further analyzed to see how it can be improved and replicated elsewhere.

capacity of the education sector in Sub-Saharan Africa as spontaneous and unpredictable gaps in the system that need to be fixed rapidly. Some scholars have termed this phenomenon as the “Swiss cheese model.”^[7]

Another critical capacity-building initiative involves acquisition^e and distribution of ARV drugs as part of a work incentive package.^f Mere distribution of ARV drugs to educators is not adequate. A strong distribution and monitoring framework must be in place to ensure proper and effective usage of ARV drugs. Toward this end, Sub-Saharan African Ministries of Education and Health might develop a comprehensive and coordinated strategy modeled after programs offered by *Médecins Sans Frontières* (MSF), which offers ARV drugs only to people who have an elevated antibody count. Medicines Sans Frontiers, somewhat controversially, requires patients to bring along a companion as a “goodwill” demonstration of their willingness to talk about the disease with others.^[12]

CONSTRUCTIVE PARTNERSHIPS

Cross-sectoral partnerships among international aid agencies, national and local governments, private sector and public sector enterprises, non-governmental organizations, and civil society groups are critical in mitigating AIDS impacts on education. Only a sustained, comprehensive partnership approach can effectively combat AIDS, because the pandemic is spread across society: to deal with it, all segments of society—businesses, civic groups, religious groups—must embark on a joint crusade. In Botswana, a group of 40 AIDS organizations facilitated information sharing between different sectors—public and private—to improve service provision.^[13]

Teachers and administrators may wish to adopt best practices from the private sector's approach to protecting its workforce from the pandemic. Best practices can be adopted from the models like that of Debswana Diamond Company (Botswana).^[14] In 1991, the company created program coordinators at its mining

locations, establishing a comprehensive AIDS management workplace policy in 1996 and distributing ARV drugs to infected employees beginning in 2001.

Information technology (IT) companies and Ministries of Education might collaborate to automate information storage and retrieval.^[15] The personnel-based, public information system creates critical barriers to system functioning when key individuals—clerical and administrative—are absent, sick, or deceased. Growing awareness created partnerships between donor agencies like USAID and multinational corporations like Cisco, providing training to teachers and administrators in Uganda.

Training provided by IT companies might enhance social capital and skill levels in Sub-Saharan Africa, boosting economic growth and development prospects.^[15] Use of the Internet builds networks in ways that expand interpersonal relationships not always possible in face-to-face relationships. Nevertheless, IT usage can supplement or complement face-to-face relationships. Non-governmental organizations, like *Médecins Sans Frontières*, and international governmental organizations (IGOs), like the World Health Organization, can provide expertise to the Ministries of Education to help with ARV drug distribution and procurement.

Some have argued that national governments, international agencies, and NGOs in Sub-Saharan Africa might pool their resources to develop an AIDS vaccine. African universities and research laboratories can help in this endeavor. In 2004, G8 countries set aside funding for research, and South Africa has launched its own research initiative. Regardless, Ministries of Education must try to ensure cooperation across agencies on this front.

Partnerships between developed (North) and developing (South) countries are critical to mitigate HIV/AIDS impacts on education. Retired teachers from Northern countries can serve for 2 years in Sub-Saharan Africa to help replenish teacher ranks, a program modeled after the Peace Corps' “Crisis Corps” initiative in Swaziland. African universities also might team up with international aid agencies to create capacity-building initiatives, like the Mobile Task Teams.^g

Grant writing programs might also be developed for African universities to help local governments, civil society organizations, and schools access internationally available development funds. This is because an increasing number of donor aid funds require that recipients make a formal request for fund disbursement.

^eFor a review of issues surrounding ARV drug acquisition, see: Yolanda, T., Ed. *Battling HIV/AIDS: A Decision Maker's Guide to the Procurement of Medicines and Related Supplies*; World Bank: Washington, DC, 2004.

^fThis program is controversial, raising ethical questions such as why should teachers receive priority over any other group. Proponents apparently feel that teachers are critical to Africa's development and central in many ways to the progress of the pandemic, and therefore need to become part of the solution, not a continuing part of the problem.

^gSee USAID website at http://www.usaid.gov/locations/sub-saharan-africa/publications/docs/hived_brief.pdf for details of this program.

LONG-TERM STRATEGIES

The best long-term strategy might be to establish teacher training institutes across Sub-Saharan Africa. The most effective one to curb the ill-effects of AIDS on education is to create academies in key regions of Sub-Saharan Africa. These institutes would train teachers and administrators to narrow the gap between supply and demand in the education sector. They would also improve the capacity of the education civil service and administration to perform more effectively and efficiently.

Long-term national and regional strategies are required for development generally, as well as the education sector in particular, for ensuring the best possible prioritization of development issues and resource allocation in Sub-Saharan Africa. Countries like Uganda have also made AIDS a high priority in its development plan, and have seen great progress in reversing the epidemic. The New Partnership for Africa's Development (NEPAD)^h might want to lead on this front by creating a viable regional strategy to prioritize development issues and create a comprehensive regional strategy for education in the wake of the HIV/AIDS pandemic.

CONCLUSIONS

Strategies discussed here may not solve HIV/AIDS problems for teachers and administrators in the Sub-Saharan Africa. Lack of fieldwork and program/project evaluations constrains our ability to predict the likelihood of success for these strategies. Nevertheless, many observers believe that it is important to try to turn the pandemic, even if only through uncertain experimentation.

Model Contracts to Reduce the Risks in Complex Information Technology Procurements

Michael Asner

Michael Asner Consulting, Surrey, British Columbia, Canada

INTRODUCTION

Model contracts are valuable tools. Their use can reduce the risks associated with complex contracts, identify issues for consideration and resolution during the negotiation process, and serve as models for similar procurements in other jurisdictions.

Contract negotiation is an important and critical element in dealing with suppliers. It is part of the procurement process. There is little point in including an incomplete or poorly drafted contract in the request for proposal (RFP) stage, or introducing it into the negotiation process. It is the contract that formalizes the intent and agreement of the parties and must therefore accurately document all the terms and conditions. The contract must be enforceable in court. It must also reflect the understanding and expectations of both parties.

In many RFP processes, it is the procurement professionals who have the responsibility of ensuring that the contract protects the agency, and reflects a shared understanding of the entire business deal. Traditionally, procurement officers have been at a disadvantage when dealing with suppliers. Few procurement officers are lawyers; in contrast, suppliers are very knowledgeable about protecting their rights and the nuances of the law. Often, procurement personnel are dealing with unfamiliar technology, and to make matters worse, many procurement teams have limited access to legal help during the contract development phase of procurement. Simply stated, procurement professionals are at a disadvantage.

accompanied by some training, a set of instructions, and possibly a web-based, fill-in template. It is more than simply a list of contract clauses.

Model contracts are only developed for commonly recurring complex purchases, e.g., the acquisition of a new computer system, software, or a systems integrator. Almost all model contracts are for information systems and technology because of the volume and frequency of technology-based RFPs, the high value of the procurement, and the inherent complexity of information technology (IT) acquisitions. They serve as a starting point for development of the specific and complete contract to be included in the RFP.

Most procurement personnel are not lawyers, nor are they subject experts knowledgeable about network protocols, e.g., systems integration or bridge construction. Over the years, many organizations have expended great amounts of time and energy to develop model contracts. The use of these contracts reduces the risks to buyers by identifying issues, risks, and remedies. “Home-grown” contracts are simply too risky, and they prolong negotiations, increase prices, and often abandon remedies which would be available to the agency.

In many jurisdictions, the procurement authority has prepared a set of model contracts designed to meet the majority of the needs of their agencies and departments. These needs are not unique to procurement in the United States; they exist in many other places including Australia, Canada, Hong Kong, and the United Kingdom. In Australia, one of the state governments has developed a set of principles for their model contracts. These principles can be applied in other jurisdictions. They believe that contracts should be based on the following:^[1]

- terms and conditions that are fair to all parties—the contract should incorporate a spirit of mutual trust;
- schedules and annexes that allow users flexibility in customizing contracts to suit their individual requirements;
- a format that is user-friendly and in “plain English” style;

OVERVIEW

Model contracts are an attempt by organizations to ensure that their rights are protected, without relying heavily on expert legal help for each new contract. A model contract serves as a template for developing a specific contract. There is a high initial cost associated with developing a model contract for use throughout an organization. Ideally, the model contract is

- a style and language suited to the end users of the products and services;
- consistency in terminology, definitions, and style;
- inclusion of the following elements:
 - a dispute resolution mechanism (e.g., appointment of adjudicator, referee, or expert),
 - performance incentives,
 - allocation of risks.

The last word on this topic goes to the State of Victoria, Australia, where its purchasing board cautions the agency procurement people about using standard or model contracts. They state that the use of the model contracts is not a substitute for:^[1]

- people thinking about, then clearly stating what they require;
- negotiation of terms to suit particular circumstances, where necessary;
- proper planning early in the tendering process;
- careful selection of the supplier;
- competent contract management; and
- creating and maintaining a working relationship with a supplier.

A BRIEF SURVEY OF SEVERAL JURISDICTIONS

A model contract is much more than a standardized set of terms and conditions which is the basis for a purchase of goods. It is complete, fully describing specific types of procurements such as computer applications software. Models differ in their level of detail, the amount of instruction and tutorial material provided, and the topics covered.

Many jurisdictions provide good examples of these model contracts and can be major sources of information. For example, the state of Victoria, Australia, has developed model contracts, a checklist of contract clauses, and a 35-page user guide.^[1] The state of Washington, U.S.A., has an 8-page guide that includes a checklist of clauses, and four model contracts for information technology.^[2] In 1999, California developed new draft model for IT contracts.^[3] All of these resources can help public procurement professionals in planning the RFP process and in negotiations.

In the remainder of this section, we will provide a brief survey of how model contracts are dealt with in several representative jurisdictions. All of these contracts deal with different aspects of information technology, reflecting the frequency, volume, and complexity of procurement acquisitions. Each of these examples is web-based, so that the information can

be centrally managed and, at the same time, easily accessible by people throughout the organization.

We begin with the **State of Montana**.^[4] This is the starting point for the development of a complete, robust, easy-to-use model contract facility. Their web site contains the minimum amount of data, a table of 84 “Standard Contract Language and Forms.” There are two types of entries. First, contract elements which should be used by all state agencies “in every bid, proposal, purchase order, or contract.” An example is the clause dealing with Access and Retention of Records. The second type of entry is contract elements, which are to be used as required. An example is the clause dealing with “alternate bids,” which is only used in certain types of procurements.

The system in the **State of New York** contains much more data than that in Montana.^[5] It is further along the road to the ideal model contract facility. The Procurement Services professionals in New York provide their users with a 7-page guideline to promote “a better understanding of the types of contracts available and a “blueprint” for effectively utilizing the many types of technology contracts used.” These guidelines deal with the different types of contracts and different procurement strategies. It provides guidance on establishing technology contracts, and on how to process a known requirement. While it does not contain model contracts, it does provide access to all current technology contracts, and their underlying RFPs.

The **State of California** has developed a set of model information technology contracts.^[6] To build a draft contract, a purchasing official simply uses an approved “Standard Agreement Form” and attachments. The attachments consist of a Statement of Work for the services required, and terms and conditions selected from five Model IT contracts:

- Information Technology General Terms and Conditions,
- Information Technology Purchase Special Provisions,
- Information Technology Maintenance Special Provisions,
- Information Technology Software License Special Provisions,
- Information Technology Personal Services Special Provisions.

According to the Procurement Division, the benefits of using the new model include the following:

- The use of one model for all IT goods and/or services purchases, whether using a formal bid exceeding \$500,000 or informal bids below \$500,000.
- Statewide standardization.
- Increased familiarity with the elements and provisions of the model.

Washington State^[7] provides another example of a model contracts facility for information technology. It is composed of a set of instructions and model contracts for equipment, software, purchased services, and personal services. Each contract, with its embedded instructions, is between 40 and 60 pages in length. The model contract for software, for example, contains 71 clauses, 3 schedules, and 2 exhibits. Obviously, not every clause will be required in every contract, nor will this contract deal with every issue related to a specific software acquisition. The instructions caution the agency that contracts should be created from the model plus other sources to meet specific needs.

The model contracts and instructions are available from the state's web site. The contracts contain color-coded instructions and fill-in-the-blanks so that agencies can create draft contracts without a separate set of instructions. While specific laws and legal requirements vary from jurisdiction to jurisdiction, these contracts can be used as a starting point—a checklist of issues—by procurement professionals outside the state of Washington.

The **Government of Australia** has set the standard for model contracts.^[8] It has developed a Government Information Technology and Communications (GITC) contracting framework. This was performed as a cooperative effort between industry and the Australian federal and state governments. The GITC web site contains extensive information useful in developing contracts, including the model contracts themselves. This version (Version 4) was developed to achieve the following outcome:

- Simplifying the contracting process for the purchase of IT-related products and services.

After developing their model contracts and user documentation, they made all of the information available via the Web. To increase the ease-of-use and access to this information, they implemented two innovations:

1. There is a web-based interactive program which anyone can use to develop a contract. You simply log on to the site and proceed to select contract clauses and input data. At the end,

you save your contract. The program provides significant content and functionality:^a

- Creating a new contract,
- Editing the contract details,
- Saving the contract,
- Printing the contract,
- Adding or removing categories from the contract,
- Opening an existing contract.

2. One can download a file, their “User Guide,” which is in fact their entire web-based model contracting system. As soon as this file is downloaded, the user can have access to their model contracting system through the user's own computer without having to access the Internet. Information includes:

- User Guide
- Frequently Asked Questions
- Contacts
- About GITC
- Head Agreement
- Terms and Conditions
- Appendices

The amount of information that this site provides is excellent, and the web site design makes it easy to access, locate, and use this information.

CONCLUSION

Model contracts are used increasingly by various parties. They are a good investment in any jurisdiction that purchases lots of information technology goods and services. With increasing public scrutiny, more litigation actions from aggrieved suppliers, fewer procurement staff, and decentralization of contracting, model contracts will become a major tool for imposing standards on the procurement process.

Models of Spatial Finance and “Voting with Your Feet”

Ray Gonzales

*Graduate Department of Public Administration, Rutgers University,
Newark, New Jersey, U.S.A.*

INTRODUCTION

This article explores the idea of housing choice as it was envisioned by Charles Tiebout. Centered around the idea that local government spending patterns influence the way people choose neighborhoods, his theory has done much to stimulate thinking and generate research in many disciplines. It is the intent of this piece to summarize and analyze that literature by examining extensions of the model, which include jurisdictional competition, capitalization, and the Leviathan Hypothesis. To assist the reader further a discussion of measurement issues, and their implications for interpreting research, is included.

SPATIAL FINANCE AND THE TIEBOUT MODEL

Spatial finance refers to the impact of taxpayer preferences on municipal fiscal characteristics. Charles Tiebout^[1] used spatial finance to speculate about rational choice determinants of neighborhood selection via the market mechanism of taxpayer mobility. The idea is that as the number of jurisdictions (e.g., municipalities) increases, the variability in the number of budgetary profiles also increases because financial decisions reflect the predilections of the respective constituencies. People gravitate toward, and are happiest in, those communities where spending patterns reflect their value choices (i.e., Tiebout sorting). Tiebout did not intend to reflect reality—just articulate the assumptions needed to develop a market theory of public choice in neighborhood selection. For such a theory to work, there were numerous assumptions to be made. Taxpayers would have to have complete mobility, knowledge, and disregard employment considerations during neighborhood selection; there would be a variety of communities from which to choose; for every pattern of community services, there could be no spill-over effects; there would exist an optimal community size (the greatest benefit at the lowest cost)—communities below the optimal size would seek to increase their numbers working towards an economy-of-scale, while communities above this size would seek to lower them; finally, and every jurisdiction should be limited by some fixed variable (e.g., geography). This is

the base theory. There is no mention of the size of government beyond the optimal size hypothesis or of the motivation of public officials, nor is the concept of competition among jurisdictions mentioned. These ideas and others would follow from these assumptions.

TIEBOUT EXTENSIONS

Tiebout's framework did more to stimulate theory and research than to explain the way society works. To date, the most comprehensive resource for articulating the conclusions on various themes in research is an article written by Dowding, John, and Biggs,^[2] reviewing over 200 pieces through the early 1990s. Consensus in the literature examining the many facets of Tiebout is scarce. Problems with method and an inability to adhere to the assumptions of the model have made drawing conclusions about concepts difficult.^[2] What is more, some arguments in favor of a Tiebout model have not held up to research findings. At best, the support for the base theory is mixed; the same holds for research examining residential contentment and Tiebout sorting.

Sorting is usually measured in terms of jurisdiction homogeneity—the extent to which people similar in type live together, figuratively speaking. Homogeneity can be operationalized in a variety of ways, including race, income, or preference for public good. Often, using methodological rigor as an interpreter, opinions on sorting remain cautious because some studies support hypotheses whereas others do not. The most that can be said for sorting is that jurisdictional cost–benefit issues are factors in making relocating decisions, but this does not approach the support needed to affirm sorting in general.^[3] Other work views school as a public good and comes to different conclusions about relationships with, or implications for, homogeneity.^[4–6] Some finds a tacit implication for sorting,^[4] showing an increase in the number of low-income households in states where decentralized public school financing is upheld.

Expanding Tiebout's theory to include a competitive element arose out of a need to overcome an obstacle described by Paul Samuelson^[7]—that a market analogy for the provision of public goods was not achievable due to the absence of a direct exchange mechanism. That is, a person paying for a service may

not be the only one experiencing the benefit and a person experiencing a benefit may not be the one paying for it. To get around this, researchers employing Tiebout assumptions conceptualized a competitive environment in which municipalities competed for resident resources. Almost everyone attributes this idea to Tiebout, but it is not clear how a competitive element can be introduced if local budgetary profiles are fixed, as his 1956 work maintains. Whatever the case may be, by relaxing the optimal size assumption and presupposing that the number of taxpayers is finite, researchers could hypothesize that municipalities would do their best to keep costs low via competitive tax rates and benefit levels high (to keep taxpayers satisfied with service and attract the greatest number of residents possible to that jurisdiction). Thus, a model of public service provision simulating a market environment was created. Today, Tiebout is synonymous with jurisdictional competition, but there is almost nothing in the research showing that governments compete with one another for residents, and what evidence is available is indirect or implied by the data.

The competitive implication carries with it a number of hypotheses for research in urban politics, public economics, and public administration. Using structural characteristics as predictors, one hypothesis held that large amounts of inter- and intrajurisdictional competition in a geographic area resulted in greater efficiency gains (i.e., decentralization hypothesis). Areas with fewer (and consequently larger) governments should produce public goods less efficiently than smaller jurisdictions. The review provided by Dowding, John, and Biggs^[2] suggested that this has been found to be true in the most general sense. Through the early 1990s, there were slight variations on this conclusion when exploring differences between single- and multi-purpose jurisdictions. One rationale for the finding linking jurisdictional size to efficiency was that as the number of jurisdictions increased, so did taxpayer ability to hold public officials accountable for services and policy choices. Unsatisfied residents “vote with their feet,” as mobility became a mechanism for accountability and efficiency. This has not been conclusively supported if you consider that research has shown Tiebout factors to be more important in the decision to enter a community than in the decision to leave. Refreshingly, work has shifted focus to more advanced stages of performance measurement by focusing on the effectiveness of public service provision,^[6] signifying an attempt to move beyond poorly operationalized efficiency pervading the research.

The tax competition literature possesses conflicting views on Tieboutian efficiency. One line of work says that competitive tax rates and regulation do not result in the efficient provision of public goods. Some believe that industry supplants residents as the focal point of

jurisdictional competition. Thus, communities alter tax policy and operating regulations to make themselves attractive to business. Others see the faults of tax competition in an argument similar to Theodore Lowi’s criticisms of interest group liberalism. Here, tax rates and regulations reflect the preferences of an influential minority, effectively replacing policy aimed at larger societal concerns with legislation benefiting the few. The quality of public goods falls, costs are externalized (e.g., neighboring communities are polluted), and property values are lowered (i.e., race-to-the-bottom). The alternative, supporting Tiebout and tax competition, contends that efficiency gains are associated with the competitive element in multi-jurisdictional taxation when examining the behavior of small groups.^[8] It is the suppressed tax rate that leads to greater efficiency and enhanced quality of public policy (i.e., race-to-the-top) because lower revenue streams force public officials to economize.^[9]

Another area of inquiry relating to taxation deals with an idea called capitalization. At the heart of capitalization is the distinction between a *tax base* and a *tax rate*. Crudely put, the tax base can be considered the value of property in a given community. The tax rate is the proportion or percentage of the property value assessed at tax time. If the tax rate is high, demand for houses should be low, and so should the tax base. If the quality of public service is high, there should be a corresponding demand for housing, a high tax base and a low tax rate. As an explanatory mechanism for Tiebout, capitalization does not do a good job, unless you know the effect of the tax rate and local services on property values (tax base).^[2] Schneider, using 1970s data, explored this effect and found that local fiscal policy affected the tax base.^[10] He also found that the tax base was negatively related to the tax rate. Although this suggests support for capitalization, caution should be exercised in accepting this finding because the coefficients speaking to the strength of relationship were quite low. New work looks at school finance reforms,^[5] arguing that centralizing local public school finance erases inequalities existing between rich and poor districts. Consistent with capitalization, property values and rents subsequently rise, and poor persons are unable to subsist in these municipalities.

A PROBLEM WITH MEASUREMENT

Conclusions about Tiebout derivations depend heavily on interpretation, knowledge of method, and the operationalization of variables. For example, in social science research there are primarily two levels of analysis—the micro and the macro. At the risk of oversimplifying the relationship by way of employing the distinction in a Tiebout framework, a microlevel slant

on research would take the individual as the unit of an analysis; meanwhile, a macrolevel approach would use the municipality as the unit of analysis. This is important because putting together a causal argument is easier when conducting research using microlevel operationalizations than when working at the macro level. This is important to the present discussion because the majority of the articles exploring Tiebout assumptions and implications measure concepts at the macro level, making causal arguments comparatively difficult. Rather than assess the processes associated with choice, most studies only look to see if Tiebout effects are visible. Thus, they look to a conclusion to make some judgment about the premises or the chain of events leading to that conclusion. This is known as affirming the consequent, a no-no in basic logic and reasoning in quantitative research.^a So why do we care? The conclusion that smaller municipalities provide services more efficiently than larger municipalities is an assertion supporting one aspect of the market view of public service provision. But it does so using research operationalizing variables at the macro level. This is where theory is important.

Does the fact that smaller jurisdictions provide public services more cheaply than larger jurisdictions reflect the competitive implication taken from Tiebout?

Or is it that larger municipalities tend to be more heterogeneous, economically speaking, and consequently have to spend more on welfare (i.e., appear more inefficient)? The point is, there are multiple competing explanations for a single conclusion, and there is no way to determine which is the correct one unless the level of analysis is lowered to that of the individual (the micro level). Efforts have been made to do this (see Ref.^[11] for an example), but for many research questions, there is little that can be done. One interpretation is grounded in pessimism about the nature of government. In this view, budgets grow because government has a monopoly on public service provision, creating an environment where self-interested bureaucrats have no incentive to minimize waste. Taxpayers cannot leave (the original market mechanism of mobility is removed in an area with few governments), expenditures are large, and service provision is inefficient. This is also known as the Leviathan hypothesis and an important extension of the Tiebout model from an administrative point of view.

THE LEVIATHAN HYPOTHESIS

The notion of a self-interested bureaucrat provides a microfoundation for the macrolevel assertion that

larger governments spend more than smaller governments. Some authors, employing a microfoundation, have shown that administrators do not maximize budgets^[12] or even go so far as to argue that budgets shrink.^[13] Still, many believe that it is the self-interested nature of bureaucrats working to increase annual programmatic allocations. The connection between this claim and support for Leviathan is not so clear when examining Niskanen's view. Niskanen, attempting to construct a theory of bureaucracy originating in the budgetary behavior of administrators, wrote that bureaucrats generally had budget maximizing tendencies, but that service provision was efficient. Later, he would modify his theory to include the idea that service provision was inefficient by saying that bureaucrats were no longer concerned with maximizing the budget overall,^[14] rather they were concerned with maximizing the *discretionary* budget. This means that bureaucrats are concerned with a part or *proportion* of the budget instead of the entire budget. When applying this distinction to the Leviathan hypothesis, things begin to fall apart.

Under the theory emphasizing proportions, the element explaining expanding budgets is missing because the bureaucrat is concerned with discretionary spending, not spending overall. It does not matter how big the budget is, as long as the proportion of discretionary spending increases. This is illustrated in devolutionary block grant funding (overall funding levels decrease in exchange for more discretion in terms of how to spend it). Furthermore, because service provision in the first model is efficient, there is no theoretical reason to believe that larger governments will be any more or less efficient than smaller governments in a Leviathan world. Both facets of the theory are needed to support the Leviathan hypothesis. The first version explains why budgets are big, and the second explains why there is waste. The problem with this is that the first and second views are not compatible with one another because service provision is efficient in one, but not the other. Brennan and Buchanan^[15] got around this by taking the perspective that any increase in amount of allocation results in an increase in surplus. Thus, a bureaucrat seeks to increase the allocation because the amount of money going toward discretionary spending will always increase, even if the proportion does not. Their theory still hints at the contradiction embedded in Niskanen via their concept of "surplus maximization" (p. 350), along with a host of potential problems relating to the cost of service provision. In the research, efficiency is operationalized in terms of per-capita expenditure or spending as a percentage of resident income, in most instances. This is a problem because it presupposes that the quality of service remains constant across jurisdictions. This has the effect of making low spending and low

^aIt is important to note that researchers are aware of the problem and qualify their claims to address this.

quality of service municipalities appear as the "better" service providers, when in fact service quality may be awful. The literature does a disservice to the Leviathan hypothesis by assuming away service quality and not factoring in redistributory expenditures. But Dowding, John and Biggs^[2] note that there is no redistributive element in competitive markets.

CONCLUSION

Rival explanations make it difficult to say why smaller governments provide service at cheaper rates than larger jurisdictions. This dilemma is indicative of many conclusions in the Tiebout literature because of the manner in which research is conducted. At the heart of this is the basis of causal reasoning; probably one of the most problematic facets of social science research. Even the most sophisticated econometric modeling will never exhaust explanations or account for unforeseen confounding variables, weakening the value of studies conducted with macrolevel data.

Models of the Policy Process

Thomas A. Birkland

Rockefeller College of Public Affairs and Policy, University at Albany, State University of New York, Albany, New York, U.S.A.

INTRODUCTION

The simplest definition of the term “public policy” is “the things government chooses to do or not do.” This very simple definition certainly raises more questions than it answers. How is public policy made? Who participates, inside and outside of government, to decide whether government should or should not act? Current models of the policy process seek to address these questions.

Since policy studies began as a distinct endeavor in the 1960s, two major categories of policy studies have emerged. First, the policy science and policy analysis tradition retains considerable influence and value in the study and practice of policy making.^[1,2] This research tradition is rooted in the analytic tradition that prizes doing “the greatest good for the greatest number” of people in a society. Policy analysis often considers whether a particular policy proposal will yield net societal benefits (although the definition of what constitutes a “societal benefit” is open to interpretation). A major critique of this tradition is that it focuses too much on the economic aspects of policies without admitting the complexity of politics in policy making.^[3] Policy process theories seek to understand how various elements of the sociopolitical environment interact with the structure and institutions of government to yield a set of policies. These theories are much more focused on the *politics* of policy, i.e., on the “who gets what, when and how” dimensions of politics famously outlined by Lasswell.^[4]

EARLY THEORIES OF THE POLICY PROCESS

In 1965, Easton^[5] conceived of politics and policy making as a *system* that contains inputs, outputs, and feedback. In Easton’s systems model, policies are the product of inputs, such as public demands. The system takes in these inputs, which are influenced by features of the policy environment, and then produces, as outputs, policies. Policies are laws, rules, and other authoritative statements of what government does or has chosen not to do. Thus systems models view policy as the product of many influences inside and outside of government (Fig. 1).

Systems models help isolate the key elements of policy making, but have traditionally left the workings of the system—the “black box”—underspecified. The challenge for social scientists has come in opening up this box to understand how groups, political parties, the public, and elected and appointed government officials work to promote or oppose public policies.

Similar to the input–output model is the classic “how a bill becomes a law” model. This model is an idealized process model of how the process works in Congress. It fails to extend on the basic constitutional and institutional rules to explain how or why particular ideas are translated into laws while others are rejected. It is therefore not a useful model for understanding the policy process overall.

The Stages Model of Policy Making

The “stages” or “textbook” model of the policy process was, for many years, the preeminent model. In the stages model, policy making proceeds in stages, from *issue emergence* and agenda setting to *implementation* and then to *evaluation* and *feedback* (Fig. 2), and shares many features of the systems model.

A main critique of this model is that it is advanced as a one-way model, in which the stages happen in order.^[6,7] In reality, policies are sometimes made without going through each step: some policies are quietly advanced without raising high on the agenda, and, in many cases, policies are not evaluated. In addition, the boundaries between stages of the policy process have never been particularly clear, when the stages are sometimes overlapping or intertwined, such as when implementation of a new policy causes problems to rise on the agenda to a level not seen during the agenda-setting phase. Still, the stages model has long helped social scientists to organize research around each stage of the process,^[8] such as agenda setting^[9–12] and implementation.^[13–15]

MODERN THEORIES OF THE POLICY PROCESS

As scholars realized that policy making is more complex than the stages model suggests, researchers

The policy making environment

Fig. 1 A simplified input–output model of the political and policy system.

have developed increasingly sophisticated models of policy making. These theories include Kingdon's^[16] “streams” metaphor of public policy, Sabatier's Advocacy Coalition Framework,^[17] and Baumgartner and Jones's^[18] “punctuated equilibrium” model of agenda and policy processes.

Kingdon's Streams Metaphor

Kingdon built his idea of the “streams metaphor” by building on Cohen et al.'s^[19] description of decision making in complex organizations. Kingdon argues that policy issues gain agenda status and alternative solutions are selected when elements of three “streams” come together. Each of these three streams contains various individuals, groups, agencies, and institutions that are involved in the policy-making process. One stream encompasses the state of politics and public opinion (the *political stream*). A second stream contains the potential solutions to a problem (the *policy stream*). The third, the *problem stream*, encompasses the attributes of a problem and whether it is getting better or worse, whether it has suddenly sprung into public and elite (i.e., the key participants') consciousness through a focusing event, and whether it is solvable with the alternatives available in the policy stream.

Within any particular problem area, these streams run parallel and somewhat independently of each other in a policy area or domain until something happens to

cause one or more of the streams to meet in a “window of opportunity” for policy change. That trigger can be a change in our understanding of the problem, a change in the political stream that is favorable to policy change, a change in our understanding of the solvability of the problem given current solutions, or a focusing event that draws attention to a problem and helps open a window of opportunity. But the opening of the window does not guarantee that policy change will occur.

Kingdon provides a rich and multilayered description of policy making, from the early acceptance of new ideas about public problems to the active considerations of solutions as new public policy. However, one shortcoming of this model is that it does not describe the policy process beyond the opening of the window of opportunity.

The Advocacy Coalition Framework

Sabatier's Advocacy Coalition Framework (ACF) explicitly addresses two important features of the policy process: the role of groups and the importance of knowledge and learning in policy making. The pluralist tradition in political science argues that policy is made in a process of group competition. Sabatier understands, however, that dozens of groups working independently are unlikely to have as much power as they would have if they came together in larger groupings called *advocacy coalitions*.

Fig. 2 The stages or textbook model of the policy process.

In the ACF, two to four advocacy coalitions typically form in a particular policy domain when groups coalesce around a shared set of values and beliefs. These coalitions engage in policy debate and compete and compromise with other coalitions. Some actors, called “policy brokers,” mediate competition between coalitions because the brokers are seeking particular policy outcomes or because they have an interest in promoting political harmony. Compromise is more likely when policies arise that do not threaten the advocacy coalitions’ core beliefs and values. Policy change is much less likely if polarization of advocacy coalitions is so great that there is no room for compromise in groups’ belief systems.

In the ACF, policy making is influenced both by “relatively stable” system parameters and by “dynamic (system) events,” with the interaction between the two promoting or inhibiting policy making. The stable parameters include the basic attributes of the problem area, the basic distribution of natural resources in the society, the fundamental cultural values and social structure, and the basic legal structure, which, in the United States, is the constitutional framework and judicial norms.

The dynamic features of the system include changes in socioeconomic conditions and technology, changes in systemic governing coalitions (partisan balance in the legislative or the executive branch, for example), and policy decisions and impacts from other subsystems. Change in the governing coalition corresponds to one example of change in the political stream in Kingdon’s model, while changes in socioeconomic and technological conditions influence the problem and policy streams. The activities of other subsystems can influence the policy, politics, and problem streams as their activities spill over into other policy domains. Like the streams metaphor, Sabatier’s ACF encompasses a variety of individual and institutional actors, and it views policy making as a process over years or decades. The ACF also considers the mechanisms for policy change (not simply the possibility for change, as in the streams metaphor) and more consciously encompasses the influence of implementation and feedback on the system.

Punctuated Equilibrium

Baumgartner and Jones borrow the concept of “punctuated equilibrium” from evolutionary biology to describe the policy process. They argue that the balance of political power between groups of interests remains relatively stable over long periods of time, punctuated by relatively sudden shifts in public understandings of problems and in the balance of power of the groups seeking to fight entrenched interests.

Key to their theory of equilibrium is the idea of the *policy monopoly*, which corresponds with the idea of policy subsystems. A policy monopoly is a fairly concentrated, closed system of the most important actors in policy making. Such a monopoly has an interest in keeping policy making closed because it benefits the interests of those in the monopoly and keeps policy making under some measure of control. Under the older “iron triangle” conception of groups in the policy process, this system will remain quite closed and quite stable for a long time. But Baumgartner and Jones argue that there are instances where the “equilibrium” maintained by policy monopolies will break down, greater and more critical attention to issues will follow, and rapid policy change will be the more immediate result. The policy monopolies themselves can break down or at least become more open-issue networks.

How do policy monopolies and their dominant construction of problems break down? First, greater media attention to an issue can begin to break open policy monopolies. Media attention to issues can grow when a small, but compelling or influential, group of people calls for change, to which other members of the policy community do not effectively respond. Baumgartner and Jones use the breakdown of the nuclear power monopoly to illustrate the effect of greater attention on a problem: in a mere 12 years, this domain was completely reshaped by the greater attention paid to the safety and constant problems that accompanied nuclear power.

This example illustrates how Baumgartner and Jones found that increased attention to a problem usually means greater *negative* attention to it. In this way, the “policy image” of various issues and policies can change. In the nuclear power case, the increased scrutiny of the industry began to break down the image of nuclear power as “the peaceful atom” creating power “too cheap to meter” to an image of danger and expense. This negative image was further re-enforced by the accident at the Three Mile Island nuclear plant in Pennsylvania in 1979.

Policy monopolies also break down as groups that seek access *to* and change *in* the policy-making process go “venue shopping” to find the best venue in which to press their claims. The media are one venue, and groups can seek to gain access to the courts or other units of government to gain access to policy debate. The reform of the congressional committee system and, most importantly, the increasing autonomy of subcommittees starting in the early 1970s have led to a greater number of venues in Congress for groups to find a sympathetic ear to influence policy making.

An important aspect of this way of thinking about policy is the long periods of stability followed by rapid change, and followed again by long periods of stability. In this way, Baumgartner and Jones argue that policy

change is not merely incremental and not always a state of constant flux: rather, policy remains stable, followed by a period of rapid change, then stability again, in sort of an S-shaped curve.

CONCLUSION

No one model of the policy process has yet been developed that can fully explain all the nuances and intricacies of the policy process. In addition, it is likely that the very complexity of politics and society will make a universal theory of the policy process impossible to achieve. But work continues on validating and improving on the models described in this article, with the goal of developing improved models to help us understand why public policy is or is not made.

Models, Types and Attributes of

Jeffrey A. Weber

*Department of Political Science, East Stroudsburg University,
East Stroudsburg, Pennsylvania, U.S.A.*

INTRODUCTION

The term “model” suffers from numerous definitions that are often contradictory. Public administration and public policy, similar to social science, has adopted a wide variety of models: game models, trend models, probability models, casual models, network models, path models, and simulation models, to name but a few. Often, the term model refers to a representation of a specific set of relationships that are able to be empirically tested and provide some predictive value. Many times the term model is used interchangeably with theory.^[1]

Despite a wide variety of usages, the term model is separate and distinct from the term theory and should not be considered the same. A model is descriptive, while a theory is an explanation. In other words, a model does not answer the question “why” something occurs, while a theory provides a “why.” A model is a rendering of the specific events that comprise a phenomenon or a portion of a phenomenon. While a theory provides not only the events but also an explanation.

DEFINITION OF A MODEL

The many and varied uses of the term “model” have caused confusion in several fields. Therefore, some sense of order out of this confused state of affairs needs to be established. In order to clearly delineate a model from a theory, a model is defined.

A description which serves as an observable representation of a phenomenon or a portion of a phenomenon, which may be derived from a theory, or serve as a basis for the development of a theory.

This definition recognizes the descriptive nature of a model. Because a model is descriptive, its components are observable, while a theory is abstract, and its constructs are not observable. Furthermore, a theory serves to explain phenomena or phenomenon depending on the type of theory, but a model describes a phenomenon or a portion of a phenomenon. As such, it is possible to build a model from some of the constructs and their respective variables that comprise a

theory. Furthermore, a model could begin with variables that are later grouped into constructs, which, in turn, become the basis for the development of a theory.

Similar to a theory, models can be divided into different types. While theories are divided into a typology that reflects a theory’s scale and generalizability, a model’s type reflects its descriptive elements.

TYPES OF MODELS

Though there are no agreed upon typology or categorization of models, it is possible to discern from the descriptive elements of models four basic types:^[1] Object Models, Quantitative Models, Simulation Models, and Behavioral Models.

Object Models

An object model is a physical representation of an object. The most common version of this type of model would be a model car, plane, or ship that someone would assemble from a kit. When fully assembled, the model is typically a scaled representation of a larger object.

In public policy analysis, the variables in the model are depicted as scaled representations of the full-size objects. The interrelationships between the variables can be visually seen in the object, and then scaled measurements can be taken.

An example would be an architectural model of a community area, which could be used to help guide the implementation of a proposed community revitalization project. The model could be used to ensure proper infrastructure support, such as location and width of roads to support traffic patterns. Additionally, the model could be used to ensure fulfillment of all zoning ordinances.

Another example of an object model is found in the space policy arena. In determining the feasibility of landers and rovers on Mars, scaled models of the Martian surface and the rovers and landers were constructed. These object models permitted testing to be accomplished for feasibility and cost-benefit studies.

Quantitative Models

Quantitative models are some of the most popular types of analysis models. In quantitative models, the variables are depicted as numbers, and interrelationships between them are shown as mathematical formulas. Quantitative models are used in public policy analysis to model the interaction of a few variables. Examples can be found in most revenue or expenditure forecast models.

Simulation Models

A simulation model depicts the action of a phenomenon in a sensory manner. The most common form of simulation models are weather models, which provide us with hourly forecasts. In weather models, the different variables that comprise the weather (air pressure, moisture, temperature, etc.) and their interrelationships are depicted in a controlled moving fashion. By taking real-time measurements of the current state of the variables, the model then depicts the action that those variables will take as they interact, which serves as the forecast.

There are two primary differences between a simulation model and a quantitative model. First, a simulation model is a combination of mathematical language and symbolic language of computer program. Second, a simulation model involves a large amount of variables with interactions that have a high degree of complexity.

Behavioral Models

Behavioral models attempt to depict the numerous variables involved in human or animal interaction. These types of models can be constructed from reality as it is occurring. In other words, the researcher watches behavior of the subjects as the subjects are going about their normal routines. From these observations, a model is constructed.

Conversely, a set of contrived situations can be constructed in order to make observations of behavior in a controlled manner. These types of situations can involve social or group interactions within the context of a real situation. Or, situations and roles can be contrived that are isomorphic to reality.

ATTRIBUTES OF MODELS

Similar to a theory, a model has certain attributes. Boundaries are the first attribute of a model and, similar to a theory, a model's boundaries define the temporal and spatial characteristics. The temporal characteristics of a model refer to the time period depicted by the model. For example, an object model may depict a past event as an historical recreation, or may be used in a future sense, as here is what an object will look like. Spatial boundaries define the physical shape and dimensions of the model. The idea of a model having a shape and physical dimension is relatively easy to conceive for an Object model, but for a Quantitative or Behavioral model, it is a little difficult. An example for a Behavioral model would be the physical dimensions of where the role playing is occurring or the test group is being examined.

Variables are the second attribute of a model and are sensory entities. In other words, a variable is a component of a construct that has the quality of being present, or may be present in degree, as sensed by one or more of the five senses.^[2] Additionally, variables can be an attribute of a construct (previously defined) that is always present as a part of the construct. In other words, the variable is a part of the construct's identity. Conversely, a variable may be an attribute that is sometimes present, and if it is present, it exists in various degrees.

Interrelationships are the third and final attribute of a model. The interrelationships found in a model are more specific and detailed than those found in a theory.^[3] These interrelationships will depict some form of association or influence among the variables. Some may depict the influence as casual, while others may depict it as a possible association but not specify a cause-and-effect-type linkage.

Moral Development Theory

Richard D. White Jr.

Public Administration Institute, Louisiana State University,
Baton Rouge, Louisiana, U.S.A.

INTRODUCTION

Moral development theory attempts to answer a fundamental question. How do people decide what is right and wrong? A branch of the philosophical study of ethics, or metaethics, moral development theory argues that all people in all cultures pass sequentially, invariantly, and irreversibly from lower to higher stages of moral reasoning; moral judgment is defined according to how an individual reasons rather than according to what the individual thinks; and values and ethics are developed as a result of the interaction between the person and the environment.^[1] In its most basic form, the theory rejects relativism and regards the affective domain as unimportant and irrelevant. However, the creator of the modern moral development paradigm, Lawrence Kohlberg (1927–1987), goes beyond the simple value-free framework and argues moral judgment *is* moral; it is not merely the application of cognitive skills or intelligence to moral questions or situations. Kohlberg insists on a close relationship between the level of moral development and procedural justice to insure a moral baseline for his body of theory. To him, moral development theory is grounded upon a Rawlsian concept of morality about how humans cooperate, how they manage conflicts, and what concepts of fairness they adopt.^[2]

Modern moral development theory is rooted deeply in the works of Piaget,^[3] McDougall,^[4] Baldwin,^[5] Mead,^[6] and Dewey.^[7] The theory owes much to Piaget, who sees the child as an active participant in the development of a moral philosophy through interaction with the environment. Piaget departs from psychoanalytic and social learning theories that view the child as a passive product of the environment and rejects the belief that children simply learn the norms of a group. Instead, a child autonomously develops through struggles to arrive at fair solutions.^[3,8] In the first of two stages, an impulse-governed, egocentric *morality of constraint* governs the child. Through interactions with other children, the child matures, de-centers, and enters a second, higher *morality of cooperation* stage. Intentionality, the child's ability to take into account intentions or motives in making judgments of praise or blame, is an important determinant. Piaget illustrates intentionality when he asks a

child to decide who is naughtiest: a child who knocks over 15 cups accidentally or a child who breaks one cup in an act of disobedience. Typically, children under nine base their judgment on the extent of material damage, while older children recognize the moral relevance of the intentions of the actor.^[3] Piaget assumes that moral development is innate, invariant, hierarchical, and culturally universal.

Also focusing on child behavior, Baldwin sees moral development as evolutionary. An infant first learns to distinguish persons from objects in the *projective* stage. Next, the child develops a sense of self in the *subjective* stage. In this stage, children visualize themselves as people among other people but as possessed of special feelings that they cannot observe in others. Finally, in the *ejective* stage, children develop a sense of otherness and think of others as having those same feelings they can detect in themselves.

From Dewey, Kohlberg derives his three levels of development (preconventional, conventional, and postconventional), and from Mead, the cognitive basis for role taking. While Piaget's theory includes elements of emotion and the affective domain, Kohlberg follows the exclusively cognitive approaches of Mead and Baldwin. Another early influence is McDougall, who describes moral development as a four-stage process: in the first, only pain and pleasure modify instinctive behavior; in the second, reward and punishment of society modify instinctive behavior; in the third, anticipation of social praise and blame control moral conduct; and in the fourth, man acts in a way that appears right regardless of praise or blame.^[4]

THE KOHLBERG MODEL OF MORAL DEVELOPMENT

Synthesizing the work of the earlier theorists, Kohlberg offers three levels of moral judgment, with each level representing a progressive shift in an individual's moral development (see Table 1). Each of the three levels contains two distinct stages. At the lowest, preconventional level, moral values reside in external happenings or physical needs rather than in persons and standards. The preconventional level is characteristic of young children who worry only about being caught

Table 1 Kohlberg's stages of moral development

Level	Self-perception	Stage	Value of life
Preconventional	Outside group	1. Obey or pay, punishment orientation. 2. Self (and sometimes others') satisfaction.	1. Confused with physical objects. 2. Instrumental to needs of possessor.
Conventional	Inside group	3. Win others' approval by helping them. 4. Law-and-order mentality; doing one's duty.	3. Based on empathy of family. 4. Based on legal rights and duties.
Postconventional	Above group	5. Respect individual rights; accept critically examined values. 6. Act with logically developed and universally accepted principles.	5. Life is universal human right. 6. Life is sacred.

and punished.^[1] In other words, *if I want it and I get it, then it is right*. Within the preconventional level are Stages One and Two. Stage One emphasizes an egocentric obeisance to superior power and a trouble-avoiding attitude. Stage Two represents an orientation whereby right action instrumentally satisfies one's own, and occasionally others, needs. Stage Two individuals conform only to obtain rewards, confuse the value of human life with the value of physical objects, and see human life solely as an instrument to their own satisfaction.

At the middle, conventional level, an individual recognizes a sense of responsibility to the group, the need for maintaining order, and admits that right is based on social inclusion or law. Within the conventional level are Stages Three and Four. Stage Three is an orientation toward pleasing others, avoiding disapproval of family members, and conforming to majority stereotypical images. Stage Four is an orientation toward doing one's duty, respecting authority, maintaining the given social order, and conforming to avoid censure by legitimate authorities and resultant guilt.

At the highest, postconventional level, an individual develops moral autonomy and acts according to universal ethical principles. Within the postconventional level are Stages Five and Six. Stage Five individuals conform to maintain the respect of the impartial spectator judging in terms of community welfare. Life is a universal human right. Stage Six individuals conform to avoid self-condemnation, with mutual trust, respect, and conscience directing their actions. Stage Six is an orientation to conscience or principles, not only to ordained social rules but also to principles of choice appealing to logical universality and consistency. Human life is sacred.^[9]

THE DEFINING ISSUES TEST

In 1971, the empirical application of Kohlberg's model expanded greatly when James Rest introduced the

Defining Issues Test (DIT). Responding to the need for a practical, validated, and objective method for assessing moral judgment, the DIT is a multiple-choice instrument that enables researchers to generate a quantified appraisal. Having been administered in thousands of studies, the DIT places Kohlberg's moral development theory on a more solid empirical footing.^[10] The test presents a subject with six moral dilemmas followed by a list of questions that a person considers in choosing what ought to be done in each dilemma. The subject considers each dilemma and ranks the importance of statements typical of the different stages of moral reasoning. The dilemmas comprise a variety of social moral issues, including three from Kohlberg's original moral judgment interview. Grading of the DIT yields a continuous number, the *P* index, standing for "principled morality," and represents a percentage that each subject places on Kohlberg's Stages Five and Six.^[10]

P index scores do not indicate a subject's worth as a person, or his loyalty, kindness, or sociability. Instead, the scores draw upon the conceptual frameworks by which a subject analyzes a social-moral problem and judges the proper course of action. According to Rest, the DIT assumes that people at different points of development explain moral dilemmas differently and have different perceptions about what is right and fair in a situation. While Rest supports Kohlberg's general theory of sequential moral development, he does not accept the rigid scheme of six distinct stages. Rest rejects the single-stage concept and suggests that people fluctuate within a developmental range.

CRITICISM OF MORAL DEVELOPMENT THEORY

While an established paradigm, Kohlberg's theory remains controversial. A serious criticism is that moral development theory does not represent how people make actual decisions when they face real-life ethical dilemmas. People typically hold one set of beliefs, but

these beliefs are different from the actual rules they adopt in practice, especially in situations where the risks are high. In response, Kohlberg argues a strong relationship between the way people think about moral dilemmas and how they actually act. Two meta-reviews of more than 100 studies using the DIT found two-thirds of the studies reporting a significant correlation between moral development level and behavior. Studies showing a correlation cover a wide range of behaviors, including juvenile delinquency rates, drug and alcohol abuse, spouse, conscientious objection, and opinions on abortion.^[11,12]

Another significant criticism is that the Kohlbergian model has an inherent sex bias. Carol Gilligan faults Kohlberg for neglecting a woman's perspective, erroneously suggesting that women are morally deficient because of their tendency to understand moral issues in emotional and personal ways, and assuming the impersonal male justice perspective over the female care perspective.^[13] Despite Gilligan's criticism, most moral development studies find sex differences to be trivial, with the preponderance of recent research suggesting that males and females base their reasoning on a combination of justice and care. Several DIT studies find no statistical difference in moral development level based on gender, while one meta-analysis of 56 moral development studies administered to over 6000 male and female subjects reports that at every age and educational level, females scored significantly *higher* than males.^[14]

Critics also argue the moral stage model gives no evidence for sequentiality, claim empirical research fails to confirm stage development, and call for wholesale abandonment of the theory. Others fault Kohlberg for overemphasizing higher postconventional stages and justice-based ethical reasoning, while underrating some equally worthy values at the lower stages, emphasizing the cognitive aspects of moral reasoning at the expense of important affective dimensions, and focusing solely on Western ideology and creating a cultural bias. Kohlberg and his followers devote considerable effort to counter the varied criticisms. Taking almost a decade to prepare, Kohlberg published a detailed, three-volume defense of moral development theory.^[15]

MORAL DEVELOPMENT RESEARCH AND PUBLIC POLICY

Public policy scholars turn to moral development theory to explain the ethical behavior of public officials, compare the moral development levels of public servants with other segments of society and between cultures, and correlate moral development levels with public policy variables. Primarily using the DIT, studies find moral development scores to be associated with political ideology and views toward the Equal

Rights Amendment, nuclear arms race, environmental ethical reasoning, and capital punishment.^[16,17]

Moral development theory provides insights that are useful for public managers who need to recognize that different levels of moral judgment exist and that situational variables such as education, age, life experience, and degree of autonomy may affect an individual's level of moral development. Public managers should recognize that most adults and institutions, including legislatures, make moral judgment decisions predominately at the conventional, Stage Four level. Empirical research finds little evidence of the political system employing postconventional, principled moral judgment.

A significant implementation of Kohlberg's moral development framework in the public policy arena uses a specially designed instrument, the Stewart-Sprinthall Management Survey (SSMS). The instrument features ethical dilemmas structurally similar to the DIT but comprises scenarios more typical to those experienced by public servants as they perform their professional duties. Applying the instrument to a large number of public managers, SSMS researchers confirm that most respondents place an emphasis on Kohlberg's conventional, Stage Four of moral development, suggesting that public officials tend to make ethical decisions primarily in terms of law and agency rules and avoid individual discretion.^[18,19]

An area where moral development theory has significant potential within the public policy arena is pedagogical. Kohlberg, Dewey, and Piaget argue a strong linkage between education and moral development and emphasize that the educational bedrock is to identify and act upon moral principles. Research provides evidence that ethics education intervention can advance a subject's moral development. A meta-review of 55 DIT studies of ethics courses concludes that programs designed to improve moral judgment through intervention treatments of about 3 to 12 weeks produce optimal improvements between pretest and posttest average scores. Pedagogical methods featuring peer discussion of moral dilemmas show positive, consistent improvement in DIT results, while discipline-oriented, information-laden courses on traditional academic topics seem to be less effective.^[10] The need for improved ethics education for public servants is well documented. Stressing the need for ethics training and education, scholars see the potential value of moral development theory in the public policy classroom and propose the creation of formal, but practical, educational programs that nourish moral reasoning and ethical behavior. They call for a seamless, context-relevant, and continuous connection between graduate and in-service professional training.^[19]

The Kohlberg model also enhances the understanding of the consequences of designing public

organizations in different ways and the consequences of staffing organizations with employees of differing moral development levels. Ideally, it would be desirable for all people to function at the highest level. However, the employment of individuals who exhibit the highest postconventional moral judgment may not be best for the organization. Postconventional thinkers are individuals who are highly autonomous, question orders, and resist performing duties that violate their own high standards. The military provides an extreme but illustrative example.^[9] Can a military unit be effective if soldiers question the morality of war and resist the lawful orders of their superiors? Can an assembly line operate efficiently if workers exhibit autonomous behavior? Individuals who make moral decisions at the conventional level may be desired for the traditional hierarchical, industrial organization, while postconventional individuals may be desired for the creative organization structured in a less-rigid hierarchy.

Motivation

Evan M. Berman

Public Administration Institute, Louisiana State University, Baton Rouge, Louisiana, U.S.A.

INTRODUCTION

The term “motivation” is defined as that which prompts a person to act in a certain way, as in the statement: “Tom is motivated to make a lot of money.” The term is also used to characterize the level of commitment that describes a person’s actions toward a goal, such as “Mary is not motivated to do this work.” A consensus exists that motivation refers to a person’s internal state. Thus, the frequently used expression “I am motivating Joe” is linguistically incorrect. Managers cannot give motivation to others or do motivation to someone. They can only increase or decrease the level of motivation that is already present in others. The term “motivation” is most accurately used in connection with a specific task or goal, such as in the above expression concerning Mary.

Motivation has been the subject of many studies. The purpose of early clinical studies has typically been to identify the motivations of workers. This is of considerable interest to managers, because highly motivated workers are thought to be more productive, as their energies are better aligned with the needs or goals of their organization. Recent managerial studies investigate management strategies for better aligning the goals of workers with those of the organization.

The terms energy (vitality) and motivation are related but distinct. Motivation is that which prompts a person to act in a certain way, whereas energy is the amount of effort that is available to a person for acting in a certain way. It is widely believed that motivation brings forth energy, and also that healthy adults have sufficient energy to accomplish their goals; hence, the lack of energy is typically interpreted as indicating insufficient motivation to achieve some goal or complete a task. However, it should be noted that medical conditions (such as the flu or clinical depression, which recently is increasingly diagnosed among U.S. adults and adolescents), and exposure to prolonged stress (resulting in, for example, “burnout”) may produce a (temporary) vitality deficit. In these instances, managers have an interest in assisting workers to restore their vitality to normal levels, while they direct human energy, at whatever level it occurs, toward the purposes of the organization.

THE MOTIVATION OF WORKERS: ABRAHAM MASLOW

Human beings have a complex set of needs that motivate them. The purpose of Maslow’s^[1] classic study was to identify these needs. According to Maslow, the needs of U.S. adults are of hierarchical nature, shown in [Fig. 1](#). The general ideas are as follows: 1) adults are motivated to satisfy their needs; 2) an order exists among their needs, and lower-order needs must be satisfied before higher-order needs can be satisfied; and 3) lower-order needs that have been satisfied no longer provide motivation for workers, although they would if workers fall back to that level.

Maslow’s hierarchy of needs has become widely popularized, in part, because it reduces the complexity of human motivation to a few manageable categories, described below. However, a few observations can be made. First, later studies suggest that the hierarchical order is not always replicated for all cultures (for example, some cultures view social belonging as a higher-order need than self-esteem). Rather than focusing on the order, it is useful to focus on the categories of needs. Second, the categories are broad, and managers cannot know exactly what motivates workers. This is in part because workers may not always be clear about what motivates them, and because some workers may guard against telling managers truthfully. Sharing what motivates workers with managers is to provide managers with “hot buttons” that can be used at any time against workers; it is akin to handing managers a loaded gun. The implication is that managers and their organizations must provide a wide range of conditions that enhance the motivation of workers; although managers may not know what motivates each worker, a diverse package is likely to contain sufficient elements to ensure that the goals of each worker are aligned with those of the organization. Third, managers and their organizations need to “update” the package of conditions that appeal to workers’ motivations, because expectations and conditions are different today than in the 1950s. Motivations may also vary across ethnic and demographic groupings.

Maslow’s motivational needs are discussed as follows. Traditionally, the motivational need of “physiological well-being” involves having adequate food and shelter, whereas the security need is met by attaining a

Fig. 1 Maslow's hierarchy of needs.

measure of job and retirement security. However, organizations have increasingly found ways to go beyond these motivational needs: some employers now provide exercise facilities, and they encourage workers to stop smoking. The rationale is that healthy workers are aligned with the organizational need for controlling health care and other employment costs. Also, many employers have revisited their retirement and health benefits to ensure that they are competitive and meet workers' needs, thereby ensuring the relevancy of these conditions as motivators. Some employers also have anti-workplace-violence programs, which may address security needs. Although it is unclear what percentage of workers regard any of these features as important job motivators, it may be a primary or secondary motivator for some, and a broad package of benefits is likely to contain some features that motivate many people. For example, retirement benefits are important for middle age and older workers.

It may be noted that physiological and security needs often are associated with money (salary and benefits). Studies show that money is a powerful motivator for workers with low salaries who struggle to pay their bills (that is, trying to meet their minimum levels of physiological well-being and security); few workers accept jobs when salaries are insufficient for that purpose. However, the importance of money tapers off among workers who regard themselves as being financially comfortable; for them, money is but one of several motivators, described below. For example, professional workers may feel that challenging work assignments are at least as important as money. These findings generally confirm that physiological well-being is a lower-order need. For workers who have generally satisfied this need, money, security, and physiological needs are necessary but insufficient to ensure a high level of motivation. For some workers, money remains an important motivator because of the ability to use money in satisfying other needs, such as status (discussed below), but not because of the need to meet basic physiological and security needs.

Some people have a need for friendly and close interpersonal relationships. People with a strong need for social belonging are motivated by harmonious working relationships. Coming to work is akin to being among friends; working with others is similar to enjoying the company of friends. They are also motivated to maintain harmonious working relationships. Strained personal relationships are demotivating, and such a workplace leaves a void of social belonging. In recent years, managers have been encouraged to increase a sense of teamwork and cooperation among employees, to ensure smooth working relationships, and to provide an opportunity for workers to meet their needs for social belonging. It is quite unclear what percentage of workers regard social belonging as an important need, whether managers are successful at providing conditions for social belonging, and whether workers experience sufficient social belonging in the workplace. A consensus exists, however, that employee picnics, casual Fridays, Christmas parties, and vague affirmations about the importance of teamwork are insufficient to satisfy the need for social belonging. McClelland^[2] also believes that affiliation is a basic human need, along with power and achievement (below). However, he notes that while a need for harmonious working relations is positive, too much need for such relationships can be negative, because it may prohibit open dialogue about performance, which may threaten the harmony of close interpersonal relationships.

Self-esteem is generally defined as holding oneself in high regard. High self-esteem is associated with getting recognition (praise) and positive feedback about one's actions, as well as positive self-talk. It should be noted that workers with a high need for self-esteem need not also have a strong need for social belonging; periodic praise from others about one's job performance may suffice. Management consultants frequently ask at seminars whether attendees (workers) perceive that they receive adequate recognition for what they do; typically, fewer than 10 or 20% of workers are reported to say that they do. This fact is disturbing, because it costs very little to recognize someone. An implication for managers is to find ongoing, new ways to recognize staff. Managers may believe that periodic salary raises or promotions suffice, but praise is more effective when it is immediate and directed toward a specific event. In this regard, some managers persistently provide praise and seek recognition for their staff from the organization.

Self-actualization occurs when workers are able to grow through their work. Although Maslow discusses self-actualization in terms of identity ("work become part of one's identity"), others discuss it as the need for achievement in ways that contribute to society and are consistent with one's need to develop. Achievement

(or accomplishment) is often an important human motivator. In this regard, the development and implementation of public programs is often an important achievement that allows for self-actualization among those managers who seek to improve society in this manner and relish the opportunity of developing their intellectual and political skills in new and oftentimes unpredictable ways, as they thrust themselves into the public realm. People with a high level of creativity are thought to have a high demand for such activities, and managers can enhance their motivation by providing challenging opportunities for achievement.

FURTHER PERSPECTIVES

Although Maslow's work identifies some of the most important motivating needs, other authors have identified others and provided important clarifications. David McClelland^[2] considers power to be an important source. The need for power is defined as the need to direct others and be in control of one's environment and destiny. Studies show that managers and executives often have a high need for power, far stronger than the need for social belonging or achievement. McClelland distinguishes between a positive and negative need for power. A positive need exists when managers want to accumulate power in order to improve society, including the conditions of their workers. A negative need for power exists when managers are driven by a need for personal dominance over others. Dictatorial behavior, including managers who are preoccupied with establishing and securing their fiefdom, is said to be motivated by a negative need for power. To satisfy the need for power, organizations typically reward managers with symbols and tools of power, such as the corner offices and higher salaries.

Herzberg's two-factor theory^[3] complements the above sources of motivation by distinguishing between motivators and demotivators (also called "hygiene factors"). Herzberg generally agrees that achievement, recognition, responsibility, and personal growth are important sources of motivation, but his empirical research shows that for a minority of workers, these are also sources of job dissatisfaction. For example, it may be that although self-actualization is an important motivator for some workers, it is not a motivator for all workers, and that these latter workers become demotivated when self-actualization is forced upon them. A lack of goal alignment occurs between the organization and the worker. Thus, although organizations generally need to provide a broad range of motivators, the way in which they couple them with individual workers may require some individual considerations: "one size" does not fit all (see "Psychological Contracts" below).

Herzberg also found that some factors are generally only regarded as demotivators that diminish worker motivation. In this regard, a majority of workers feel that policies, procedures, rules, and regulations demotivate them. For some workers, policies and administration do not demotivate, but they seldom, if ever, motivate. It is difficult to imagine being motivated by the prospect of dealing with rules and regulations, although they may turn some workers "on." Working conditions and relationships with supervisors also are viewed as demotivators. Good working conditions seldom motivate workers, but bad working conditions demotivate. The demotivational aspect of relationships with supervisors might be attributed to the fact that few people enjoy being subjected to power and controls, and being cajoled by others, no matter how considerately and tactfully this is done.

Herzberg also found that though salary and relationships with peers have mixed and moderate effects; they are moderate sources of motivation for some workers (compared with achievement, recognition, and responsibility) and moderate demotivators for others (compared to policy and administration or relationships with supervisors). Security and status were of negligible importance as either motivator or demotivator. Empirically, these factors seemed to matter little to most workers. (This is consistent with the above, when most workers already have their security needs met, when affiliation is assumed to be of moderate importance as a motivator to Americans who have socialized preferences for individualism, and when salary and status are viewed as derived from other needs, such as power.)

Victor Vroom^[4] notes that the way in which work is structured also affects motivation. Specifically, goals increase motivation when the reward associated with goal attainment is valued highly by the worker, when goal attainment is viewed as feasible, and when the expected effort that it takes to achieve goals is "reasonable" in relationship to the anticipated rewards. This is called expectancy theory. Others have expanded on this. For example, Locke and Latham^[5] note that specific goals increase performance more than abstract goals, that difficult goals accepted by employees increase performance more than simple goals, and that feedback leads to higher performance than no feedback. Feedback is also mentioned by others, especially in relationship to consequences. Skinner^[6] notes that behavior is shaped by its consequences: Positive consequences (including praise) reinforce behavior, and punishment (including negative feedback) suppresses behavior.

Finally, equity theory states that motivation is affected by how workers compare and evaluate their rewards relative to others, relative to policies and current practice, and relative to their standards as to what they feel they are worth. When workers feel that

they are being underrewarded, motivation decreases. When workers feel that they are being overrewarded, motivation increases. For example, when others are perceived as getting more than their fair share, worker motivation is diminished.

The implications for managers and human resource management are clear. Organizations need to provide workers with the following: 1) competitive salaries; 2) relevant benefits that address their needs for security; 3) meaningful rewards and recognition (and distribute them in equitable ways); 4) challenging (yet, achievable) assignments with opportunities for learning and skill development; 5) friendly and cooperative workplace relations; 6) assignments that allow workers to make a meaningful contribution to society; and 7) a sense among workers that they have meaningful control over their work environment (including rewards). At the same time, organizations need to minimize the demotivating effect of rules and regulations and negative supervisory relationships. The above also suggest that although these conditions should be present, individual workers vary in their needs and operationalization of any or all of these aspects. Thus, to further increase motivation, managers may wish to identify and respond to these individual variations.

PSYCHOLOGICAL CONTRACTS

The term “psychological contract” defines the unwritten understanding that an individual has with regard to the expectations, roles, and rewards that the worker has of the organization, as well as those that the organization has of the worker. The term is of recent vintage,^[7] though the concept appears in research in the 1970s. Psychological contracts are important to clarifying the needs of workers and aligning them with those of the organization, hence, increasing worker motivation. They are a tool for managing the alignment process.

Psychological contracts are unwritten understandings between two or more parties; they are not employment contracts and are not legally binding. The penalty for violating a psychological contract is worker withdrawal, that is, demotivation. Violation also undermines trust, which then becomes a barrier in establishing future productive working relationships between parties. Psychological contracts go beyond employment contracts, which typically provide

agreements about salary, benefits, grievance procedures, and working hours. Although these are important conditions that affect motivation, they do not clarify other conditions that also, and sometimes more strongly, affect worker motivation.

A psychological contract is established through a dialogue that is typically (though not necessarily) initiated by a supervisor or coworker. The purpose of the dialog is as follows: 1) identify what another person (say, an employee) is looking to get from the working relationship; 2) test that which the other person wants to get against that which the supervisor or coworker is willing and able to give; 3) establish what the supervisor or coworkers expect to get from the employee; and 4) establish what the employee is able and willing to give the supervisor or coworker. These elements are depicted in Fig. 2. Such a dialog can identify specific needs that are motivators, distinguish realistic from unrealistic needs or expectations that then might be eliminated through subsequent discussion, and establish equity by making sure that what is being asked from others is commensurate with what employees are willing to give, and vice versa.

A psychological contract is established when both parties agree to the cells shown in Fig. 2. A good psychological contract is one in which expectations are accepted by both parties, in which expectations are specific (unambiguous), and in which expectations and commitments are balanced. Examples of elements in psychological contracts often include keeping others informed, being willing to pitch in, listening to others, not bringing certain foods into work areas, receiving recognition, receiving training, and discussing assignments. Clearly, fulfillment of such expectations can increase motivation and productivity.

Psychological contracts should also contain the understanding that as conditions change, parties may need to renegotiate their understanding. Indeed, parties will want to discuss fulfillment of psychological contract, such as when one party is believed to be “not living up” to commitments. The moment of such insight is sometimes called a “pinch point.” Parties have a “right” to bring up the psychological contract when they feel that others are violating them. Often-times, a brief conversation is sufficient to address the sources of the pinch and to rectify it by providing a solution. It should be noted that in the absence of a psychological contract, it is often more difficult to bring up matters of discord.

	Expect to Get	Expect to Give
Worker		
Supervisor / Others		

Fig. 2 Psychological contract. (As adapted from Ref.^[8].)

Through psychological contracts, managers can gain additional insight into what individual workers expect and need. Psychological contracts complement the above sources of worker motivation by identifying additional sources of motivation. They do not substitute for the above sources of motivation.

Motives and Incentives: Rethinking Budget Theory in a New Institutional Context

William Earle Klay

*Askew School of Public Administration and Policy, Florida State University,
Tallahassee, Florida, U.S.A.*

INTRODUCTION

The institutionalized processes of budgeting confront administrators with pervasive disincentives. There is no method of productivity improvement known to business managers that is not also known to public administrators. Good public managers know ways to improve productivity, but they operate within institutions that discourage it. These disincentives exist primarily because past generations of legislators wanted to control executives more than promote productivity. Distrust of the executive is deeply rooted in our legislators' institutionalized behaviors, and these behaviors shape the incentive systems for public managers.

Failure to Spend an Appropriation

Agencies take great care to ensure that appropriations are fully spent before the end of a fiscal year. In classic studies, Anton^[1] and Wildavsky^[2] found that legislators were likely to cut agencies' budgets when they failed to spend all their earlier appropriations. Agency managers rationally respond to their incentive environment—they try to spend every possible penny. If money is likely to remain at the end of a fiscal year, managers make extra efforts to spend it. Even when agencies do not have to return unused funds to the general treasury, they fear that unobligated year-end balances will raise questions as to whether their programs are overfunded.^[3]

Disincentives and Fiscal Constraints

Even revenue scarcity does not end the disincentives for saving. When their governments face revenue shortages, savings that are created by conscientious managers are often shifted to support the programs of other, less cost-conscious, managers.^[4,5] Obfuscation and other defensive strategies seem logical when budgeters most reward those who stonewall well.

Cash Flow Planning

In private business, unforeseen cost increases or revenue shortfalls can cause a severe liquidity crisis and

failure, even when long-term prospects are good. Prudent stockholders, therefore, demand that their managers maintain cash reserves or an ability to borrow cash on short notice. Public managers face similar uncertainties. Service demands or costs (e.g., petroleum products) may exceed projected levels. Even though public managers also need contingency cash reserves, their requests for reserve funds, or efforts to save and retain money in reserve, are likely to be construed as “fat” to be cut. Requesting supplemental appropriations in the middle of a budget year can endanger an executive's career. Agency managers respond by trying to request enough in their annual budget to cover some contingencies. They then must spend all that is appropriated, even if higher costs or demands do not occur, simply to get funds to cover future contingencies.

“Pay for Performance”—An Empty Promise

Governments fail to provide incentives for productivity improvement.^[6] To remedy this, legislators occasionally enact “pay-for-performance” laws. Some laws offer higher pay only for top executives, others also promise salary enhancements to lower-level employees, in return for higher levels of performance.

Unfortunately, neither the U.S. Congress nor any state legislature has yet sustained a pay-for-performance system. Institutionalized legislative distrust, accompanied by desires to free money for other political priorities, have repeatedly derailed pay-for-performance initiatives. Contino and Lorusso,^[7] for example, described how public employees who cooperated to achieve greater productivity and savings were frustrated by the sweeping of the savings from their agency. Pay-for-performance laws usually require that auditors first verify agency cost savings. Auditors, though, reflect legislators' distrust of agencies and tend to become obstacles to the implementation of pay for performance.^[8]

In 1994, the Florida legislature enacted a law that promised financial awards to workers whose agencies produced verifiable cost savings. The Department of Revenue responded by effectively using quality management and reengineering techniques. When the

agency returned approximately \$9 million to the treasury, its director sought \$100 bonuses for half the agency's employees, totaling approximately \$250,000. The legislature failed to honor its promise, authorizing no bonuses in spite of strong revenue receipts. The state's largest business magazine accused the legislature of pulling "bait-and-switch" tactics on its employees.^[9] Florida is not unique; it is typical. Its institutionalized budgeting processes are quite similar to those of other states. Making pay-for-performance work, not just once but for years to come, requires an institutional capacity for sustained commitment that seems to be lacking among legislatures. No state legislature (nor the Congress) has yet demonstrated such a capacity.

Performance Data: Feared and Ignored

Believing that legislators will use performance data to punish but not reward agencies, managers become reticent to develop or provide it. A multistate comparison found that an "underlying current" of fear inhibits the development and use of performance data.^[10] Georgia failed to create a workable performance measurement system largely because agency managers feared that the central budget office would use the data against them.^[11]

When performance data are provided, elected officials (and their staffs) often pay little heed to it. A survey found that most states (42 of 46 reporting) collect information about agency performance but few (only 13) said that they actually used such data in making decisions.^[12] The situation appears no better in local governments. A survey of 510 local governments reported that 30% of those do service efforts and accomplishments (SEA) reporting. Actively promoted by the Government Accounting Standards Board, SEA reporting is an important development in revealing a government's productivity to multiple stakeholders. Only 5% of those doing SEA reporting (a meager 1.5% of the total respondents) indicated that the data played an important role in deciding those governments' budgets.^[13]

Politics, not Productivity, the Recipe for Success

In 1966, Davis, Dempster, and Wildavsky found that senior executives in the federal government "uniformly" believed that political skills were "more important in obtaining funds than demonstration of agency efficiency."^[14] The federal budget process clearly penalized the U.S. Securities and Exchange Commission by restricting its appropriations in the years following its best productivity.^[15] Connelly and Tompkins found that the performance data submitted by agencies in Missouri

had no statistical association with the governor's recommended spending changes. They concluded that performance data were used in a "dramaturgical" manner, its gathering giving "the impression of careful reasoning and active protection of the public treasury."^[16]

Analysts often distrust the data they get from agencies and, therefore, discount it. Even when analysts accept the validity of performance data, other political factors may push the data aside. There is no indication that this situation is changing. A survey of U.S. states revealed that 47 of 50 states had adopted budgeting systems that include the submission of performance data, but few states showed any link between performance information and actual appropriations.^[17] However, numerous studies have indicated that the agencies that are the most acquisitive in their political strategies tend to receive larger budget increases.^[18]

ECONOMICS-BASED THEORY NEGLECTS INSTITUTIONAL CONTEXT OF INCENTIVES

Sadly, a half century of successive economics-based budget reforms have been undermined by psychological and sociological naiveté. For the most part, these reforms have been rooted in the assumptions of scientific/economic rationality as described by philosopher Paul Diesing.^[19] Information is central to this form of rationality.

Budget Process Reform

Seeking to make budgeting more "rational," reformers have repeatedly sought to mandate enough information to allow decisions to be made according to calculations of marginal rates of return. A succession of process-oriented reforms like planning-programming-budgeting systems and zero-based budgeting sought to empower budgeters with the "perfect knowledge" of "economic man." Foolishly, those reformers failed to heed Herbert Simon's^[20] Nobel Prize-winning warning that economic theory must recognize that "perfect knowledge" is unattainable.

Even more modest reforms such as performance budgeting have never come to grips with the fact that they quickly overwhelm decision makers with details. No budget reform to date has squarely addressed the pressures and time constraints that confront busy legislators during sessions. Equally inexplicable is the fact that no budget reform has squarely addressed the problems of incentives. Little or no attention has been given to the disincentives that discourage managers from developing the information on which economics-oriented reforms so greatly depend. Disparaging politics, rather than seeking to understand it, generations of reformers in this tradition have

ignored the institutional complexities within which incentives structures emerge and operate.

Public Choice Theory

Incentives structures are central to public choice theories. This body of economic theory has not focused on budget reform but, in providing a theoretical basis for decentralization and privatization, it has enormous implications for all aspects of public financial administration, especially information systems, contracting, auditing, and budgeting. Public choice theorists declare that public managers are self-interested, materially motivated “agents” who possess various forms of advantages over the “principals,” taxpayers, and their elected representatives (although the latter are also agents).

Information is seen as the primary advantage that agents have over principals. Principals depend on agents to provide information about policy options and performance accomplishments. Agents, however, are presumed to manipulate information to their advantage. Consequently, much of public choice theory is concerned with reducing the adverse effects of these “information asymmetries.”^[21] Public choice theory concludes that principals must constrain agents via laws and penalties, hire auditors to monitor agents’ performance, and induce agents’ behavior via incentives. A complication arises, however, in that democratic governments almost never give their agents a significant share of the economic benefits that the agents might create for society (unlike private companies in which owners can share profits with hired agents in large amounts). Government incentives are modest, often non-monetary, and symbolic.^[22,23]

Recognizing that democratic governments cannot offer substantial economic inducements to public employees, public choice theorists prefer to abandon service delivery by public employees in favor of contracting to private for-profit companies. This, they believe, will introduce economies from competition and better harness incentives by allowing private companies to freely pay managers and workers according to their performance. If companies’ employees do not embody public service norms, however, their sole incentive is to maximize profit while delivering only the minimal quality of service needed to continue to compete for further contracts. Furthermore, a system based solely on the concept of bargaining and exchange “is poorly equipped to deal with exchanges between current and future citizens.”^[23]

Professional Norms Contradict Public Choice Assumptions

According to public choice theory, public employees are agent/bureaucrats who foster and enlarge information asymmetries in their own self-interest. Yet, for

at least a century, public sector professionals have fostered a series of reforms with the objective of reducing the information asymmetries! Early in the century, organizations such as the New York Bureau of Municipal Research (which started the first public administration training program in the United States) committed themselves to overcoming information asymmetries by providing financial and performance information to multiple groups of “principals,” including the residents of poor neighborhoods who were being poorly served. In recent years, the Government Accounting Standards Board, an authoritative body of public sector professionals, has been promoting Service Efforts and Accomplishments reporting. This reporting is based on the premise that conscientious professionals are obligated to measure and report both costs and accomplishments, through financial reports, to all stakeholders including elected officials, potential bond buyers, and taxpayers. Why do many public sector professionals repeatedly seek to remedy information asymmetries? There is no indication that public managers who do so will benefit economically. Their motives, therefore, cannot be explained by economics-based theory.

AN INSTITUTIONAL PERSPECTIVE ON MOTIVATION AND INCENTIVES

An “institutional perspective” acknowledges that motivation is multidimensional, shaped within complex social settings. The motives of public sector professionals who strive to remedy information asymmetries can only be understood in their institutional context. The legitimacy of all professions (to varying degrees) rests on their having a knowledge base rooted in science, so scientists’ belief in the free flow of information has become inherent to most, if not all, professions. The norm of stewardship—emphasizing that one’s personal worth is measured by how well others are served—is also taught in the socializing processes of public administrators (although perhaps not as well nor as explicitly as it should be). A commitment to the disclosure of information in the context of service to others, not economic self-interest, explains why public sector professionals have repeatedly sought to promote reforms that reduce information asymmetries.

Unfortunately, public administrators themselves often fail to take into account the institutional context of legislators. When the budget staff of the State of Texas promoted performance budgeting, they hoped it would make the legislative process more analytical. They were disappointed when legislators’ behaviors did not change appreciably.^[10] Even careerists, it seems, have repeatedly failed to understand the institutional nature of legislatures.

Acknowledge the Institutional Nature of Legislatures

Legislatures are venerable institutions with powerful socialization processes that date back to the Magna Carta and the American Revolution. Legislatures socialize their members into a different form of rationality—not inferior, but different—from that into which scientists (including economists) are socialized. “Economic/scientific” rationality seeks clarification and systematic comparison of objectives to optimize resource use. “Political rationality” is more concerned with the viability of a decision-making process. Building support, while averting future opposition, is paramount. Clarifying objectives is irrational when it increases conflict.^[19] More than anything else, the repeated failures of budget reforms must be attributed to reformers’ failure to acknowledge the institutional realities of legislatures. To remedy these failures, prescriptive theory should help legislators to behave in ways that encourage and reward desirable behaviors in agencies.

Needed: Institutionally Savvy Descriptive Theory

Budget reforms have been sociologically and psychologically naive. Unfortunately, the wonderful descriptive work of such scholars as Fenno^[24] and Wildavsky^[2] fell from favor; displaced by a generation of effort to statistically model such concepts as incrementalism. A more inclusive institutional framework is now needed to gain understanding of how budgeters and other financial decision makers actually behave. Miller’s^[25] proposal to use anthropologically oriented methods to observe how financial decision makers cope with ambiguity, frame their identity, and make sense of things is an important step toward building institutionally sensitive theory. So also is James Perry’s^[26] proposal of a theory of motivation that seeks to understand the behaviors of public officials within a sociohistorical context. The motivations of public officials can only be understood in the context of their socialization and membership in institutions.

Given legislatures’ reluctance (or inability) to sustain pay for performance, it seems wise to explore how public managers’ non-economic motivations might be tapped. For example, public managers desire greater discretion—that is, more leeway in using their judgment. An ingenious proposal to tap the motive force of discretion, while carefully holding managers accountable for their actions, was once proposed by three experienced federal administrators.^[27] It was not a proposal from self-serving/budget-maximizing bureaucrats. Discretion-oriented reforms would require public managers to become more openly

accountable and less able to hide behind information asymmetries.

Professional Norms

Where public managers are effectively socialized to internalize values of stewardship, service, and freedom of information, value seeking on behalf of the public is more likely to occur. Public managers who seek personal fulfillment through service to others will act differently than managers who only believe in economic motivation. Reformers who seek to promote better use of information and legislators who depend on information supplied by “bureaucrats” should encourage public service professionalism when it shows itself to be dedicated to the remedying of information asymmetries. Unfortunately, attention to professional norms has been woefully absent in both descriptive and prescriptive public financial management theory. The Progressive tradition, including its emphasis on the motive and constraining force of professionalism, should be relearned and emphasized.^[28]

Conclusion: Behavioral Interventions Essential to Reform

Any budget reform seeks to alter established behaviors. Many of these behaviors are deeply rooted legislative routines. Surprisingly, no reform to date has included carefully fashioned behavioral strategies for altering institutionalized behaviors. Not recognizing the rationale or staying power of institutionalized behavior patterns, reformers have unwittingly sewn the seeds of failure. Within social sciences, a large body of theory has been developed throughout the twentieth century regarding the altering of established behaviors. Organizational development, with its many strategies for intervention to achieve organizational change, is a well-established area of practice. Yet, with few exceptions,^[29,30] theorists have not recommended any methods of organizational development to enhance the prospects of budget reforms.

Institutional change requires sustained commitment from top leaders, but many legislatures, especially those with term limits, experience frequent leadership changes. Elected officials are unlikely to attend the lengthy meetings that planned organizational change requires. Consequently, senior staff members in budget offices and appropriations committees (who have often resisted budget reforms as much as their elected bosses) should be the leaders targeted in behavioral change interventions. Their roles as repositories of institutional memory, as well as trusted advisors, give senior staffers an institutional status from which to “champion” behavioral change on a sustained basis.

If top staff members can be assisted to learn how to modify routines to better use analysis, they are in a unique position to help their elected officials change the decision processes. One desirable change would be learning to substitute performance-oriented reviews for traditional inputs-oriented hearings. Another would be learning to make necessary political trade-offs without detailed line item formats. Still another would be to fashion ways to make legislators aware of the disincentives that they create for public managers. One thing, however, is certain. No change in the deeply rooted routines of legislatures (and elected chief executives) will be possible without a sophisticated understanding of the institutions within which budgeting is done. With institutional insight, though, it may someday be possible to institutionalize positive incentives for good public administration.

Municipal Securities

Mark D. Robbins

University of Connecticut, Storrs, Connecticut, U.S.A.

Bill Simonsen

Center for Policy Analysis and Management, University of Connecticut, Storrs, Connecticut, U.S.A.

INTRODUCTION

Municipal securities are the subset of financial instruments that represent the debts of state and local governments, their agencies and authorities. The power to create municipal obligations lies in each state's constitution and statutes. Only the power to issue debt on behalf of the federal government is proscribed by the U.S. Constitution. Local governments maintain the ability to borrow and tax at the pleasure of their state governments, which retain all powers necessary to set the conditions and limits on these obligations. Markets for municipal securities exist primarily at the state and national levels. International (foreign denominated) municipal securities are issued by U.S. governments, but represent a very small share of the market.

Investors purchase bonds entitling them to future principal and interest (also called coupon) payments. Interest earnings from state and local government bonds are exempt from federal income taxes. States with income taxes typically exempt their own bonds from their own income tax. The effect of these exemptions is to decrease the interest rate necessary to offer investors in order to persuade them to purchase the bonds. In practice, this amounts to a subsidization of government borrowing provided from the federal (and state) governments. Governments use the subsidy to finance their capital projects, while maintaining low borrowing costs.

TYPES OF REPAYMENT SECURITY

Municipal bonds are the most common government security. These government obligations must be backed by a security pledge that demonstrates to investors the source of revenue that will be used to repay the debt. All else being equal, the price of bonds falls as this security pledge appears weaker and less certain. The strongest pledge is the full faith and credit pledge

that assures bond holders that the government will use its full taxing power to raise the revenues necessary to repay the debt. If that taxing power is unlimited, the security is referred to as a general obligation unlimited tax bond. Many governments operate under state or local tax limitations or other authority that limits their ability to raise taxes. General obligation limited tax bonds carry a full faith and credit pledge that is limited by such a revenue-raising restriction. Both forms of general obligations may face statutory or constitutional debt limitations or requirements for voter preapproval.

The classification of revenue bonds is used to designate the group of securities supported by a specific revenue stream rather than general tax support. These securities are paid for by government enterprise proceeds such as toll revenue or utility charges. Because they do not obligate taxpayers directly, they typically do not carry legal requirements for citizen approval.

Revenue bonds come in various forms, the most common of which are enterprise revenue bonds. These are single-party bonds in which the issuer dedicates its own specific enterprise revenues to repay the debt. An example would be bonds issued by a sewer authority that uses rate payments as the security to repay the bonds.

Lease revenue bonds are more complex structures involving more parties. Lease-backed bonds are repaid from the proceeds of operating leases—typically for buildings leased by government agencies and authorities. In these cases, an authority is created to build and operate facilities that are leased to a larger government or government agency. The government agrees to make lease payments, and the lease payments (or the promise of future lease payments) are used as security for the bonds. This security pledge is considered riskier than a dedicated revenue source because the payments are subject to the continued participation of the lessee government. Other restrictions may apply, including non-appropriability in which governments are forbidden from making multiple-year financial commitments

and contracts without statutory authority or voter permission.

Certificates of Participation offer investors an interest in the lease proceeds resulting from the payments to governments in exchange for the use of real property, equipment, and vehicles. These are riskier still because governments retain the right to halt appropriations for such lease payments at any time and because investors own a share of the lease proceeds as opposed to a specific repayment pledge. Certificates of Participation are often issued by government association lease pools that operate on a revolving fund basis to finance the capital purchases (typically vehicles and equipment) of participating jurisdictions. The pool is used to finance the purchases, and then lease proceeds are used to pay back the pool and cover the payments to investors. In this way, governments can access the capital market for the financing of relatively small capital items. This can be particularly attractive to smaller governments that would not otherwise access this market.

There are other types of tax-backed obligations, such as special assessment bonds, where taxes are pledged only for certain geographic areas. Tax increment bonds are obligations where only the increment in assessment for a certain geographic area after a specified point in time is subject to taxation for bond repayment.

State and local governments may also issue notes. Notes represent the short-term obligations of governments, typically (but not exclusively) maturing in 1 year or less. A common need of governments is to obtain interim financing for a project for which other revenue sources are anticipated. Tax anticipation notes and revenue anticipation notes are issued and secured by future tax or other revenue receipts, whereas bond anticipation notes are issued pending the conclusion of a long-term bond sale. Hybrids, such as tax and revenue anticipation notes, are also issued. Because of their short term, notes are considered riskier obligations than longer-term bonds and because investors are subject to greater interest rate risk and liquidity concerns.

Tax exempt commercial paper (TECP) is an alternative to notes and typically carries shorter maturities. Tax exempt commercial paper is typically purchased by commercial banks and institutions. The proceeds might be used by governments seeking to finance the construction phase of a project without incurring long-term debt until its completion, or seeking to delay the sale of longer-term obligations in anticipation of lower interest rates. Like notes, TECP is governed by legal authority separate from that of municipal bonds and results in higher relative borrowing costs on issuers.

Moral obligations state the good intentions of a government—without promising a specific revenue

source to repay a debt. This pledge indicates the government's recognition that they are morally, if not legally, obliged to cover the default of subsidiary agencies and authorities, without issuing a full faith and credit pledge and its accompanying voter approval requirement. The phrase was first added to bond covenants in the 1960s, when New York State bond counsel John Mitchell sought to make that state's issues more attractive to investors. This evasion of voter approval was apparently intentional by design. When asked decades later whether he created moral obligation bonds to bypass the referendum and initiative petition processes, Mitchell reportedly replied, "That's exactly the purpose of them."^[1] Rating agencies typically overlook the moral obligation pledge, basing their judgment on the creditworthiness of the specific issuer and the strength of the project revenue stream.

Additional forms of municipal securities include repurchase agreements and reverse repurchase agreements in which governments purchase or sell securities under the condition that the securities will be purchased or repurchased at a later time. These are primarily used as sources of short-term borrowing (or investment) by local governments.

ISSUANCE PROCESS

In addition to the government that creates and sells securities, there are many additional participants in the issuance process (Fig. 1). The participants include the issuing government, the underwriter or banking firm that purchases and remarkets the bonds, and the investors who buy the bonds from underwriters. Also involved are financial advisors, bond counsel, and members of the ratings and insurance firms that evaluate the issue prior to its sale.

Most governments are small and issue few if any municipal bonds in a given year. As a result, the internal

Fig. 1 Participants in the municipal securities issuance process.

capacity of a government to successfully oversee all aspects of these transactions is limited. In part to compensate for this, governments employ a series of expert consultants to guide them through the process. The financial advisor is one of these consultants, and may be hired to help with all or some subset of the steps of issuance from structuring the bond issue to overseeing the sale. There are two types of financial advisors—*independent financial advisors* and *underwriting financial advisors*. Independent financial advisors have no fiduciary interest in bond sales and work exclusively in the interest of issuing governments, helping to structure, size, and time the bond sale so that the government gets the best (highest) possible price for its bonds. Underwriting financial advisors work purchasing and reselling municipal bonds, in addition to providing governments with expertise about the bond sales process. In some states, underwriting financial advisors are permitted to purchase the bonds of the governments for whom they provide advice.

Each government security issuer obtains a legal opinion from bond counsel prior to the sale of their securities. These attorneys are hired to certify that the sale is conducted in accordance with all applicable statutory and constitutional authority, and that the interest payments received by the bond holders will be exempt from (state and) federal taxes. Bond counsel may also be involved in creating the official statement—offering the securities for sale, establishing the mechanisms for holding the proceeds of the bond sale, and determining the maximum allowable earnings jurisdictions may legally accrue on these proceeds pending their use.

Once an issue has been approved for sale, the issuer will select an insurer (if any) and a ratings firm (if any). Both will examine the condition of the jurisdiction and make a determination of creditworthiness. This determination will affect the rating assigned by the firm and the premium charged by the insurer. Once in place, the ratings and insurance signal investors about the riskiness of the issue.

Issuers must choose a method to sell their bonds. They may select a competitive or negotiated sale, a private placement, or an online auction. Private placements occur when a government issuing a small amount of bonds sells them directly to one bond holder, typically a bank or financial institution. Larger sales typically require the use of an underwriter to act as an intermediary, buying the bonds from the issuer and reselling them to investors. In the case of a negotiated sale, an issuing government selects an underwriting firm, sometimes through the use of a request for proposal. The underwriter premarkets the bonds by lining up investors in advance and then negotiates with the government about the interest rate that it will have to pay. When selling bonds

competitively, issuing governments solicit sealed bids from as many underwriters as possible. The bids show the interest rate that the underwriting firm is willing to accept to purchase and remarket the bonds. The underwriter presenting the lowest interest cost wins the right to purchase the bonds. In both competitive and negotiated bond sales, a single underwriter (or a syndicate composed of several underwriters) purchase(s) the entire bond issue, reselling the individual bonds to investors later.

In November 1997, Pittsburgh, Pennsylvania, initiated the first online auction of (new issue) municipal bonds. This system is a form of competitive sale that allows issuing governments to coordinate a bond sale by collecting bids over the Internet. One of the innovations of this method of sale is that investors may bid on as many or as few of the bonds as they like, thus opening the bidding process to parties (e.g., individual investors) that seek to purchase less than the entire bond issue and potentially bypassing underwriters altogether. Since that first sale through July 2001, MuniAuction, the company pioneering the technology behind this innovation, has concluded more than 2300 online sales. This method continues to grow in prevalence.

The responsibilities of the government do not end after the sale is consummated. Issuing jurisdictions are required to establish and maintain a regular payment mechanism to assure that bond holders receive interest and principal when they become due. This responsibility is typically assigned to a registrar payee—a firm specifically in the business of monitoring and completing such transactions. Governments with outstanding municipal bonds are required to make regular disclosures to bond holders and the public regarding events that may materially affect their financial condition and ability to repay the obligations. This responsibility is typically satisfied by the submission of annual financial statements to a nationally recognized municipal securities information repository, which disseminates the information. It is the responsibility of the issuer to disclose in the same fashion any interim event that may materially affect repayment ability.

RATINGS AND CREDIT ENHANCEMENT

The default rates of municipal securities is generally considered to be low compared with other sectors of the financial markets. The truth of this maxim depends on the sector of the tax exempt market that is being observed. Fitch IBCA reports a cumulative default rate of 0.26% for general-purpose tax-supported bonds for the period from 1979 to 1986. This compares with a corporate bond default rate averaging 2%.^[2] Industrial

development bonds (used to extend tax-free borrowing to private sector corporations in an effort to promote economic development) carried a default rate of 14.89%—a default rate exceeded only by corporate securities rated BB or worse. The Tax Reform Act of 1986 limited the circumstances under which governments could issue industrial development bonds, and the volume of such financings (and associated defaults) has subsequently decreased. Total defaults have consequently decreased as a percentage of total issuance across all municipal bond sectors from an average of 1.49% (1979–1986) to 0.87% (1979–1994).

Governments selling bonds and other securities pay rating agencies to evaluate their creditworthiness and publish a rating that is made available to investors selecting the securities that they will purchase. In some cases, governments will purchase more than one rating to provide further certification of the value of their bonds. Jurisdictions that want to gauge their ratings in advance may purchase ratings not subsequently released to the public. These are referred to as “preliminary ratings.”

The municipal bond rating industry is robust, with three prominent firms rating most of the issuance volume. This presents a conundrum. Given the low overall default rates of municipal securities and the failure of rating agencies to anticipate some notorious defaults (e.g., Washington Public Power Supply System, Orange County, California), the value of a bond rating system to help investors to predict default risk might appear nominal in this market. So why do governments continue to pay to be rated? The power of the rating mainly lies in the collective psychology of investors, not only in some intrinsic value of the ratings themselves or their ability to signal default. Ratings are used as a quality heuristic by investors. As long as some investors continue to rely on ratings, they remain significant determinants of bond prices. Issuers care about ratings because investors pay attention to them, and investor interest determines the amount of money municipalities can raise when selling their bonds.

Bond ratings also have an unintended, but positive, influence on government management. Bond ratings are viewed broadly as the independent evaluation of the quality of a government's management practices, as well as its economic and financial condition. The Aaa rating (the highest obtainable) is coveted by public managers as a sign of their superior performance. A private system of regular independent evaluation of governments has thus evolved that managers and the public pay attention to, and that may help point governments toward improved performance.

Many municipalities purchase insurance for their bonds. Bond insurance pays interest and premium payments in the case of a bond default. The premium for

the insurance is paid in full at the time of the closing of the bond sale. Because many municipal bond issues are refunded (refinanced) prior to their final maturity date, it is common for issuers to pay for more insurance than they actually use. Nevertheless, issuers purchase bond insurance because insuring an issue guarantees a Aaa rating and is expected to produce higher bond prices. Issuers already obtaining Aaa ratings without the use of insurance sometimes purchase additional ratings in an attempt to certify to investors the unanimity of good opinion about the quality of the repayment security.

UNDERSTANDING BORROWING COSTS

Citizens, government analysts, and managers are concerned about the costs that governments face when borrowing money. Because of the number of parties and provisions involved when issuing municipal securities, these costs are not always transparent. The relationship between various security features and the costs that they impose can be complex and unanticipated. Much research has examined the determinants of interest costs for municipal bonds, and this work has developed some consistent lessons about these costs and their determinants.

Several characteristics tend to increase the cost of borrowing, all else equal. These factors include longer maturity lengths, borrowing very large or very small amounts of money, the presence of a call provision (allowing issuers to pay off bond holders prior to maturity), poorer ratings or the absence of ratings, the complexity of the financing and security pledge, issuance during volatile or high interest rate markets, and sale through negotiation. Factors expected to lower interest costs for borrowers include shorter maturity lengths, the presence of a put provision (allowing investors to demand redemption prior to maturity), the use of credit enhancement such as bond insurance, issuing general obligations as opposed to revenue bonds, and selling these bonds through a competitive (multiple bidder) sales process.

CONCLUSION

Governments borrow money for various reasons, including the need to maintain liquidity, to obtain interim financing, and to support the construction of major capital projects. The selection of a particular type of municipal security needs to match the needs of the issuer at a particular moment in time, but each type of security possesses certain attributes that make

it more or less attractive to governments and investors. These attributes, and the mechanics of the bond issues themselves, combine to present governments with a series of trade-offs when selecting a financing mechanism. Government managers need to understand these trade-offs when pursuing project financing.

Narrative Inquiry

Sonia M. Ospina
Jennifer Dodge

*Robert F. Wagner Graduate School of Public Service, New York University,
New York, New York, U.S.A.*

INTRODUCTION

Narrative inquiry is a unique approach to qualitative, interpretive research that draws on diverse interpretive theoretical traditions. It directs attention to narratives as a way to study an aspect of society, and is not only about studying written or visual texts, but finding meaning in stories people use, tell, and even live. Narrative inquiry can be located within a constructionist epistemology and an interpretive theoretical perspective, and it has specific features that make it a unique interpretive approach. What distinguishes it from other methods is the focus on narratives and stories as told, implicitly or explicitly, by individuals or groups of people. For public administration research, this often translates into an emphasis on the meaning of administrative experience or practice communicated through stories.

Within this broad orientation, three distinct approaches to narrative inquiry can be identified: narrative as language, narrative as knowledge, and narrative as metaphor.^[1] While these approaches share basic assumptions, they draw on distinct theoretical perspectives that emphasize one of three core assumptions about the nature of narrative. Together they provide a rich array of methodologies to understand administrative experience and practice.

FOUNDATIONS OF NARRATIVE

Narrative inquiry has its roots in “constructionist epistemology,” a theory of knowledge that suggests that we know the world not by objectively observing an external reality, but by constructing how we understand it with others.^[2,3] Proponents pose that all meaningful reality is socially constructed. By implication, narrative inquirers do not claim to document “reality,” but to capture individual interpretations of reality, as well as shared social constructions among a given community. Hence, narrative inquirers usually adopt an interpretivist, rather than positivist, theoretical perspective.

Interpretive research aims to understand the dynamics of social phenomena rather than explaining it causally or predicting it. In contrast to the positivist

goal of identifying and testing causal relationships to predict behavior, interpretive research illuminates meaning to build, test, and elaborate theory that emphasizes the intentions, beliefs, and values of social actors. Those following this tradition assume that meaning can be better unveiled and understood through experience and practice, always mediated through language and narrative.

Its focus on narratives and stories as told, implicitly or explicitly, by individuals or groups of people, distinguishes narrative inquiry from other interpretive approaches. While much discourse and content analysis are about studying written or visual texts, narrative analysis is about finding meaning in the stories people use, tell, and even live. Three basic assumptions are at the core of narrative inquiry: First, narratives convey meanings—intentions, beliefs, values, and emotions—that reflect situated social reality, rather than an “objective reality” *per se*.^[4] Second, narratives carry practical knowing that individuals gain through experience^[5] so that creating and passing on knowledge requires crafting and telling stories from experience.^[6] Third, narratives are both *shaped by* individuals for their own purposes and they become forces that shape human beings, giving meaning to the social worlds they inhabit.^[3] This means that narratives are constitutive.

MULTIPLE FACES OF NARRATIVE INQUIRY

The relative weights that researchers give to each of the three assumptions of narrative inquiry translate narrative theory into very different research practices, with implications for data collection, analysis, interpretation, and data presentation.^[1] Each of these three approaches is built on a primary narrative assumption with implications for its view of how people understand and experience the world. Similarly, each serves a different research purpose, and therefore privileges different methods (see [Table 1](#)). These three approaches represent ideal types of narrative inquiry, each highlighting one assumption over the others, while still drawing on all three.

Narrative as language gives priority to the assumption that narrative is a medium of expression, thus

Table 1 Three approaches to narrative inquiry

Narrative as ...	Primary assumption	Implications of primary assumption for how people experience the world	Purpose of the inquiry	Methods
Language	Narrative is a medium of expression	People <i>create and use</i> stories to communicate meaning	To understand some phenomenon from the perspective of the person/people experiencing it	Systematic Comparative Looks for common patterns
Knowledge	Narrative is a way of knowing	People <i>think and know</i> through stories Narratives contain knowledge	To surface tacit knowledge or share theories in use To enhance practice, or draw lessons from practice	Comprehensive Looks for and elaborates exemplars
Metaphor	Narrative is a symbol of deep structures of meaning	People <i>are born into or enter</i> (i.e., are socialized into) existing stories or storied institutions	To unveil implicit shared meanings To offer alternative interpretations of accepted views	Deconstructive Looks for taken-for-granted structures of meaning

highlighting the social nature of language and its function for making interaction possible. Drawing on phenomenological perspectives,^[2] this view emphasizes that people create narratives to convey meaning about their experience. Narratives are thus useful for studying how people understand a topic, for example, organizational change.^[7] Narratives help researchers understand actors' experience or at least the version of experience that the narrators choose to convey. This way, narratives illuminate something about the constructed reality they reflect and about the experience and intentions of those engaged in it.

An important implication of this assumption is that people are *purposeful* social agents who *create and use* stories to communicate meaning to themselves and others.^[4,7] The researcher attempts to understand experience from the perspective of those enacting it, drawing on meanings and arguments embedded in the actors' words. Since language reflects individuals' understanding of reality, the researcher gets a glimpse of the social world, as filtered by the meaning-making process of those who experience it.

Scholars interview informants to collect stories that serve as windows to their world. These are tape recorded and transcribed to fully and accurately capture what was said, including non-verbal cues like pauses. Analysis involves surfacing participants' sense making about the world. Systematic comparative analytical techniques distill form, content, and structure of stories, reflecting a qualitative orientation that looks for patterns of experience across stories and sites. In public administration, analysis often focuses on the narratives of multiple people with common experiences. Scholars assume that we learn something new by shifting focus from structural or behavioral aspects of public institutions to the ways in which actors' make sense of their experience in governance.^[8]

Feldman and Skoldberg represent this approach.^[7] By generating stories from open-ended interviews in two U.S. city administrations, they provide an account of how administrators made sense of change processes, thus illuminating political decision-making and organizational change. They used a special type of narrative analysis, called rhetoric, which involves dissecting the form and structure of arguments made in stories to uncover the meanings behind organizational realities.

The second approach, *narrative as knowledge* also privileges individuals' interpretations of their experiences, but focuses on their immediate practical use. It prioritizes the second assumption, that narrative is *a way of knowing*: people use stories to draw knowledge explicitly from their lived experience. This view emphasizes the potential of storytelling to generate understanding and practical learning.^[9] Bruner, for example, argues that we construct the world through narrative, and describes storytelling as one of two complementary ways to order experience.^[6] Logical proof, tight analysis, argumentation, and hypothesis-driven discovery contrasts with the narrative mode which focuses on good stories that convince through lifelikeness. Lifelikeness lends practical insights by allowing us to compare others' experience to our dilemmas, thus drawing useful lessons.^[10] Because people think and know through narratives, narrative inquiry offers a unique tool to learn about practical knowledge.

This approach has several common features, though connections to various theoretical heritages produce different applications. First, narrative as knowledge draws attention to the learning embedded in stories about practice. Second, it assumes that these forms of knowing produce insights from which to draw generalizations to enhance future practice,^[11] and can be accessed through practitioner reflection.^[12] The immediate goal is to illuminate tacit knowledge or

“theories-in-use” implied in stories and embedded in the accounts of practice,^[12] to ultimately draw lessons that enhance practice.

In this approach, rather than doing systematic comparative analysis of bounded stories, the analyst creates a comprehensive story of experience, highlighting extraordinary successes or failures, or simply insights about practice. Explicit tools help gain access to the insights embedded in day-to-day practices, to make them available for others.

In one way of implementing this approach to narrative, reflective practitioners tell their own story^[11,12] or analysts draw from written or verbal accounts of those reflections as a way to build theory from practice. Another strand of this approach relies on action-oriented forms of inquiry such as action research, action learning, action science, and appreciative inquiry.^[10] Through conversation, scholars help practitioners’ understand and act on their own environment. For some, the inquiry focuses on problem identification and action planning, giving priority to practical reasoning over instrumental reasoning, and seeking to integrate theory and practice.^[9] Another variation combines storytelling with observations and documentation, to produce an overarching account with plot, characters, and chronology. The new narrative is the product of the analyst’s sense making around stories told and heard over time, distinct from the typical case study, a historical narrative, or a traditional ethnographic account. An example is Behn’s work on the implementation of large public management reform efforts, where he draws lessons for leadership from the way various actors tell about their perspective of the experience, combined with his own interpretation of additional documents and narratives.^[13]

Both narrative as language and narrative as knowledge privilege informants’ interpretations of immediate experience. The third approach attends to the influence of broader institutional contexts on people’s ability to fully understand the complexities that inform their experience.

Narrative as metaphor emphasizes the assumption that narratives are constitutive. In this view, notions of self, existence, identity, and the like are “named” through language, and begin to feel “real” in their consequences. People take these notions for granted as objective and pre-existing realities. Over time, this process becomes automatic and usually unconscious.^[2] Moreover, subjective interpretations and associated actions are influenced by historical and institutional contexts that already offer manufactured meanings, manifested in discourses (like “the American dream”), in institutions (like the health system), or even in practices (like performance evaluation). People contribute to the (re) creation of these external “institutions of meaning” that then stabilize an “order of things.”^[14]

These institutions of meaning can be read as “expressive statements” or “texts” with a particular grammar, syntax, and structure that send normative messages and regulate social life, similar to what postmodernists call the “grand narratives” of a society.^[15] Drawing from hermeneutics, critical theory, and poststructuralism, researchers in this approach view narratives that apparently reflect straightforward social practices as metaphors capturing deeper meanings about the social order. For example, the way office space is assigned in an organization is a metaphor for structures of power. Emphasizing narrative as metaphor helps the researcher attain deep understanding of practices, organizations, institutions, or systems.

An important implication of these assumptions is that individuals are born into or enter (through socialization) existing stories or storied institutions. As human creations, these institutions gradually take on a life of their own and affect people without their awareness. Hence, the primary goals of this approach are to unveil the powerful but often invisible meanings embedded in institutional life and to identify suppressed or competing narratives thus proposing alternative interpretations.

In contrast to the microperspective of the first two approaches to narrative, this approach adds a macroperspective that links the immediate experience of social actors to broader institutions of meaning. The analyst chooses methods to critique and deconstruct texts, rather than taking them at face value, and tries to do an analysis that considers, in a recurrent way, meanings that are abstract and concrete, general and particular, evident and hidden. Analysts search for and re-examine claims to authority embedded in the text, and treat their own point of view as part of the reality under scrutiny.^[15]

Scholars of public affairs often use this approach to explore the nature of politics and policy making.^[16] Yanow, for example, studied how policy meanings were communicated to various audiences as the legislation to create the Israel Corporation of Community Centers (ICCC) was designed and implemented, and during its early years of existence.^[15] She argues that the difference between the intentions behind legislation and the final implementation cannot be understood simply as inadequate legislation or poor policy implementation but as part of a larger story about national identity.

CONCLUSION

Narrative inquiry is a tradition that is beginning to shift from the margins to the mainstream in public administration research. Unpacking the three approaches to

narrative inquiry clarifies the logic of this mode of interpretive research and illustrates its potential for illuminating the social dynamics of public institutions. They offer a rich set of resources from which to draw in designing interpretive inquiry. Clarifying their theoretical assumptions and methodologies can help those interested in designing narrative studies to advance interpretive public administration research. This type of inquiry complements traditional positivist research, contributes to make the field more pluralistic, and deepens our understanding of the processes, structures, and dynamics that constitute the theory and practice of public administration.

Narrative Policy Analysis

Emery Roe

Public Policy, Mills College, Oakland, California, U.S.A.

INTRODUCTION

Policy narratives are the arguments, scenarios, and other accounts about how policy and management have, can, and should proceed in ways that enable decision makers to take action, be they policy makers, their analysts, or others. More formally, policy narratives are scenarios (stories and arguments) that stabilize decision making for issues of high complexity, uncertainty, incompleteness, and conflict. Each narrative has a beginning, middle, and end (or premises and conclusions, if offered as an argument), and revolves around a sequence of events or positions in which something is said to happen or from which something is said to follow.

There are, of course, all manner of narratives in public policy. Some are really non-stories, in that they do not have their own beginnings, middles, or ends. Standard examples of non-stories are: (i) policy critiques that rebut arguments without telling their own stories and (ii) circular arguments whose beginnings, middles, and ends are by definition difficult to parse. Other narratives come to us as condensed stories. There are adages: The best is the enemy of the good; the opposite of good is good intentions. There are analogies: The abortion of a human zygote no more destroys life than a burning Home Depot destroys houses.

OVERVIEW

Most narratives in public policy, however, do have beginnings, middles, and ends. All such narratives, moreover, come with counternarratives; in semiotic terms, a story is marked by what it is not. Where critiques and circular arguments on their own serve only to undermine a policy narrative rather than replace it, a counternarrative offers up an alternative story or argument with its own beginning, middle, and end. You say *x*; I say counter-*x*; and unsurprisingly, both assertions, and many in between, subsist and thrive alongside each other for issues of uncertain, complex, incomplete, and disputed merits.

Policy narratives, though different in what is taken to be their merits, can share very similar structures. What crisis narrative do I have in mind? The earth

releases gases into the atmosphere that are then triggered by sunlight and lead to droughts, tidal waves, storms, and other natural disasters. No, not global warming, but rather Aristotle's theory of comets. Furthermore, crisis narratives are frequently linked. Africa for many is the seriatim crises of epidemics, droughts and refugees, underdevelopment, desertification and deforestation, failed states, declining incomes, and always-on famine. Or closer to home: Take a city to which you would not move. What's the problem there? Unaffordable housing, crime, inadequate public education, too much traffic, the inner city, too much growth, or too little of the right kind: all these or more?

While narratives are ubiquitous and importantly so in politics, policy, and management, you do not find "policy narrative" as an index entry in our leading textbooks on how to analyze, manage, and make decisions in politics and policy. The irony is that the policy analysis textbooks are themselves the stories we tell our people. We may disagree over whether or not "Rand Corporation begat . . .," "Planning, Programming and Budgeting System (PPBS) begat . . .," or "economics (no, public administration!) begat policy analysis, which begat implementation analysis, which begat public management, which begat the new governance theory . . .," but these creation myths are constantly retold in our graduate schools of public policy and management.

Myths? The American policy analyst and manager will, should he or she have a graduate career, come across the story that policy analysis rose from the ashes of failed public administration programs. Our European counterparts, in contrast, know—repeat—know that public administration begat policy analysis and that public administration has always been the welcoming parent to its prodigal children, be they now calling themselves implementation, public management or the new governance. Most graduate schools do not treat such foundation stories as myths—and understandably so. If they were "simply" the stories we told our people, then what sense would there be to our claims that these, rather than those, are the better methods for policy analysis and public management? If our house is built on sand, what purchase is there in saying one remodeling lasts longer than another? Without the link between PPBS and what

we have learned since, how would we justify an eightfold, sixfold, or fourfold path to policy analysis? After all, who can doubt that analysis begins in problem definition and ends . . . and ends in what, precisely?

For its part, narrative policy analysis begins and ends in stories we tell to make sense of and act upon issues that are often uncertain, complex, incomplete, and conflicted at the same time. The issues are uncertain when causal processes are unclear or not easily comprehended. They are complex when the issues are numerous, varied, and interdependent than before. They are incomplete when efforts to address them are interrupted and left unfinished. They are conflicted when different people can and do take different positions on them precisely because of the uncertainty, complexity, and unfinished business. Policy narratives are one major way to underwrite and stabilize our decision making in the face of any such amalgam of contingencies.

As many of the issues, which policy analysts and public managers are asked to address, are ill-structured problems, the stepwise policy process they conventionally summon to guide and justify their course(s) of analysis and action must itself be narrativized. It should also go without saying that the terms, “uncertainty, complexity, incompleteness, and conflict,” are themselves cast as narratives to differing degrees. Take something as central to social science as “interdependence.” The concept is notorious for its lack of agreed-upon empirical measures. Undertake a thought experiment then. What if instead of interdependence we had all along been talking about the Taoist notion of resonance? Instead of things being interdependent, they resonate with each other. Instead of being interrelated, things move and act in response to and in concert with each other. Even the slightest divergence in a foundation narrative can ramify through the development and application of that narrative thereafter.

DEFINITION

Exactly how does its own narrative go when it comes to narrative policy analysis? The terminology has varied and the process is by no means as mechanical as the following passage reads, but four steps are involved in a narrative policy analysis. First, the analyst identifies the dominant policy narrative(s) for the issue in question. Second, the analyst identifies the narratives that run counter to the dominant account. Third, the analyst compares the dominant policy narratives with the counternarratives to determine if there is metanarrative that can reconcile or accommodate these multiple, conflicting perspectives, without in the process slighting any of the oppositions. The last step is to determine if and how a metanarrative recasts the issue

in such a way that it is more tractable to conventional policy analytical tools of microeconomics, statistics, organization theory, and law and public management practice than were the original narratives, which the metanarrative embraces. If we are told that the policy narrative is one where $a \rightarrow b \rightarrow c$, can you imagine a counternarrative, where $(\text{not-}a) \rightarrow (\text{not-}b) \rightarrow c$ or where $a \rightarrow b \rightarrow (\text{not-}c)$? The conditions under which both the narrative and the counternarrative hold at the same time constitute the metanarrative.

As such, narrative policy analysis begins each analysis not with the conventional question in policy analysis, “What’s the problem?” but rather with “What’s missing?” What am I, an analyst or manager, not seeing or understanding? What is there in this ill-structured issue that could explain how the opposing positions could all be the case at the same time? What are the initial conditions, which, if I knew them better, connect the contrary elements in the narratives so that they are no longer mutually exclusive?

Note what has not been said. It is not claimed that all policy problems are wicked and all management ill-structured. It is not claimed that there is no such thing as power and that everything is relative. It is not claimed that there will always be a metanarrative, that it will always be just one metanarrative, and that it will always recast the problem more tractably. It is not claimed that narrative policy analysis is the only or the best way to treat amalgam issues of high contingency. Such policy issues require triangulation from very different directions, and narrative policy analysis is only one of the tacks that can be taken, especially when policy narratives and counternarratives fuel the issue.

EXAMPLE

Readers scarcely need to be told that the policy narrative in favor of the economic globalization of trade is a dominant scenario in numerous decision-making arenas, as witnessed by the many calls for trade liberalization, deregulation, and privatization to expand economic growth. As this is a highly contested area, there are counternarratives to the globalization narrative. Focus here on the opposing arguments put forth by environmental proponents of sustainable development. This opposition can be roughly divided into two camps: a “green” counternarrative and an “ecological” one.

The green counternarrative assumes that we have already witnessed sufficient harm to the environment owing to globalization and thus demands taking action now to restrain further globalizing forces. This counternarrative is confident in its knowledge about the causes of environmental degradation as they relate to

globalization and certain in its opposition to globalization. In contrast, the ecological counternarrative starts with the potentially massive but largely unknown effects of globalization on the environment, which have been largely identified by ecologists. Here enormous uncertainties over the impacts of globalization, some of which could well be irreversible, are reasons enough for no more globalization. Where the green counternarrative looks at the planet and sees global certainties and destructive processes definitively at work, those ecologists and others who subscribe to the ecological counternarrative know that ecosystems are extremely complex, and thus the planet must be the most causally complex ecosystem there is. The ecological counternarrative opposes globalization because of what is not known, while the green counternarrative opposes globalization because of what is known. The former calls for more research and study and invokes the precautionary principle—do nothing unless you can prove it will do no harm. The latter says we do not need more research or studies to do something—take action now—precisely because we have seen the harm.

In practice, the two environmental counternarratives are conflated. It is often argued, for instance, that agricultural biotechnology should not be promoted until we know it will not cause environmental harm—and anyway, you can't trust biotech companies, can you? Conflation, however, in no way reconciles the substantive contradictions between the opposing environmental narratives.

Which is the better counternarrative? Clearly, the ecological one is preferable over the green version, if only because it takes uncertainty and complexity seriously throughout, while its green counterpart goes out of its way to deny that any dispositive uncertainties and complexities are at work. Does this mean the ecological version is the better environmental counternarrative? That depends. Plainly, the ecological counternarrative is itself open to all manner of critique simply because of its reliance on the precautionary principle, e.g., I can no more prove a negative than I can show beforehand that application of the precautionary principle itself will do no harm in the future. That said, from the narrative policy analysis framework, critiques against the precautionary principle or for that matter against any environmental counternarrative are of little decision-making use, if they are not accompanied by alternative formulations that better explain how and why it makes sense to be environmentally opposed to globalization.

Is there at least one metanarrative that explains how it is possible to hold, at the same time and without being incoherent or inconsistent, the dominant policy narrative about globalization, its ecological and green counternarratives, and other accounts,

including critiques of both? Readers may have different metanarratives in mind, but the one I am most familiar with is the metanarrative about who claims best to steward the planet. The proponents of globalization and the proponents of the environmental counternarratives disagree over what is best for the environment, but both groups are part and parcel of the same technomanagerial elite who assert they know what is good for us. According to this metanarrative, we need free trade, the precautionary principle, more research, or whatever because we—the unwashed majority—cannot effectively steward our resources on our own with what we now have. While we may bristle against the condescension of these elites—who elected any of them to steward the earth?—it is patent that we must look for other counternarratives and metanarratives if we are to get out of the bind of trying to decide between the current candidates discussed so far.

Where are those other candidates? Clearly, part of the problem is that the counternarratives and the metanarrative just discussed are in no way specific enough to guide real-time decision making. For if ecosystems and the environment matter as much as each counternarrative argues, then they must matter to us, now, right now. Not tomorrow, not over the longer term of “sustainable plans for [name the resource],” but now. It is right now that decision making requires ecologists, environmentalists, and others to tell the operators in the control rooms of our large water supplies and electricity systems, for example, whether to open that water gate and save the manatee or close it and dry out the already endangered habitat; bring online that older generation plant to keep the lights thereby increasing air pollution; close down that pump to save the delta smelt but risk breaching urban water quality standards; or some equally urgent trade-off requiring choice. Yet neither counternarrative nor the metanarrative just discussed is detailed enough to answer these kinds of questions about real-time trade-offs.

CONCLUSIONS

Fortunately, entirely new fields are arising out of real-time decision making across our critical infrastructures and from these fields arise new policy narratives. Ecologists are increasingly in and around the control rooms making just such decisions, where “real-time ecology” is knowledge emerging out of the involvement of these ecologists (broadly writ) in the day-to-day, if not hour-by-hour, operation of our large water and hydro-power supplies. The involvement arises not out of the environmental counternarratives just discussed, but primarily because of specific legislative and regulatory

mandates for endangered species and habitat protection. Moreover, the knowledge is typically narrativized as advice to system operators by ecologists based on the latter's case-by-case analyses, their recognition and anticipations founded on patterns perceived in a run of cases, and their localized contingency scenarios for cases that have not yet occurred but might well do so—all applied “just-in-time” for management purposes. It is to these fields we have to look for new narratives, and these managers—be they control room operators or villagers—are very much the marginalized voices to whom *Narrative Policy Analysis* recommended we give much more attention.

ACKNOWLEDGMENTS

I thank all of those who have found the narrative policy analysis useful. Keying in “narrative policy analysis” into a Google search indicates far more sources than I could review for this short article.

National Security Policy

Eric K. Leonard

Shenandoah University, Winchester, Virginia, U.S.A.

INTRODUCTION

The events of September 11, 2001 dramatically altered the landscape of American national security. However, in many ways, this traumatic event may have clarified a flailing policy agenda, while reinvigorating the unilateralist position that is such a prevalent part of traditional U.S. national security policy. This article will examine the transformation of national security policy from the post–Cold War to the post–9/11 era. The primary method for examining this change will be the presidential doctrines/strategies that guided American national security policy during this period of history.^a This article will conclude by analyzing the parallels between the early Cold War doctrines and the current National Security Strategy of the Bush administration. Although it appears that both exhibit similar understandings of how to engage the world, one primary difference exists—the employment of preemptive strikes.

POLICY OPTIONS

Within the realm of U.S. national security doctrine, the policy options available to U.S. decision makers tend to fall into two categories: isolationist and internationalist.^b The isolationist option is probably the oldest form of national security policy dating back to George Washington's Farewell Address. In this address, Washington urged American policy makers to "steer clear of permanent alliances with any portion of the foreign world" because of the fact that "Europe has a set of primary interests which to us have none or very remote relations." The only rationale for extending foreign relations is "commercial interests." As for "political connections," Washington warned future policy makers against such ties. In short, the isolationist policy option advises that American decision makers avoid entangling relations with foreign nation-states. By heeding such prudent advice, Washington believed that the result would be a greater sense of national security.

Internationalists propose a more engaged form of national security policy. This policy option gained popularity as the international arena evolved from a disaggregated set of political entities to a more interdependent, globalized world. Internationalism promotes a national security policy agenda in which the United States actively pursues its national interest via involvement, not isolation. However, when discussing this policy option, one must also understand that several methods exist for achieving its goals. The two most prominent methods are unilateralism and multilateralism.

Unilateralism proposes that the United States promote its national security by pursuing its *own* agenda on its *own* terms. Any concern for allies and their interests, legal principles, and/or morality are all subservient to American national interest as defined by American policy makers. Thus a unilateralist policy agenda understands the need to engage the world, but always according to American interests and needs. There is no room for pandering to other global entities—whether they are nation-states or international organizations. Cooperation only occurs when those with whom the United States is cooperating accept the U.S. conditions for engagement. In short, a unilateralist perspective states that national security is best protected by a policy that engages the world according to U.S. national interest with no regard for compromise.

Multilateralists discuss engaging the world through more cooperative means, with cooperation meaning compromise between competing national interests. Advocates of this position recommend establishment of and adherence to international law, cooperative arrangements, and the defining of interests via a cosmopolitan perspective as opposed to an autonomous understanding of national interest. The resulting policy agenda would entail high levels of cooperation among nation-states and international organizations as a method for solving global problems, including issues of national security. Thus this perspective advocates the use of the UN as a forum for national security decision-making processes, along with a belief that international legal institutions are a quintessential tool for pursuing one's security interests. Consequently, multilateralists believe that cooperative/collective means are the best method for protecting American national security.

^aRef.^[1] is an excellent source of analysis concerning these doctrines.

^bRef.^[2] provides a detailed examination of these terms.

HISTORICAL OVERVIEW

Historically, U.S. national security policy has dabbled in all three of these policy options. Most scholars consider the pre-World War II era a time of isolationism, with moments of unilateralism (such as the Spanish-American War).^c However, with the outbreak of World War II, and, more importantly, the attack on Pearl Harbor, U.S. policy makers realized that an isolationist policy was simply not an option anymore. The world had become too interrelated for a rising hegemon to wall off its borders and exist in peace. Thus the United States began the modern period of internationalism.

In general, the Cold War appeared to be a time of unilateralism, with U.S. doctrine dominating any “cooperative” arrangements that may have existed. In other words, cooperative institutions did exist, but they existed on U.S. terms and were controlled by U.S. policy. American policy makers pursued their definition of national interest as they saw fit, with little regard for competing interests. But the Cold War period was more or less conducive to this type of environment. This was a time of ideological war in which the national security interests of two superpowers, the United States and the Soviet Union, dominated the global arena. Thus this power struggle not only defined American national security policy during the Cold War, but also the national security policies of the majority of the global community.

With the end of the Cold War, the United States enters a period of confusion concerning its national security policy. The Evil Empire is gone, the world appears safe from the scourge of global communism, and the liberal democracy stands alone as the victor. In such an environment, how does the global hegemon define and pursue its national security interests?

CLINTON'S POST-COLD WAR POLICY

With the onset of the post-Cold War era, President William Jefferson Clinton found himself searching for a national security directive. With the collapse of the Soviet Union, the United States lost its main adversary and the primary threat to its national security. As a result, the Clinton administration needed to redefine national security interests in an era devoid of liberal-communist ideological conflict. In September of 1993, President Clinton's first national security adviser,

Anthony Lake, established an outline for a new national security agenda.^[3] According to Lake, the new security strategy must entail an active engagement in the world “in order to increase our prosperity, update our security arrangements and promote democracy abroad.” This engagement would entail an attempt to: 1) strengthen the world's market democracies; 2) foster and consolidate new democracies and market economies where possible; 3) counter aggression and support the liberalization of states hostile to democracy; and 4) help democracy and market economies take root in regions of greatest humanitarian concern. According to Lake, the justification for such a policy was that, “our own security is shaped by the character of foreign regimes.” Thus it is imperative that the United States actively pursue a policy of engagement and enlargement.

This policy of enlargement had an air of multilateralism, or as UN Ambassador Madeline Albright characterized it, “assertive multilateralism.”^[4] According to the Clinton administration, American security was predicated on the proliferation of market democracy. If this ideological perspective took hold in all regions of the world, America's national security interests would be protected.^[5] However, this meant that the United States must actively pursue a policy of enlargement through the means of engagement. Isolationism was simply not an option in an era of globalization.^[6] The pursuit of national security now encompassed a broader definition of security than during the Cold War era, thus providing the Clinton administration with justification for a more active foreign policy agenda.

Somalia was the first and last real test for assertive multilateralism. Despite success in quelling the famine in Somalia, the catastrophic events of October 3, 1993 altered the direction of national security policy again. On that day, Somali rebels killed 18 American soldiers and then dragged their bodies through the streets of Mogadishu. As a result of the botched American mission and a public outcry against the American presence in Somalia, President Clinton began to rethink the notion of an expansive national security agenda. The result was Presidential Decision Directive 25 (PDD-25). This document, while still maintaining an internationalist foundation, initiated a period of more controlled multilateralism bordering on unilateralism.

PDD-25 limited the engagement policy to certain situations. According to this document, American intervention will only occur if the following conditions are present: 1) there must be an identifiable U.S. interest at stake in the operation; 2) the mission must be clearly defined in size, scope, and duration; 3) there must be sufficient resources, along with the political will to complete the mission; 4) there must be a tangible exit strategy in place; 5) the cost of U.S. involvement in multilateral peace operations must decrease.

^cThis statement on American isolationism is a generalization. True American internationalism did not take hold until the WWII era; however, moments of internationalism certainly permeated U.S. policy prior to the WWII period. One example of this internationalism is the Spanish-American War.

The first attempt at a national security policy predicated on multilateralism appeared to have fallen by the wayside. Although President Clinton maintained the rhetoric of a multilateralist, the practice was much more unilateral.^d Some prime examples of this unilateral pursuit of security are the following: the failure to engage in a multilateral military operation in Rwanda; the lack of support for the formation of a permanent International Criminal Court; the failure to pay UN arrears; the slow reaction to the decade-long crisis in the former Yugoslavia, among others. All of these situations are prime examples of the Clinton administration acting in a manner that benefits U.S. interests, but with little or no regard for the interests of others in the global community. Any intervention was to take place on U.S. terms with no room for debate or compromise. Consequently, one can classify the Clinton administration as striving for a multilateral security agenda, but ultimately falling into a more unilateralist one.^e

GEORGE W. BUSH AND SEPTEMBER 11TH

George W. Bush's initial stance on national security bordered on isolationism, not internationalism.^f At the outset of his term, Bush appeared to heed the advice of George Washington by publicly admonishing almost every multilateral arrangement that was under negotiation. Bush rejected the Kyoto Protocol, the land mines convention, and the small arms treaty; President Bush also unsigned the Rome Statute for the International Criminal Court and withdrew from the Anti-Ballistic Missile Treaty. The only form of multilateral arrangement that President Bush supported was economic/capitalist ones. If an international cooperative arrangement did not favor U.S. economic interests, then his administration felt it prudent to turn inward. However, the events of September 11, 2001 changed everything concerning U.S. national security policy.^g

With the tragic events of 9/11, the Bush administration realized the need to engage the world in a more

fundamental manner. The attack on the United States demonstrated that national security in the 21st century is not realized by isolating one's self. In fact, isolationism is not an option because of the globalization process. President Bush had to become an internationalist, but what means would he choose to pursue this policy of engagement?

In September 2002, President Bush published *The National Security Strategy of the United States of America*. In this document, President Bush outlines not only the means to national security, but also the enemy the United States is engaging and the values the United States must uphold. The explicit rhetoric of this document smacks of a multilateralist tone. For example, in the introductory section, the Bush doctrine states:

we [the United States] do not use our strength to press for unilateral advantage. We seek instead to create a balance of power that favors human freedom.

Again, in the opening section, the doctrine states:

We are also guided by the conviction that no nation can build a safer, better world alone. Alliances and multilateral institutions can multiply the strength of freedom-loving nations. The United States is committed to lasting institutions like the United Nations, the World Trade Organization, the Organization of American States, and NATO as well as other long-standing alliances.

However, the multilateral rhetoric is not about a cosmopolitan agenda of cooperation and compromise. Instead, the multilateral rhetoric extends only to situations in which the United States is in full control of the mission/organization. Thus the United States is committed to institutions such as the United Nations (as stated in the doctrine), but this is because of the fact that the United States has veto power over the UN's actions. This is the form of multilateralism the Bush administration favors—multilateral arrangements that not only favor U.S. interests, but also are controlled by U.S. power. The post-9/11 situation in Iraq is a prime example of U.S. unilateralism in action.^[12] The initial engagement of Iraq came in the form of multilateral efforts. The United States allowed the UN to play a role in the situation by collectively agreeing that the formation of a weapons inspection team was beneficial to the situation. However, when this team failed to find any weapons of mass destruction, the United States decided to intervene according to its own agenda.

At this point, the Bush administration disengaged the Iraq debate from the UN, in particular, the UN Security Council, because of the contentious nature of the topic. The United States knew that France,

^dThe National Security Strategy of Engagement and Enlargement [Ref.^[7]] document is one example of the constant struggle to find a middle ground between multilateral and unilateral methods.

^eThe Clinton administration did engage in some multilateral endeavors (such as leading the NATO airstrikes during the Kosovo crisis); however, if one is going to generalize about the administration's overall record on national security, unilateralism appears to be the primary method for achieving their defined goals.

^fSee Refs.^[8,9] for an understanding of Bush's initial national security agenda.

^gRefs.^[10,11] provide excellent analyses of the post-9/11 policy options.

Russia, and, possibly, China would veto any resolution authorizing a military intervention. Consequently, the United States chose to pursue its national security policy in a unilateral fashion, with the international community of states either standing by our side or getting out of the way. Some nation-states chose to stand by the United States and support our action (the coalition of the willing), but this ad hoc alliance of states was inconsequential to the action the United States was going to take. Bush had decided to invade, and no foreign power was going to alter this agenda. In the words of secretary of defense Donald Rumsfeld, "The mission must determine the coalition; the coalition must not determine the mission."

In the post-9/11 era, the United States begins a path toward unabashed unilateralism. In many ways, the events of September 11th have assisted U.S. policy makers in defining national security. During the Clinton years, the administration was left searching for a purpose for its national security agenda. There was no evil empire or ideological enemy. Instead, Clinton asserted that the promotion of free market liberal democracy would solidify American national security. However, in the post-9/11 era, a new focus/enemy exists—terrorism.

PREEMPTION AS A POLICY OPTION

As with the Soviet Union and its communist ideology in the immediate post-WWII era, U.S. national security policy now has a purpose—to combat terrorism. In the words of President Bush:

Defending our Nation against its enemies is the first and fundamental commitment of the Federal Government. Today, that task has changed dramatically. Enemies in the past needed great armies and great industrial capabilities to endanger America. Now, shadowy networks of individuals can bring great chaos and suffering to our shores for less that it costs to purchase a single tank. Terrorists are organized to penetrate open societies and to turn the power of modern technology against us.^h

The question that now looms is how to combat the enemy. During the Cold War years, the primary method for protecting American security interests was deterrence. In the post-9/11 period, the Bush administration has begun the use of preemptive strikes.ⁱ According to the Bush administration, because the enemy no longer fits the traditional nation-state

model, the old rules of engagement no longer apply. Deterrence was a plausible option when engaging other sovereign states that exerted a relative balance of power with the United States. However, the United States, or any other nation-state, does not have the ability to deter the current enemy (non-state terrorist organizations). Consequently, the use of force in a preemptive and preventive manner is necessary. Engaging in a policy of deterrence would simply result in future terrorist attacks like September 11th. The only way to prevent such tragedies is to strike first—as in Iraq.

The use of preemptive force is a new form of national security policy. Never before has the United States publicly called for the employment of a first-strike policy. But according to the Bush administration, the current era of "shadowy networks of individuals," whose use of weapons of mass destruction could perpetrate another September 11th or worse, necessitates the use of preemption. The Bush administration has altered the course of U.S. national security policy, but according to this administration, that is because the enemy has changed. A new enemy necessitates the initiation of new methods. The result is that preemption appears to be the future of national security policy.

CONCLUSION

The post-Cold War era is clearly a dynamic era full of rapid change. The national security policies of the two presidential administrations bear this fact out. With the onset of the post-Cold War era, President Clinton found himself having to redefine American national security. The ideological conflict between the Soviets and the Americans had disappeared and left U.S. policy makers with no clear security agenda. Clinton first initiated a multilateral policy agenda, but the conflict in Somalia quickly altered the method for obtaining and the definition of national security. The Clinton administration found it necessary to abandon much of the multilateral practices they had wanted to initiate for a more unilateral policy. However, even with this change toward unilateralism, the definition of what constitutes a national security threat was still unclear.

The events of September 11th provided President Bush with a specific enemy to center his national security policy around. Terrorism became the new threat to the American people, and in the vein of the Truman Doctrine and NSC-68, the Bush doctrine established a roadmap for how to protect the American people and eradicate the threat. The major difference between the post-WWII policies and the post-9/11 policies is notion of preemption. No longer does the United States wait to be attacked. President Bush, by his

^hRef.^[13] introductory section.

ⁱRef.^[14] contains an expansive discussion of the Bush doctrine's policy agenda and the premise of preemptive action.

actions in Iraq, has made it clear that when his administration perceives a viable threat to national security is in existence, the U.S. military will act. This sets the United States down an unprecedented course in security policy, one whose future, and the future of American national security, remains shrouded in doubt.

Natural Resource Policy: Institutional Aspects

Amy R. Poteete

Department of Political Science, Concordia University, Montreal, Quebec, Canada

INTRODUCTION

Policies for natural resource management contend with a number of challenges. The complexity of natural resource systems places a premium on scientific knowledge and strains the cognitive capacity of policy makers.^[1,2] Natural resource systems rarely correspond to political jurisdictions. Interdependencies across jurisdictions present administrative, strategic, and distributional challenges.^[3] While the scale of many resource systems increases the importance of cooperation across jurisdictions, spatial variability in resource conditions creates a contrary pressure for local management.^[4] Difficulties in limiting use present incentive problems even in the absence of problems related to complexity, scale, and local variability. How natural resource systems are conceptualized, the choice of management goals and time horizons, the scale of jurisdictions, and patterns of accountability all have important distributional consequences. This entry elaborates on scientific uncertainty, issues of scale and exclusion, and spatial variability as they affect natural resources and draws out the implications of each issue for natural resource policy.

SCIENTIFIC UNCERTAINTY, COGNITIVE LIMITATIONS, AND EXPERTISE

Each natural resource (e.g., trees and water) is part of a natural resource system (e.g., forests and rivers). Natural resource systems have multiple interdependent components, so that the condition of any resource depends on interactions with other parts of the system. Thus, the condition of trees in a forest depends on the condition of soils, groundcover, and animals, among other things. Interactions within a resource system can be quite complex, playing out over decades and operating through mechanisms that are not readily apparent. The complexity of natural resource systems presents cognitive, distributional, and democratic challenges.

Complexity poses a cognitive challenge whether one assumes full or bounded rationality. Fully rational decision makers maximize their utility by assigning values (utility) to each outcome and choosing the policy (or strategy) that yields the highest valued

outcome. When each policy yields more than one possible outcome, the capacity for rational decision making depends on the ability to assign probabilities to each outcome. If this is possible, decision makers can calculate their expected utility by summing the value of each possibility multiplied by the probability that it will occur. It is then possible to maximize expected utility.

The complexity of natural resource systems raises doubts about the applicability of expected utility theory to this policy area. Natural resource policies often involve significant risks, both because of the high degree of uncertainty about interactions within these complex systems and because decisions—or non-decisions—may lead to irreversible ecological changes. Expected utility calculations assume risk neutrality. There is considerable evidence, however, that most people avoid risky choices in favor of certain options or the status quo.^[5] Interactions in natural resource systems are often sufficiently complex that it is not possible to identify all possible outcomes or assign probabilities to outcomes. Under such conditions, calculation of expected utility becomes impossible.

Models of bounded rationality emphasize limited cognitive capacity and scarcity of attention. Limited searches and heavy reliance on cognitive shortcuts such as standard operating procedures generate suboptimal policy choices regardless of policy area. The interaction of bounded rationality with the complexity of natural resource systems has at least two important implications. First, unless a natural resource system shows dramatic signs of collapse, signals of resource strain may not catch the attention of decision makers until degradation is quite advanced. Second, the consequences of imperfect policy choices reverberate through natural resource systems in ways that may be partly or wholly irreversible. Thus, the shortcomings associated with bounded rationality are amplified in natural resource policy.

Scientific complexity also increases the influence of experts in the policy process.^[6] Experts are supposed to increase the rationality of policy making by expanding the information base and reducing uncertainty.^[6] But expertise exacerbates information asymmetries inherent in any delegation of decision making. The limited ability of non-expert supervisors and politicians to evaluate expert advice increases the scope for expert discretion and decreases capacity for democratic

accountability. Different experts prioritize different values: ecological integrity, sustainability, economic returns, human welfare, etc. Expert advice may deviate from democratically expressed preferences, whether by favoring ecological integrity over human welfare or by favoring some uses over others.

SPATIAL VARIABILITY AND (DE)CENTRALIZATION

Dramatically different microclimates develop in mountainous areas in response to aspect (e.g., southern or northern exposure) and elevation. In arid rangelands, pasture quality varies spatially and temporally with scattered rainfall patterns. The complexity represented by spatial and temporal variability challenges centralized policy making and implementation. Standardized national policies will be excessively restrictive in some times and places yet grossly inadequate in others, producing wildly divergent outcomes. In principle, locally variable policy can limit waste and degradation by adapting to local conditions. Context specific policy must be very detailed or allow considerable local discretion. Shortages of attention and administrative preferences for standard procedures exacerbate the inherent challenges of collecting and processing the tremendous quantities of information required for context-variable policy. Central decision makers rarely have the information or understanding required to identify all possible situations and devise detailed prescriptions for each.^[4] Furthermore, the viability of centralized management is limited by enforcement problems, especially when exclusion from a resource is difficult.^[7]
